ENCYCLOPÆDIA BRITANNICA.

FALABA, a town of West Africa, about 190 miles N.W. of Freetown in Sierra Leone, at the foot of the Konkodugor, and on the Fala River, a tributary of the Little Scarcies. It was founded by the Sulimas, who revolted from the Mahometan Foulas, and its warlike inhabitants soon attained supremacy over the neighboring villages and country. The defences consist of a lofty stockade, and a moat about 20 feet deep and as many in breadth. From a distance the town appears like a grove of silk-cotton trees, and only at intervals are the brown roofs seen peering through the foliage. Major Laing about 1825 estimated the number of huts at about 4000. They are arranged in clusters round squares or court-yards, and though only built of clay are neat and even elegant. Winwood Reade, who was detained in the town during his Niger journey in 1869, has given a graphic description of life in Falaba in his *African Sketch Book*, vol. ii., 1873. See also Laing, *Travels in W. Africa*, 1825.

FALAISE, a town of France, the capital of an arrondissement in the department of Calvados, is situated on the right bank of the Ante, 21 miles S. by E. of Caen. It was formerly a place of some strength, and is still surrounded by old walls. The principal object of interest is the castle, now partly in ruins, but formerly the seat of the dukes of Normandy, and the birthplace of William the Conqueror. Near the castle, in the Place de la Trinité, is an equestrian statue in bronze of William the Conqueror, by Louis Rodel. Falaise has two large and populous suburbs, one of which, Guibray, rivals in size and importance the town itself, and is celebrated for its annual fair, which lasts from 10th to 25th August. The town contains a town-hall, a hospital, a theatre, several ancient churches, and a public library. The manufactures are chiefly cotton goods, hosiery, leather, and paper. The population in 1872 was 7749.

FALASHAS (*i. e.*, Exiles), the degenerate Jews of Abyssinia, found in considerable numbers in the provinces west of Takazze, namely, Semien, Wogara, Armatshoho, Walkait, Tchelga, Dembea, Tenkel, Dagusa, Alafa, Kunsula, Aschafer, Agarv-Meder, and Quara. It is doubtful whether they are to be ethnologically identified with the seed of Abraham, or regarded, like the Khazars of the 8th century, as, for the most part, mere proselytes to Judaism. As to the date when the race or the religion was introduced there is no authentic information,—one account carrying it back to the days of Solomon and his hypothetical son Menelek by the queen of Sheba, another to the time of the Babylonian captivity, and a third only to the 1st century of the Christian era. That one or other of the earlier dates is probably correct may be gathered from the fact that the Falashas know nothing of either the Babylonian or Jerusalem Talmud, make no use of the *tephilin*, and observe neither the feast of Purim nor the dedication of the Temple. They possess —not in Hebrew, of which they are altogether ignorant, but in Ethiopic (or Geez)—the canonical and apocryphal books of the Old Testament; a volume of extracts from the Pentateuch, with comments given to Moses by God on Mount Sinai; the Te-e-sa-sa Sanbat, or laws of the Sabbath; the Ardit, a book of secrets revealed to twelve saints, which is used as a charm against disease; lives of Abraham, Moses, etc.; and a translation of Josephus called Sana Aihud. A copy of the Orit or Mosaic law is kept in the holy of holies in every mesgeed or synagogue. Various pagan observances are mingled in their ritual: every newly-built house is considered uninhabitable till the blood of a sheep or fowl has been spilt in it; a woman guilty of a breach of chastity has to undergo purification by leaping into a flaming fire; the Sabbath has been deified and, as the goddess Sanbat, receives adoration and sacrifice, and is said to have ten thousand times ten thousand angels to wait on her commands. There is a monastic system, introduced it is said in the 4th century A.D. by Aba Zebra, a pious man who retired from the world and lived in the cave of Hoharewa, in the province of Armatshoho. The monks must prepare all their food with their own hands, and no lay person, male or female, may enter their houses. Celibacy is not practised by the priests, but they are not allowed to marry a second time, and no one is admitted into the order who has eaten bread with a Christian, or is the son or grandson of a man thus contaminated. Belief in the evil eye or shadow is universal, and spirit-raisers, soothsayers, and rain-doctors are in repute. Education is in the hands of the monks and priests, and is confined to boys. Fasts, obligatory on all above seven years of age, are held on every Monday and Thursday, on every new moon, and at the passover (the 21st or 22d of April). The annual festivals are the passover, the harvest feast, the Baala Mazâlat or feast of tabernacles (during which, however, no booths are built), the day of covenant or assembly, and Abraham's day. It is believed that after death the soul remains in a place of darkness till the third day, when the first *taskar* or sacrifice for the dead is offered; prayers are read in the mesgeed for the repose of the departed, and for seven days a formal lament takes place every morning in his house. No coffins are used, and a stone vault is built over the corpse so that it may not come into direct contact with the earth. The Falashas are an industrious people, living for the most part in villages of their own, or, if they settle in a Christian or Mahometan town, occupying a separate quarter. They engage in agriculture, manufacture pottery, iron ware, and cloth, and are specially sought after for their skill in mason-work. Their numbers are variously estimated at from 80,000 to 200,000.

See Nott and Gliddon, *Types of Mankind*, 1868; Flad, *Zwölf Jahre in Abyssinia*, Basel, 1869, and his *Falashes of Abyssinia*, translated from the German by S. P. Goodhart, London, 1869.

FALCON (Latin, *Falco;*[1] French, *Faucon;* Teutonic, *Falk* or *Valken*), a word now restricted to the high-couraged and long-winged Birds-of-Prey which take their quarry as it moves; but formerly it had a very different meaning, being by the naturalists of the last and even of the present century extended to a great number of birds comprised in the genus *Falco* of Linnæus and writers of his day,[2] while, on the other hand, by falconers, it was, and still is, technically limited to the *female* of the birds employed by them in their vocation (see Falconry), whether "long-winged" and therefore "noble," or "short-winged" and "ignoble."

---

[1] Unknown to classical writers the earliest use of this word is said to be by Servius Honoratus (*circa* 390–480 A.D.) in his notes on *Æn.* lib. x. vers. 145. It seems possibly to be the Latinized form of the Teutonic *Falk*, though *falx* is commonly accounted its root.

[2] The nomenclature of nearly all the older writers on this point is extremely confused, and the attempt to unravel it would hardly repay the trouble, and would undoubtedly occupy more space than could here be allowed. What many of them, even so lately as Pennant's time, termed the "Gentle Falcon" is certainly the bird we now call the Gos-Hawk (*i. e.*, Goose-Hawk), which name itself may have been transferred to the *Astur palumbarius* of modern ornithologists from one of the long-winged Birds-of-Prey.

According to modern usage, the majority of the Falcons, in the sense first given, may be separated into *five* very distinct groups:—(1) the Falcons pure and simple (*Falco* proper); (2) the large northern Falcons (*Hierofalco*, Cuvier); (3) the "Desert Falcons" (*Gennœa*, Kaup); (4) the Merlins (*Æsalon*, Kaup); and (5) the Hobbies (*Hypotriorchis*, Boie). The precise order in which these should be ranked need not concern us here, but it must be mentioned that a sixth group, the Kestrels (*Tinnunculus*, Vieillot) is often added to them. This, however, appears to have been justifiably reckoned a distinct genus, and its consideration may for the present be deferred.

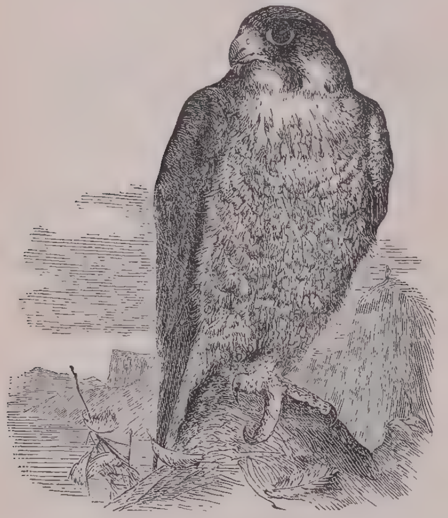

Fig. 1.—Peregrine Falcon.

The typical Falcon is by common consent allowed to be that almost cosmopolitan species to which unfortunately the English epithet "peregrine" (*i.e.*, strange or wandering) has been attached. It is the *Falco peregrinus* of Tunstall (1771) and of most recent ornithologists, though some[1] prefer the specific name *communis* applied by J. F. Gmelin a few years later (1788) to a bird which, if his diagnosis be correct, could not have been a true Falcon at all, since it had yellow irides—a color never met with in the eyes of any bird now called by naturalists a "Falcon." This species inhabits suitable localities throughout the greater part of the globe, though examples from North America have by some received specific recognition as *F. anatum*—the "Duck-Hawk," and those from Australia have been described as distinct under the name of *F. melanogenys*. Here, as in so many other cases, it is almost impossible to decide as to which forms should, and which should not, be accounted merely local races. In size not surpassing a Raven, this Falcon (fig. 1) is perhaps the most powerful Bird-of-Prey for its bulk that flies, and its courage is not less than its power. It is the species, in Europe, most commonly trained for the sport of hawking (see Falconry). Volumes have been written upon it, and to attempt a complete account of it is, within the limits now available, impossible. The plumage of the adult is generally blackish-blue above, and white, with a more or less deep cream-colored tinge, beneath—the lower parts, except the chin and throat, being barred transversely with black, while a black patch extends from the bill to the ear-coverts, and descends on either side beneath the mandible. The young have the upper parts deep blackish-brown, and the lower white, more or less strongly tinged with ochraceous-brown, and striped longitudinally with blackish-brown. From Port Kennedy, the most northern part of the American continent, to Tasmania, and from the shores of the Sea of Ochotsk to Mendoza in the Argentine territory, there is scarcely a country in which this Falcon has not been found. Specimens have been received from the Cape of Good Hope, and it is only a question of the technical differentiation of species whether it does not extend to Cape Horn. Fearless as it is, and adapting itself to almost every circumstance, it will form its eyry equally on the sea-washed cliffs, the craggy mountains, or (though more rarely) the drier spots of a marsh in the northern hemisphere, as on trees (says Schlegel) in the forests of Java, or the waterless ravines of Australia. In the United Kingdom it was formerly very common, and hardly a high rock from the Shetlands to the Isle of Wight but had a pair as its tenants. But the British gamekeeper has long held the mistaken faith that it is his worst foe, and the number of pairs which are now allowed to rear their brood unmolested in these islands must be small indeed. Yet its utility to the game-preserver, by destroying every one of his most precious wards that shows any sign of infirmity, can hardly be questioned by reason, and no one has more earnestly urged its claims to protection than Mr. G. E. Freeman (*Falconry*, etc., p. 10).[2] Nearly allied to this Falcon are several species of which it is impossible here to treat at length, such as *F. barbarus* of Mauritania, *F. minor* of South Africa, the Asiatic *F. babylonicus*, *F. peregrinator* of India—the Shaheen, and perhaps *F. cassini* of South America, with some others.

Next to the typical Falcons comes a group known as the "great northern" Falcons (*Hierofalco*). Of these the most remarkable is the Gyrfalcon (*F. gyrfalco*), whose home is in the Scandinavian mountains, though the young are yearly visitants to the plains of Holland and Germany. In plumage it very much resembles *F. peregrinus*, but its flanks have generally a bluer tinge, and its superiority in size is at once manifest. Nearly allied to it is the Icelander (*F. islandus*), which externally differs in its paler coloring, and in almost entirely wanting the black mandibular patch. Its proportions, however, differ a good deal, its body being elongated. Its country is shown by its name, but it also inhabits South Greenland, and not unfrequently makes its way to the British Islands. Very close to this comes the Greenland Falcon (*F. candicans*), a native of North Greenland, and perhaps of other countries within the Arctic circle. Like the last, the Greenland Falcon from time to time occurs in the United Kingdom, but it is always to be distinguished by wearing a plumage in which at every age the prevailing color is pure white. In North-Eastern America these birds are replaced by a kindred form (*F. labradorus*) first detected by Audubon, and lately recognized by Mr. Dresser (*Orn. Miscell.*, i. p. 135). It is at once distinguished by its very dark coloring, the lower parts being occasionally almost as deeply tinted at all ages as the upper.

All the birds hitherto named possess one character in common. The darker markings of their plumage are longitudinal before the first real moult takes place, and for ever afterwards are transverse. In other words, when young the markings are in form of stripes, when old in form of bars. The variation of tint is very great, especially in *F. peregrinus*; but the experience of falconers, whose business it is to keep their birds in the very highest condition, shows that a Falcon of either of these groups if light-colored in youth is light-colored when adult, and if dark when young is also dark when old—age, *after the first moult*, making no difference in the complexion of the bird. The next group is that of the so-called "Desert Falcons" (*Gennœa*), wherein the difference just indicated does not obtain, for long as the bird may live and often as it may moult, the original style of markings never gives way to any other. Foremost among these are to be considered the Lanner and the Saker (commonly termed *F. lanarius* and *F. sacer*), both well known in the palmy days of Falconry, but only within the last forty years or so re-admitted to full recognition. Both of these birds belong properly to South-eastern Europe, North Africa, and South-western Asia. They are, for their bulk, less powerful than the members of the preceding group, and though they may be trained to high flights are naturally captors of humbler game. The precise number of species belonging here is very doubtful, but among the many candidates for recognition are especially to be named the Lugger (*F. jugger*) of India, and the Prairie Falcon (*F. mexicanus*) of the western plains of North America.

---

[1] Among them Mr. Sharpe, who, in his recent *Catalogue of the Birds in the British Museum*, has besides rejected much of the evidence that the experience of those who have devoted years of study to the Falcons has supplied.

[2] It is not to be inferred, however, as many writers have done, that Falcons habitually prey upon birds in which disease has made any serious progress. Such birds meet their fate from the less noble *Accipitres*, or predatory animals of many kinds. But when a bird is *first* affected by any disorder, its power of taking care of itself is at once impaired, and hence in the majority of cases it may become an easy victim under circumstances which would enable a perfectly sound bird to escape from the attack even of a Falcon.

The systematist finds it hard to decide in what group he should place two somewhat large Australian species (*F. hypoleucus* and *F. subniger*), both of which are rare in collections—the latter especially; and, until more is known about them, their position must remain doubtful.

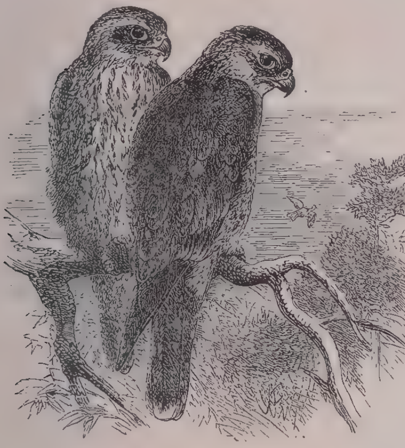

Fig. 2.—Merlin.

We have then a small but very beautiful group—the Merlins[1] (*Æsalon* of some writers, *Lithofalco* of others). The European Merlin (*F. æsalon*) is perhaps the boldest of the *Accipitres*, not hesitating to attack birds of twice its own size, and even on occasion threatening human beings. Yet it readily becomes tame, if not affectionate, when reclaimed, and its ordinary prey consists of the smaller *Passeres.* Its "pinion of glossy blue" has become almost proverbial, and a deep ruddy blush suffuses its lower parts; but these are characteristic only of the male—the female maintaining very nearly the sober brown plumage she wore when as a nestling she left her lowly cradle in the heather. Very close to this bird comes the Pigeon-Hawk (*F. columbarius*) of North America—so close, indeed, that none but an expert ornithologist can detect the difference. The Turumti of Anglo-Indians (*F. chicquera*), and its representative from Southern Africa (*F. ruficollis*), also belong to this group, but they are considerably larger than either of the former.

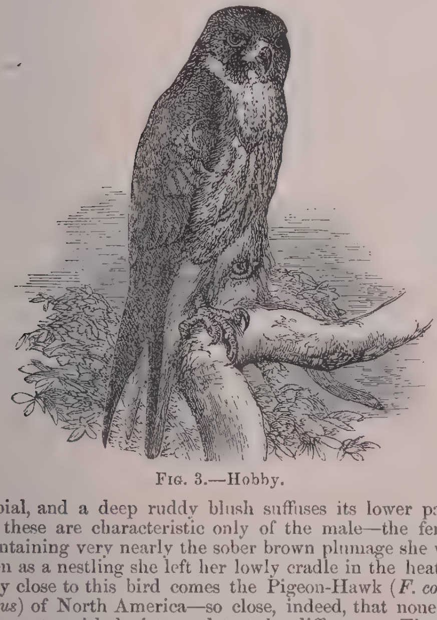

Fig. 3.—Hobby.

Lastly, we have the Hobbies (*Hypotriorchis*), comprising a greater number of forms—though how many seems to be doubtful. They are in life at once recognizable by their bold upstanding position, and at any time by their long wings. The type of this group is the English Hobby (*F. subbuteo*), a bird of great power of flight, chiefly used in the capture of insects, which form its ordinary food. It is a summer visitant to most parts of Europe, including these islands, and is most wantonly and needlessly destroyed by gamekeepers. A second European species of the group is the beautiful *F. eleonoræ*, which hardly comes further north than the countries bordering the Mediterranean, and, though in some places abundant, is an extremely local bird. The largest species of this section seems to be the Neotropical *F. femoralis*, for *F. diroleucus* though often ranked here is now supposed to belong to the group of typical Falcons. (A. N.)

FALCONE, Aniello (1600–1665), a battle-painter, was the son of a tradesman, and was born in Naples. He showed his artistic tendency at an early age, received some instruction from a relative, and then studied under Ribera (Lo Spagnoletto), of whom he ranks as the most eminent pupil. Besides battle-pictures, large and small, taken from biblical as well as secular history, he painted various religious subjects, which, however, count for little in his general reputation. He became, as a battle-painter, almost as celebrated as Borgognone (Courtois), and was named "L'Oracolo delle Battaglie." His works have animation, variety, truth to nature, and careful color. Falcone was bold, generous, used to arms, and an excellent fencer. In the insurrection of Masaniello (1647) he resolved to be bloodily avenged for the death, at the hands of two Spaniards, of a nephew and of a pupil in the school of art which he had established in Naples. He and many of his scholars, including Salvator Rosa and Carlo Coppola, formed an armed band named the Compagnia della Morte. They scoured the streets by day, exulting in slaughter; at night they were painters again, and handled the brush with impetuous zeal. Peace being restored, they had to decamp. Falcone and Rosa made off to Rome; here Borgognone noticed the works of Falcone, and became his friend, and a French gentleman induced him to go to France, where Louis XIV. became one of his patrons. Ultimately Colbert obtained permission for the painter to return to Naples, and there he died in 1665. Two of his battle-pieces are to be seen in the Louvre and in the Naples museum; he painted a portrait of Masaniello, and engraved a few plates. Among his principal scholars, besides Rosa and Coppola (whose works are sometimes ascribed to Falcone himself), were Domenico Gargiuolo named Micco Spadaro, Paolo Porpora, and Andrea di Lione.

FALCONER, Hugh (1808–1865), a distinguished palæontologist and botanist, descended from an old Scotch family, was born at Forres, 29th February, 1808. In 1826 he graduated as M. A. at Aberdeen, where he began to manifest a decided taste for the study of natural history and botany. He afterwards studied medicine in the university of Edinburgh, taking the degree of M.D. in 1829 Proceeding to India in 1830 as assistant-surgeon on th Bengal establishment of the East India Company, he made on his arrival an examination of the fossil bones from Ava in the possession of the Asiatic Society of Bengal, and a description of the collection which he published immediately gave him a recognized position among the scientists of India. In 1831 he was appointed to the army station at Meerut, in the north-western provinces, and in 1832 he succeeded his friend Dr. Royle as superintendent of the botanic garden of Saharunpoor. He was thus placed in a district particularly rich in palæontological remains, the existence of which was, however, then unknown; and he immediately set to work to investigate both its natural history and geology. In 1834 he published a description of the geological character of the neighboring Sewalik hills, in the Tertiary strata of which he discovered bones of crocodiles, tortoises, and other fossil remains; and subsequently, along with other conjoint laborers, he brought to light a sub-tropical fossil fauna of unexampled extent and richness. For these valuable discoveries he and Captain Cautley received in 1837 the Wollaston medal in duplicate from the Geological Society of London. In 1834 Falconer was appointed to inquire into the fitness of India for the growth of the tea-plant, and it was on his recommendation that it was introduced into that country. He also made large natural history collections, not only of the productions of the country round Saharunpoor, but also of the valley of Kashmir and the countries to the north of it, exploring at the same time the glacier on the southern flank of the Muztagh range, and the great glaciers of Arindoh and of the Braldoh valley. He was compelled by illness to leave India in 1842, and during his stay in England, besides reading various papers on his discoveries before several learned societies, he occupied himself with the classification and arrangement of the Indian fossils presented to the British Museum and East India House, chiefly by himself and Captain Cautley. In 1848 he was appointed superintendent of the Calcutta botanical garden, and professor of botany in the medical college; and on entering on his duties he was at once employed by the Indian Government and the Agricultural and Horticultural Society as their adviser on all matters connected with the vegetable products of India. Being compelled by the state of his health to leave India in 1855, he spent the remainder of his life chiefly in examining fossil species in England and the Continent corresponding to those which he had discovered in India. In the course of his researches he became interested in the question of the antiquity of the human race, and actually commenced a work on "Primeval Man," which, however, he was not spared to finish. He died 31st January, 1865. He was a member of many learned societies, both British and foreign. Shortly after his death a committee was formed for the promotion of a "Falconer Memorial." This took the shape of a marble bust, which was placed in the rooms of the Royal Society of London, and of a Falconer scholarship of the annual value of £100, open for competition to graduates in science or medicine of the university of Edinburgh.

---

[1] French, *Émerillon;* Icelandic, *Smirill.*

Dr. Falconer's botanical notes, with 450 colored drawings of Kashmir and Indian plants, have been deposited in the library at Kew, and his *Palæontological Memoirs and Notes*, comprising all his papers read before learned societies, have been edited, with a biographical sketch, by Charles Murchison, M.D., London, 1868.

FALCONER, **William**, our greatest naval poet,—Charles Dibdin taking rank as second,—was born in Edinburgh, February 11, 1732. His father was a wig-maker, and carried on business in one of the small shops with wooden fronts at the Netherbow Port, an antique castellated structure which remained till 1764, dividing High Street from the Canongate. The old man, who is described as a sort of humorist, was unfortunate. Of his three children two were deaf and dumb; he became bankrupt, then tried business as a grocer, and finally died in extreme poverty. William, the son, having received a scanty education, was put to sea. He served on board a Leith merchant vessel, and in his eighteenth year was fortunate enough to obtain the appointment of second mate of the "Britannia," a vessel employed in the Levant trade, and sailed from Alexandria for Venice. The "Britannia" was overtaken by a dreadful storm off Cape Colonna and was wrecked, only three of the crew being saved. Falconer was happily one of the three, and the incidents of the voyage and its disastrous termination formed the subject of his poem of *The Shipwreck*. "In all Attica," says Byron, "if we except Athens itself and Marathon, there is no scene more interesting than Cape Colonna. To the antiquary and artist, sixteen columns are an inexhaustible source of observation and design; to the philosopher the supposed scene of Plato's conversations will not be unwelcome; and the traveller will be struck with the beauty of the prospect over 'isles that crown the Ægean deep.' But for an Englishman Colonna has yet an additional interest, as the actual spot of Falconer's *Shipwreck*. Pallas and Plato are forgotten in the recollection of Falconer and Campbell—

'Here in the dead of night, by Lonna's steep,
The seaman's cry was heard along the deep.'"

After the wreck of the "Britannia" and his return to England, Falconer, in his nineteenth year, appeared as a poet. He printed at Edinburgh an elegy on Frederick, prince of Wales,—a puerile inflated performance,—and afterwards contributed short pieces to the *Gentleman's Magazine*. Some of these descriptive and lyrical effusions possess merit. The fine naval song of *The Storm* ("Cease, rude Boreas"), reputed to be by George Alexander Stevens, the dramatic writer and lecturer, has been ascribed to Falconer, but apparently on no authority. It is foreign to his usual style. Had he been the author he would assuredly have claimed it. Falconer continued in the merchant service until the spring of 1762, when he gained the patronage of Edward, duke of York, by dedicating to him his poem of *The Shipwreck*, which appeared in May of that year, "printed for the author." The duke advised him to enter the royal navy, and before the end of summer the poet-sailor was rated as a midshipman on board the "Royal George." But as this ship was paid off at the peace of 1763, and as Falconer's period of service had been too short to enable him to obtain the commission of lieutenant, he was advised to exchange the military for the civil department of the navy, and in the course of the same year he received an appointment as purser of the "Glory" frigate, a situation which he held until that vessel was laid up on ordinary at Chatham. In 1764 he published a new edition of *The Shipwreck*, corrected and enlarged, and printed, not for the author, as in the former instance, but for Andrew Millar, the publisher of Hume and Robertson, and whom Johnson called the Mæcenas of the age. About nine hundred lines were added to this new edition of the poem, including what may be termed its character-painting and elaborated description and episodes. In the same year, 1764, Falconer published a political satire, a virulent rhyming tirade against Wilkes and Churchill, entitled *The Demagogue;* and in 1769 appeared his *Universal Marine Dictionary*, an elaborate and valuable work. While engaged on this dictionary, Mr. Murray, a bookseller in Fleet Street, father of Byron's munificent publisher and correspondent, wished him to join him as a partner in business. The poet declined the offer, probably because his dictionary was then near completion, and he might reasonably anticipate from its publication some favorable naval appointment. He did receive this reward; he was appointed purser of the "Aurora" frigate, which had been commissioned to carry out to India certain supervisors or superintendents of the East India Company. Besides his nomination as purser, Falconer was promised the post of private secretary to the commissioners. Before sailing he published a third edition of his *Shipwreck*, which had again undergone "correction," but not improvement. Mr. Stanier Clarke conceived that the poet, in his agitation and joy on being appointed to the "Aurora," had neglected this edition, and left the last alterations to his friend Mallet; but Mallet had then been more than four years in his grave, and Falconer, in the "advertisement" which he prefixed to the volume, and which is dated from Somerset House, October 1, 1769, said he had been encouraged by the favorable reception the poem had met with to give it "a strict and thorough revision." The day after this announcement the poet sailed in the "Aurora" from Spithead. The vessel arrived safely at the Cape of Good Hope, and having passed a fortnight there, left on the 27th of December. She was never more heard of, having, as is supposed, foundered at sea. The captain was a stranger to the navigation, and had obstinately persisted in proceeding by the Mozambique Channel instead of stretching as usual into the Indian Ocean south of Madagascar. Every commander of a vessel, as Fielding has remarked, claims absolute dominion in his little wooden world, and in too many instances shows the dangerous consequences of absolute power.

Thus miserably perished William Falconer in the thirty-seventh year of his age. His fame rests on his poem of *The Shipwreck*, and rests securely. In that work he did not aspire to produce a great effect by a few bold touches, or the rapid and masterly grouping of appalling or horrible circumstances. He labors in detail, bringing before us the events as they arise, and conducting us with an interest constantly increasing towards the catastrophe. Such a tremendous picture of shipwreck as that which Byron has, in wild sportiveness, thrown out in *Don Juan*, immeasurably transcends the powers of Falconer, and, indeed, stands alone in its terrible sublimity; but, on the other hand, the naval poet, by the truth and reality of his descriptions, ultimately impresses the mind of the reader, if not with such vivid force, perhaps with even more enduring effect. Some of the classic invocations to the shores of Greece, and some descriptive passages, are a little tawdry, but the grand incidents of the poem are never forgotten. The personification of the ship in its last struggles is sublime as well as affecting, and the reader's anxiety and sympathy with the principal characters and the hapless crew never slumber. Nor are the technical expressions and directions a drawback to the general reader. They are explained in footnotes, and give a truth and reality to the narrative; and they do not occur in the more impassioned scenes. (R. CA.)

FALCONET, ÉTIENNE MAURICE (1716–1791), a French sculptor, was born at Paris in 1716. His parents were poor, and he was at first apprenticed to a carpenter, but some of his clay-figures, with the making of which he occupied his leisure hours, having attracted the notice of Lemoine, that sculptor made him his pupil. While diligently prosecuting his profession he found time to study Greek and Latin, and also wrote several *brochures* on art, in which many names both ancient and modern of great reputation are treated in a remarkably disparaging way. His artistic productions are characterized by the same defects as his writings, for though manifesting considerable cleverness and some power of imagination, they display in many cases a false and fantastic taste, the result most probably of an excessive striving after originality. One of his most successful statues was one of Milo of Crotona, which secured his admission to the membership of the Academy of Fine Arts. Many of his works, being placed in churches, were destroyed at the time of the French Revolution. At the invitation of the empress Catherine he went to St. Petersburg, where he executed a colossal statue of Peter the Great in bronze. On his return to Paris in 1788 he became director of the French Academy of Painting. He died 4th January, 1791.

Among his writings are *Réflexions sur la sculpture* (Par. 1768), and *Observations sur la statue de Marc Aurèle* (Par. 1771). The whole were collected under the title of *Œuvres littéraires* (6 vols., Lausanne, 1781–82; 3 vols., Paris, 1787).

FALCONRY, the art of employing falcons and hawks in the chase,—a sport the practice of which is usually termed hawking. Falconry was for many ages of the Old World's history one of the principal sports. Probably it may be considered as having been always as purely a sport as it is at the present day; for even in the rudest times man must have been possessed of means and appliances for the capture of wild birds and beasts more effectual than the agency of hawks, notwithstanding the high state of efficiency to which, as we may still see, well-trained hawks may be brought. The antiquity of falconry is very great. It seems impossible to fix the exact period of its first appearance. There appears to be little doubt that it was practised in Asia at a very remote period, for which we have the concurrent testimony of various Chinese and Japanese works, some of the latter being most quaintly and yet spiritedly illustrated. It appears to have been known in China some 2000 years B.C., and the records of a King Wen Wang, who reigned over a province of that country 689 B.C., prove that the art was at that time in very high favor. In Japan it appears to have been known at least 600 years B.C., and probably at an equally early date in India, Arabia, Persia, and Syria. Sir A. H. Layard, as we learn from his work on *Nineveh and Babylon*, considers that in a bas-relief found by him in the ruins of Khorsabad "there appeared to be a alconer bearing a hawk on his wrist," from which it would ppear to have been known there some 1700 years B.C. In all the above-mentioned countries of Asia it is practised at the present day.

Little is known of the early history of falconry in Africa, but from very ancient Egyptian carvings and drawings it seems to have been known there many ages ago. It was probably also in vogue in the countries of Morocco, Oran, Algiers, Tunis, and Egypt, at the same time as in Europe. The older writers on falconry, English and Continental, often mention Barbary and Tunisian falcons. It is still practised in Africa; the present writer has visited two hawking establishments in Egypt.

Perhaps the oldest records of falconry in Europe are supplied by the writings of Pliny, Aristotle, and Martial. Although their notices of the sport are slight and somewhat vague, yet they are quite sufficient to show clearly that it was practised in their days—between the years 384 B.C. and 40 A.D. It was probably introduced into England from the Continent about 860 A.D., and from that time down to the middle of the 17th century falconry was followed with an ardor that perhaps no sport in our country has ever called forth, not even our grand national sport of fox-hunting. Stringent laws and enactments, notably in the reigns of William the Conqueror, Edward III., Henry VIII., and Elizabeth, were passed from time to time in its interest. Falcons and hawks were allotted to degrees and orders of men according to rank and station,—for instance, to royalty the jerfalcons, to an earl the peregrine, to a yeoman the goshawk, to a priest the sparrow-hawk, and to a knave or servant the useless kestrel. The writings of Shakespeare furnish ample testimony to the high and universal estimation in which it was held in his days. About the middle of the 17th century falconry began to decline in England, to revive somewhat at the Restoration. It never, however, completely recovered its former favor, a variety of causes operating against it, such as enclosure of waste lands, agricultural improvements, and the introduction of fire-arms into the sporting field, till it fell, as a national sport, almost into oblivion. Yet it has never been even temporarily extinct, and it is still very successfully practised at the present day.

In Europe the game or "quarry" at which hawks are flown consists of grouse (confined to the British Isles), blackgame, pheasants, partridges, quails, landrails, ducks, teal, woodcocks, snipes, herons, rooks, crows, gulls, magpies, jays, blackbirds, thrushes, larks, hares, and rabbits. In former days geese, cranes, kites, ravens, and bustards were also flown at. Old German works make much mention of the use of the Iceland falcon for taking the great bustard, a flight scarcely alluded to by English writers. In Asia the list of quarry is longer, and, in addition to all the foregoing, or their Asiatic representatives, various kinds of bustards, sand grouse, storks, ibises, spoonbills, pea-fowl, jungle-fowl, kites, vultures, and gazelles are captured by trained hawks. In Mongolia and Chinese Tartary, and among the nomad tribes of Central Asia, the sport still flourishes; and though some late accounts are not satisfactory either to the falconer or the naturalist, yet they leave no doubt that a species of eagle is still trained in those regions to take large game, as antelopes and wolves. Mr. Atkinson, in his account of his travels in the country of the Amoor, makes particular mention of the sport, as does also Mr. Shaw in his work on Yarkand; and in a letter from the Yarkand embassy, under Mr. Forsyth, C. B., dated Camp near Yarkand, Nov. 27, 1873, the following passage occurs:—"Hawking appears also to be a favorite amusement, the golden eagle taking the place of the falcon or hawk. This novel sport seemed very successful." It is questionable whether the bird here spoken of is the golden eagle. In Africa gazelles are taken, and also partridges and wildfowl.

The hawks used in England at the present time are the three great northern falcons, viz., the Greenland, Iceland, and Norway falcons, the peregrine falcon, the hobby, the merlin, the goshawk, and the sparrow-hawk. In former days the saker, the lanner, and the Barbary or Tunisian falcon were also employed. (See FALCON.)

Of the foregoing the easiest to keep, most efficient in the field, and most suitable for general use at the present day are the peregrine falcon and the goshawk.

In all hawks, the female is larger and more powerful than the male.

Hawks are divided by falconers all over the world into two great classes. The first class comprises "falcons," "long-winged hawks," or "hawks of the lure," distinguished by Eastern falconers as "dark-eyed hawks." In these the wings are pointed, the second feather in the wing is the longest, and the irides are dark-brown. Merlins must, however, be excepted; and here it would seem that the Eastern distinction is the best, for though merlins are much more falcons than they are hawks, they differ from falcons in having the third feather in the wing the longest, while they are certainly "dark-eyed hawks."

The second class is that of "hawks," "short-winged hawks," or "hawks of the fist," called by Eastern falconers "yellow (or rose) eyed hawks." In these the wings are rounded, the fourth feather is the longest in the wing, and the irides are yellow, orange, or deep-orange.

The following glossary of the principal terms used in falconry may, with the accompanying woodcut, assist the reader in perusing this notice of the practice of the art. Useless or obsolete terms are omitted:—

Bate.—A hawk is said to "bate" when she flutters off from the fist, perch or block, whether from wildness, or for exercise, or in the attempt to chase.

Bewits.—Straps of leather by which the bells are fastened to a hawk's legs.

Bind.—A hawk is said to "bind" when she seizes a bird in the air and clings to it. This term is properly only applied to the seizure of large quarry, taken at a height in the air.

Block.—The conical piece of wood, of the form of an inverted flower-pot, used for hawks to sit upon; for a peregrine it should be about 10 to 12 inches high, 5 to 6 in diameter at top and 8 to 9 in diameter at base.

Brail.—A thong of soft leather used to secure, when desirable, the wing of a hawk. It has a slit to admit the pinion joint, and the ends are tied together.

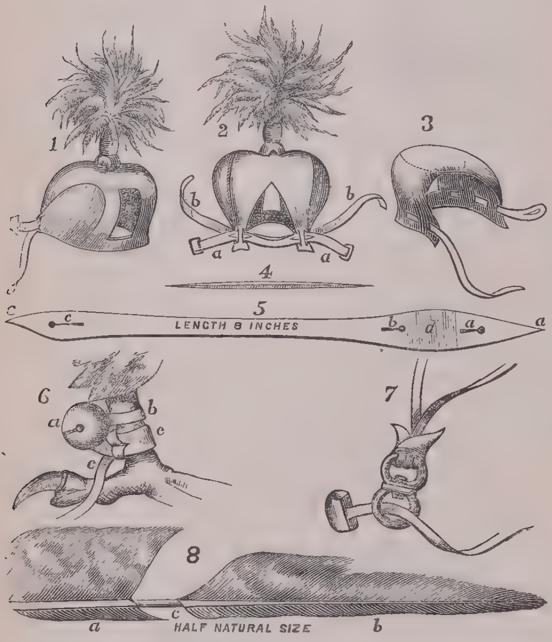
Cadge.—The wooden frame on which hawks, when numerous, are carried to the field.

Cadger.—The person who carries the cadge.

Calling off.—Luring a hawk (see *Lure*) from the hand of an assistant at a distance for training or exercise is called "calling off."

Carry.—A hawk is said to "carry" when she flies away with the quarry on the approach of the falconer.

Cast.—Two hawks which may be used for flying together are called a "cast."



Implements used in Falconry.

1. Hood; 2. Back view of hood, showing braces, *a*, *a*, *b*, *b*; by drawing the braces *b*, *b*, the hood, now open, is closed; 3. Rufter hood; 4. Imping-needle; 5. Jess; *d* is the space for the hawk's leg; the point and slit *a*, *a*, are brought round the leg and passed through slit *b*, after which the point *c* and slit *c*, and also the whole remaining length of jess, are pulled through slits *a* and *b*; *c* is the slit to which the upper ring of swivel is attached; 6. Hawk's leg with bell *a*, bewit *b*, jess *c*; 7. Jesses, swivel and leash; 8. Portion of first wing-feather of male peregrine falcon, "tiercel," half natural size in process of imping; *a*, the living hawk's feather; *b*, piece supplied from another tiercel, with the imping-needle *c* pushed half its length into it and ready to be pushed home into the living bird's feather.

Casting.—The oblong or egg-shaped ball, consisting of feathers, bones, etc., which all hawks (and insectivorous birds) throw up after the nutritious part of their food has been digested.

Cere.—The naked wax-like skin above the beak.

Check.—A hawk is said to fly at "check" when she flies at a bird other than the intended object of pursuit,—for instance, if a hawk slipped at a heron goes off at a rook, she flies at check.

Clutching.—Taking the quarry in the feet as the short-winged hawks do. Falcons occasionally "clutch."

Come to.—A hawk is said to "come to" when she begins to get tame.

Coping.—Cutting the beak or talons of a hawk is called "coping."

Crabbing.—Hawks are said to "crab" when they seize one another fighting.

Creance.—A long line or string.

Crop, to put away.—A hawk is said to "put away her crop" when the food passes out of the crop into the stomach.

Deck-feathers.—The two centre tail-feathers.

Eyas.—A hawk which has been brought up from the nest is an "eyas."

Eyry.—The nest of a hawk.

Foot.—A hawk is said to "foot" well or to be a "good footer" when she is successful in killing. Many hawks are very fine flyers without being "good footers."

Frounce.—A disease in the mouth and throat of hawks.

Get in.—To go up to a hawk when she has killed her quarry is to "get in."

Hack.—The state of partial liberty in which young hawks must always at first be kept—loose to fly about where they like, but punctually fed early in the morning and again in the day, to keep them from seeking food for themselves as long as possible.

Haggard.—A wild-caught hawk in the adult plumage.

Hood.—The cap of leather used for the purpose of blindfolding the hawk. (See woodcut.)

Hoodshy.—A hawk is said to be "hoodshy" when she is afraid of, or resists, having her hood put on.

Imping.—The process of mending broken feathers is called "imping." (See 8 in cut.)

Imping-needle.—A piece of tough soft iron wire from about 1½ to 2½ inches long, rough filed so as to be three-sided and tapering from the middle to the ends. (See 4 in cut.)

Intermewed.—A hawk moulted in confinement is said to be "intermewed."

Jesses.—Strips of light but very tough leather, some 6 to 8 inches long, which always remain on a hawk's legs—one on each leg. (See cut.)

Leash.—A strong leathern thong, some 2½ or 3 feet long, with a knot or button at one end. (See 7 in cut.)

Lure.—The instrument used for calling long-winged hawks,—a dead pigeon, or an artificial lure made of leather and feathers or wings of birds, tied to a string.

Man a hawk.—To tame a hawk and accustom her to strangers.

Mantle.—A hawk is said to "mantle" when she stretches out a leg and a wing simultaneously, a common action of hawks when at ease; also when she spreads out her wings and feathers to hide any quarry or food she may have seized from another hawk, or from man. In the last case it is a fault.

Make hawk.—A hawk is called a "make hawk" when, as a thoroughly trained and steady hawk, she is flown with young ones to teach them their work.

Mew.—A hawk is said to "mew" when she moults. The place where a hawk was kept to moult was in olden times called her "mew." Buildings where establishments of hawks were kept were called "mews"—an appellation which in many cases they have retained to this day.

Pannel.—The stomach of a hawk, corresponding with the gizzard of a fowl, is called her pannel. In it the casting is formed.

Passage.—The line herons take over a tract of country on their way to and from the heronry when procuring food in the breeding season is called a "passage."

Passage hawks.—Are hawks captured when on their passage or migration. This passage takes place twice a year, in spring and autumn.

Pelt.—The dead body of any quarry the hawk has killed.

Pitch.—The height to which a hawk, when waiting for game to be flushed, rises in the air is called her "pitch."

Plume.—A hawk is said to "plume" a bird when she pulls off the feathers.

Point.—A hawk "makes her point" when she rises in the air in a peculiar manner over the spot where quarry has saved itself from capture by dashing into a hedge, or has otherwise secreted itself.

Pull through the hood.—A hawk is said to pull through the hood when she eats with it on.

Put in.—A bird is said to "put in" when it saves itself from the hawk by dashing into covert or other place of security.

Quarry.—The bird or beast flown at.

Rake out.—A hawk is said to "rake out" when she flies, while "waiting on" (see *Wait on*), too far and wide from her master.

Red hawk.—Hawks of the first year, in the young plumage, are called "red hawks."

Ringing.—A bird is said to "ring" when it rises spirally in the air.

Rufter hood.—An easy fitting hood, not, however, convenient for hooding and unhooding—used only for hawks when first captured (see 3 in cut).

Seeling.—Closing the eyes by a fine thread drawn through the lid of each eye, the threads being then twisted together above the head,—a practice long disused in England.

Serving a hawk.—Driving out quarry which has taken refuge, or has "put in."

Take the air.—A bird is said to "take the air" when it seeks to escape by trying to rise higher than the falcon.

Tiercel.—The male of various falcons, particularly of the peregrine, is called a "tiercel;" the term is also applied to the male of the goshawk.

Trussing.—A hawk is said to "truss" a bird when she catches it in the air, and comes to the ground with it in her talons; this term is not applied to large quarry. (See *Bind.*)

Varvels.—Small rings, generally of silver, fastened to the end of the jesses—not much used now.

Wait on.—A hawk is said to "wait on" when she flies above her master waiting till game is sprung.

Weathering.—Hawks are "weathered" by being placed unhooded in the open air. This term is applied to passage hawks which are not sufficiently reclaimed to be left out by themselves unhooded on blocks,—they are "weathered" by being put out for an hour or two under the falconer's eye.

Yarak.—An Eastern term, generally applied to short-winged hawks. When a hawk is keen, and in hunting condition, she is said to be "in yarak."

The training of hawks affords much scope for judgment, experience, and skill on the part of the falconer, who must carefully observe the temper and disposition as well as the constitution of each bird; and various practices are resorted to which cannot be here described. It is through the appetite principally that hawks, like most wild animals, are tamed; but to fit them for use in the field much patience, gentleness, and care must be used. Slovenly taming necessitates starving, and low condition and weakness are the result. The aim of the falconer must be to have his hawks always keen, and the appetite when they are brought into the field should be such as would induce the bird in a state of nature to put forth its full powers to obtain its food, with, as near as possible, a corresponding condition as to flesh. The following is an outline of the process of training hawks, beginning with the management of a wild-caught peregrine falcon. When first taken, a rufter hood should be put on her head, and she must be furnished with jesses, swivel, leash, and bell. A thick glove or rather gauntlet must be worn on the left hand (Eastern falconers always carry a hawk on the right), and she must be carried about as much as possible, late into the night, every day, being constantly stroked with a bird's wing or feather, very lightly at first. At night she should be tied to a perch in a room with the window darkened, so that no light can enter in the morning. The perch should be a padded pole placed across the room, about four and a half feet from the ground, with a canvas screen underneath. She will easily be induced to feed in most cases by drawing a piece of beefsteak over her feet, brushing her legs at the time with a wing, and now and then, as she snaps, slipping a morsel into her mouth. Care must be taken to make a peculiar sound with the lips or tongue, or to use a low whistle as she is in the act of swallowing; she will very soon learn to associate this sound with feeding, and it will be found that directly she hears it, she will gripe with her talons, and bend down to feel for food. When the falconer perceives this and other signs of her "coming to," that she no longer starts at the voice or touch, and steps quietly up from the perch when the hand is placed under her feet, it will be time to change her rufter hood for the ordinary hood. This latter should be very carefully chosen,—an easy fitting one, in which the braces draw closely and yet easily and without jerking. An old one previously worn is to be recommended. The hawk should be taken into a very dark room,—one absolutely dark is best,—and the change should be made if possible in total darkness. After this she must be brought to feed with her hood off; at first she must be fed every day in a darkened room, a gleam of light being admitted. The first day, the hawk having seized the food, and begun to pull at it freely, the hood must be gently slipped off, and after she has eaten a moderate quantity, it must be replaced as slowly and gently as possible, and she should be allowed to finish her meal through the hood. Next day the hood may be twice removed, and so on; day by day the practice should be continued, and more light gradually admitted, until the hawk will feed freely in broad daylight, and suffer the hood to be taken off and replaced without opposition. Next she must be accustomed to see and feed in the presence of strangers and dogs, etc. A good plan is to carry her in the streets of a town at night, at first where the gaslight is not strong, and where persons passing by are few, unhooding and hooding her from time to time, but not letting her get frightened. Up to this time she should be fed on lean beefsteak with no castings, but as soon as she is tolerably tame and submits well to the hood, she must occasionally be fed with pigeons and other birds. This should be done not later than 3 or 4 P.M., and when she is placed on her perch for the night in the dark room, she must be unhooded and left so, of course being carefully tied up. The falconer should enter the room about 7 or 8 A.M. next day, admitting as little light as possible, or using a candle. He should first observe if she has thrown her casting; if so, he will at once take her to the fist, giving her a bite of food, and re-hood her. If her casting is not thrown it is better for him to retire, leaving the room quite dark, and come in again later. She must now be taught to know the voice,—the shout that is used to call her in the field, and to jump to the fist for food, the voice being used every time she is fed. When she comes freely to the fist she must be made acquainted with the lure. Kneeling down with the hawk on his fist, and gently unhooding her, the falconer casts out a lure, which may be either a dead pigeon or an artificial lure garnished with beefsteak tied to a string, to a distance of a couple or three feet in front of her. When she jumps down to it, she should be suffered to eat a little on it—the voice being used—the while receiving morsels from the falconer's hand; and before her meal is finished she must be taken off to the hand, being induced to forsake the lure for the hand by a tempting piece of meat. This treatment will help to check her inclination hereafter to carry her quarry. This lesson is to be continued till the falcon feeds very boldly on the lure on the ground, in the falconer's presence—till she will suffer him to walk round her while she is feeding. All this time she will have been held by the leash only, but in the next step a strong but light creance must be made fast to the leash, and an assistant holding the hawk should unhood her, as the falconer, standing at a distance of 5 to 10 yards, calls her by shouting and casting out the lure. Gradually day after day the distance is increased, till the hawk will come 30 yards or so without hesitation; then she may be trusted to fly to the lure at liberty, and by degrees from any distance, say 1000 yards. This accomplished, she should learn to stoop at the lure. Instead of allowing the hawk to seize upon it as she comes up, the falconer should snatch the lure away and let her pass by, and immediately put it out that she may readily seize it when she turns round to look for it. This should be done at first only once, and then progressively until she will stoop backwards and forwards at the lure as often as desired. Next she should be entered at her quarry. Should she be intended for rooks or herons, two or three of these birds should be procured. One should be given her from the hand, then one should be released close to her, and a third at a considerable distance. If she take these keenly, she may be flown at a wild bird. Care must, however, be taken to let her have every possible advantage in her first flights,—wind and weather, and the position of the quarry with regard to the surrounding country, must be considered.

Young hawks, on being received by the falconer before they can fly, must be put into a sheltered place, such as an outhouse or shed. The basket or hamper should be filled with straw. A hamper is best, with the lid so placed as to form a platform for the young hawks to come out upon to feed. This should be fastened to a beam or prop a few feet from the ground. The young hawks must be most plentifully fed on the best fresh food obtainable—good beefsteak and fresh-killed birds; the falconer when feeding them should use his voice as in luring. As they grow old enough they will come out, and perch about the roof of their shed, by degrees extending their flights to neighboring buildings or trees, never failing to come at feeding-time to the place where they are fed. Soon they will be continually on the wing, playing or fighting with one another, and later the falconer will observe them chasing other birds, as pigeons and rooks, which may be passing by. As soon as one fails to come for a meal, it must be at once caught with a bow net or a snare the first time it comes back, or it will be lost. It must be borne in mind that the longer hawks can be left at hack the better they are likely to be for use in the field,—those hawks being always the best which have preyed a few times for themselves before being caught. Of course there is great risk of losing hawks when they begin to prey for themselves. When a hawk is so caught, she is said to be "taken up" from hack. She will not require a rufter hood, but a good deal of the management described for the passage falcon will be necessary. She must be carefully tamed and broken to the hood in the same manner, and so taught to know the lure; but, as might be expected, very much less difficulty will be experienced. As soon as the eyas knows the lure sufficiently well to come to it sharp and straight from a distance, she must be taught to "wait on." This is effected by letting the hawk loose in an open place, such as a down. It will be found that she will circle round the falconer looking for the lure she has been accustomed to see,—perhaps mount a little in the air, and advantage must be taken of a favorable moment when the hawk is at a little height, her head being turned in towards the falconer, to let go a pigeon which she can easily catch. When the hawk has taken two or three pigeons in this way, and mounts immediately in expectation, in short, begins to wait on, she should see no more pigeons, but be tried at game as soon as possible. Young peregrines should be flown at grouse first in preference to partridges, not only because the season commences earlier, but because, grouse being the heavier birds, they are not so much tempted to "carry" as with partridges.

The training of the great northern falcons, as well as that of merlins and hobbies, is conducted much on the above principles, but the jerfalcons will seldom wait on well, and merlins will not do it at all.

The training of short-winged hawks is a simpler process. They must, like falcons, be provided with jesses, swivel, leash, and bell. In these hawks a bell is sometimes fastened to the tail. Sparrow-hawks can, however, scarcely carry a bell big enough to be of any service. The hood is seldom used for short-winged hawks,—never in the field. They must be made as tame as possible by carriage on the fist and the society of man, and taught to come to the fist freely when required,—at first to jump to it in a room, and then out of doors. When the goshawk comes freely and without hesitation from short distances, she ought to be called from long distances from the hand of an assistant, but not oftener than twice in each meal, until she will come at least 1000 yards, on each occasion being well rewarded with some food she likes very much, as a fresh-killed bird, warm. When she does this freely, and endures the presence of strangers, dogs, etc., a few bagged rabbits should be given to her, and she will be ready to take the field. Some accustom the goshawk to the use of the lure, for the purpose of taking her if she will not come to the fist in the field when she has taken stand in a tree after being baulked of her quarry, but it ought not to be necessary to use it.

Falcons or long-winged hawks are either "flown out of the hood," *i. e.*, unhooded and slipped when the quarry is in sight, or they are made to "wait on" till game is flushed. Herons and rooks are always taken by the former method. Passage hawks are generally employed for flying at these birds, though we have known some good eyases quite equal to the work. For heron-hawking a well-stocked heronry is in the first place necessary. Next an open country which can be ridden over—over which herons are in the constant habit of passing to and from their heronry on their fishing excursions, or making their "passage." A heron found at his feeding place at a brook or pond affords no sport whatever. If there be little water any peregrine falcon that will go straight at him will seize him soon after he rises. It is sometimes advisable to fly a young falcon at a heron so found, but it should not be repeated. If there be much water the heron will neither show sport nor be captured. It is quite a different affair when he is sighted winging his way at a height in the air over an open tract of country free from water. Though he has no chance whatever of competing with a falcon in straightforward flight, the heron has large concave wings, a very light body proportionately, and air-cells in his bones, and can rise with astonishing rapidity, more perpendicularly, or, in other words, in smaller rings, than the falcon can, with very little effort. As soon as he sees the approach of the falcon, which he usually does almost directly she is cast off, he makes play for the upper regions. Then the falcon commences to climb too to get above him, but in a very different style. She makes very large circles or rings, travelling at a high rate of speed, due to her strength and weight and power of flying, till she rises above the heron. Then she makes her attack by stooping with great force at the quarry, sometimes falling so far below it as the blow is evaded that she cannot spring up to the proper pitch for the next stoop, and has to make another ring to regain her lost command over the heron, which is ever rising, and so on,—the "field" meanwhile galloping down wind in the direction the flight is taking till she seizes the heron aloft, "binds" to him, and both come down together. Absurd stories have been told and pictures drawn of the heron receiving the falcon on its beak in the air. It is, however, well known to all practical falconers that the heron has no power or inclination to fight with a falcon in the air; so long as he is flying he seeks safety solely from his wings. When on the ground, however, should the falcon be deficient in skill or strength, or have been mutilated by the coping of her beak and talons, as was sometimes formerly done in Holland with a view to saving the heron's life, the heron may use his dagger-like bill with dangerous effect, though it is very rare for a falcon to be injured. It is never safe to fly the goshawk at a heron of any description. Short-winged hawks do not immediately kill their quarry as falcons do, nor do they seem to know where the life lies, and seldom shift their hold once taken even to defend themselves; and they are therefore easily stabbed by a heron. Rooks are flown in the same manner as herons, but the flight is generally inferior. Although rooks fly very well, they seek shelter in trees as soon as possible.

For game-hawking eyases are generally used, though undoubtedly passage or wild-caught hawks are to be preferred. The best game hawks we have seen have been passage hawks, but there are difficulties attending the use of them. It may perhaps be fairly said that it is easy to make all passage hawks "wait on" in grand style, but until they have got over a season or two they are very liable to be lost. Among the advantages attending the use of eyases are the following:—they are easier to obtain and to train and keep; they also moult far better and quicker than passage hawks, while if lost in the field, they will often go home by themselves, or remain about the spot where they were liberated. Experience, and, we must add, some good fortune also, are requisite to make eyases good for waiting on for game. Slight mistakes on the part of the falconer, false points from dogs, or bad luck in serving, will cause a young hawk to acquire bad habits, such as sitting down on the ground, taking stand in a tree, raking out wide, skimming the ground, or lazily flying about at no height. A good game hawk in proper flying order goes up at once to a good pitch in the air—the higher she flies the better—and follows her master from field to field, always ready for a stoop when the quarry is sprung. Hawks that have been successfully broken and judiciously worked become wonderfully clever, and soon learn to regulate their flight by the movements of their master. Eyases were not held in esteem by the old falconers, and it is evident from their writings that these hawks have been very much better understood and managed in the nineteenth century than in the Middle Ages. It is probable that the old falconers procured their passage and wild-caught hawks with such facility, having at the same time more scope for their use in days when quarry was more abundant and there was more waste land than we have now, that they did not find it necessary to trouble themselves about eyases. We here quote a few lines from one of the best of the old writers, which may be taken as giving a fair account of the estimation in which eyases were generally held, and from which it is evident that the old falconers did not understand flying hawks at hack. Simon Latham, writing in 1633, says of eyases:—

> They will be verie easily brought to familiaritie with the man not in the house only, but also abroad, hooded or unhooded, nay, many of them will be more gentle and quiet when unhooded than when hooded, for if a man doe but stirre or speake in their hearing, they will crie and bate as though they did desire to see the man. Likewise some of them being unhooded, when they see the man will cowre and crie, shewing thereby their exceeding fondness and fawning love towards him. . . . . . . These kind of hawks be all (for the most part) taken out of the nest while verie young, even in the downe, from whence they are put into a close house, whereas they be alwaies fed and familiarly brought up by the man, untill they bee able to flie, when as the summer approaching verie suddenly they are continued and trained up in the same, the weather being alwaies warm and temperate; thus they are still inured to familiaritie with the man, not knowing from whence besides to fetch their relief or sustenance. When the summer is ended they bee commonly put up into a house again, or else kept in

> some warm place, for they cannot endure the cold wind to blow upon them. . . . But leaving to speak of these kind of scratching hawks that I never did love should come too neere my fingers, and to return unto the faire conditioned haggard faulcon. . . .

The author here describes with accuracy the condition of unhacked eyases, which no modern falconer would trouble himself to keep. Many of our falconers in this century have had eyases which have killed grouse, ducks, and other quarry in a style almost equalling that of passage hawks. Rooks also have been most successfully flown, and some herons on passage have been taken by eyases. No sport is to be had at game without hawks that wait on well. Moors, downs, open country where the hedges are low and weak, are best suited to game hawking. Pointers or setters may be used to find game, or the hawk may be let go on coming to the ground where game is known to lie, and suffered, if an experienced one, to "wait on" till game is flushed. However, the best plan with most hawks, young ones especially, is to use a dog, and to let the hawk go when the dog points, and to flush the birds as soon as the hawk is at her pitch. It is not by any means necessary that the hawk should be near the birds when they rise, provided she is at a good height, and that she is watching; she will come at once with a rush out of the air at great speed, and either cut one down with the stoop, or the bird will save itself by putting in, when every exertion must be made, especially if the hawk be young and inexperienced, to "serve" her as soon as possible by driving out the bird again while she waits overhead. If this be successfully done she is nearly certain to kill it at the second flight. Perhaps falcons are best for grouse and tiercels for partridges.

Magpies afford much sport. Only tiercels should be used for hunting magpies. A field is necessary—at the very least 4 or 5 runners to beat the magpie out, and perhaps the presence of a horseman is an advantage. Of course in open flight a magpie would be almost immediately caught by a tiercel peregrine, and there would be no sport, but the magpie makes up for his want of power of wing by his cunning and shiftiness; and he is, moreover, never to be found except where he has shelter under his lee for security from a passing peregrine. Once in a hedge or tree he is perfectly safe from the wild falcon, but the case is otherwise when the falconer approaches with his trained tiercel, perhaps a cast of tiercels, waiting on in the air, with some active runners in his field. Then driven from hedge to hedge, from one kind of shelter to another, stooped at every instant when he shows himself ever so little away from cover by the watchful tiercels overhead, his egg-stealing days are brought to an end by a fatal stroke—sometimes not before the field are pretty well exhausted with running and shouting. The magpie always manœuvres towards some thick wood, from which it is the aim of the field to cut him off. At first hawks must be flown in easy country, but when they understand their work well they will kill magpies in every enclosed country,—with a smart active field a magpie may even be pushed through a small wood. Magpie hawking affords excellent exercise, not only for those who run to serve the hawks, but for the hawks also; they get a great deal of flying, and learn to hunt in company with men,—any number of people may be present. Blackbirds may be hunted with tiercels in the same way. Woodcocks afford capital sport where the country is tolerably open. It will generally be found that after a hawk has made one stoop at a woodcock, the cock will at first try to escape by taking the air, and will show a very fine flight. When beaten in the air it will try to get back to covert again, but when once a hawk has outflown a woodcock, he is pretty sure to kill it. Hawks seem to pursue woodcocks with great keenness; something in the flight of the cock tempts them to exertion. The laziest and most useless hawks—hawks that will scarcely follow a slow pigeon—will do their best at woodcock, and will very soon, if the sport is continued, be improved in their style of flying. Snipes may be killed by first-class tiercels in favorable localities. Wild ducks and teal are only to be flown at when they can be found in small pools or brooks at a distance from much water,—where the fowl can be suddenly flushed by men or dogs while the falcon is flying at her pitch overhead. For ducks, falcons should be used; tiercels will kill teal well.

The merlin is used for flying at larks, and there does not seem to be any other use to which this pretty little falcon may fairly be put. It is very active, but far from being, as some authors have stated, the swiftest of all hawks. Its flight is greatly inferior in speed and power to that of the peregrine. Perhaps its diminutive size, causing it to be soon lost to view, and a limited acquaintance with the flight of the wild peregrine falcon, have led to the mistake.

The hobby is far swifter than the merlin, but cannot be said to be efficient in the field; it may be trained to wait on beautifully, and will sometimes take larks; it is very much given to the fault of "carrying."

The three great northern falcons are not easy to procure in proper condition for training. They are very difficult to break to the hood and to manage in the field. They are flown, like the peregrine, at herons and rooks, and in former days were used for kites and hares. Their style of flight is magnificent; they are considerably swifter than the peregrine, and are most deadly "footers." They seem, however, to lack somewhat of the spirit and dash of the peregrine.

For the short-winged hawks an open country is not required; indeed they may be flown in a wood. Goshawks are flown at hares, rabbits, pheasants, partridges, and wildfowl. Only very strong females are able to take hares; rabbits are easy quarry for any female goshawk, and a little too strong for the male. A good female goshawk may kill from 10 to 15 rabbits in a day, or more. For pheasants the male is to be preferred, certainly for partridges; either sex will take ducks and teal, but the falconer must get close to them before they are flushed, or the goshawk will stand a poor chance of killing. Rabbit hawking may be practised by ferreting, and flying the hawk as the rabbits bolt, but care must be taken or the hawk will kill the ferret. Where rabbits sit out on grass or in turnip fields, a goshawk may be used with success, even in a wood when the holes are not too near. From various causes it is impossible, or nearly so, to have goshawks in England in the perfection to which they are brought in the East. In India, for instance, there is a far greater variety of quarry suited to them, and wild birds are much more approachable; moreover, there are advantages for training which we do not possess in England. Unmolested,—and scarcely noticed except perhaps by others of his calling or tastes,—the Eastern falconer carries his hawk by day and night in the crowded bazaars, till the bird becomes perfectly indifferent to men, horses, dogs, carriages, and, in short, becomes as tame as the domestic animals.

The management of sparrow-hawks is much the same as that of goshawks, but they are far more delicate than the latter. They are flown in England at blackbirds, thrushes, and other small birds; good ones will take partridges well till the birds get too wild and strong with the advancing season. In the East large numbers of quails are taken with sparrow-hawks.

It is of course important that hawks from which work in the field is expected should be kept in the highest health, and they must be carefully fed; no bad or tainted meat must on any account be given to them,—at any rate to hawks of the species now used in England. Peregrines and the great northern falcons are best kept on beefsteak, with a frequent change in the shape of fresh-killed pigeons and other birds. The smaller falcons, the merlin and the hobby, require a great number of small birds to keep them in good health for any length of time. Goshawks should be fed like peregrines, but rats and rabbits are very good as change of food for them. The sparrow-hawk, like the small falcons, requires small birds. All hawks require castings frequently. It is true that hawks will exist, and often appear to thrive, on good food without castings, but the seeds of probable injury to their health are being sown the whole time they are so kept. If there is difficulty in procuring birds, and it is more convenient to feed the hawks on beefsteak, they should frequently get the wings and heads and necks of game and poultry. In addition to the castings which they swallow, tearing these is good exercise for them, and biting the bones prevents the beaks from overgrowing. Most hawks, peregrines especially, require the bath. The end of a cask, sawn off to give a depth of about 6 inches, makes a very good bath. Peregrines which are used for waiting on require a bath at least twice a week. If this be neglected, they will not wait long before going off in search of water to bathe, however hungry they may be.

The most agreeable and the best way, where practicable, of keeping hawks is to have them on blocks on the lawn. Each hawk's block should stand in a circular bed of sand —about 8 feet in diameter; this will be found very convenient for keeping them clean. Goshawks are generally placed on low perches, which ought not to be more than 8 or 9 inches high at the highest part of the arc. It will be several months before passage or wild-caught falcons can be kept out of doors; they must be fastened to a perch in a darkened room, hooded, but by degrees as they get thoroughly tame may be brought to sit on the lawn. In England (especially in the south) peregrines, the northern falcons, and goshawks may be kept out of doors all day and night in a sheltered situation. In very wild boisterous weather, or in snow or sharp frost, it will be advisable to move them to the shelter of a shed, the floor of which should be laid with sand to a depth of 3 or 4 inches. Merlins and hobbies are too tender to be kept much out of doors. An eastern aspect is to be preferred,—all birds enjoy the morning sun, and it is very beneficial to them. The more hawks confined to blocks out of doors see of persons, dogs, horses, etc., moving about the better, but of course only when there is no danger of their being frightened or molested, or of food being given to them by strangers. Those who have only seen wretched ill-fed hawks in cages as in zoological gardens or menageries, pining for exercise, with battered plumage, torn shoulders, and bleeding ceres from dashing against their prison bars, and overgrown beaks from never getting bones to break, can have little idea of the beautiful and striking-looking birds to be seen pluming their feathers and stretching their wings at their ease at their blocks on the falconer's lawn, watching with their large bright keen eyes everything that moves in the sky, and everywhere else within the limits of their view. Contrary to the prevailing notion, hawks show a good deal of attachment when they have been properly handled. It is true that by hunger they are in a great measure tamed and controlled, and the same may be said of all undomesticated and many domesticated animals. And instinct prompts all wild creatures when away from man's control to return to their former shyness, but hawks certainly retain their tameness for a long time, and their memory is remarkably retentive. Wild-caught hawks have been re-taken, either by their coming to the lure or upon quarry, from 2 to 7 days after they had been lost, and eyases after 3 weeks. As one instance of retentiveness of memory displayed by hawks we may mention the case of a wild-caught falcon which was re-captured after being at liberty more than 3 years, still bearing the jesses which were cut short close to the leg at the time she was released; in five days she was flying at the lure again at liberty, and was found to retain the peculiar ways and habits she was observed to have in her former existence as a trained hawk. It is useless to bring a hawk into the field unless she has a keen appetite; if she has not, she will neither hunt effectually nor follow her master. Even wild-caught falcons, however, may sometimes be seen so attached to their owner that, when sitting on their blocks on a lawn with food in their crops, they will on his coming out of the house bate hard to get to him, till he either go up to them and allow them to jump up to his hand or withdraw from their sight. Goshawks are also known to evince attachment to their owner. Another prevailing error regarding hawks is that they are supposed to be lazy birds, requiring the stimulus of hunger to stir them to action. The reverse is the truth; they are birds of very active habits, and exceedingly restless, and the notion of their being lazy has been propagated by those who have seen little or nothing of hawks in their wild state. The wild falcon requires an immense deal of exercise, and to be in wind, to exert the speed and power of flight necessary to capture her prey when hungry; and to this end instinct prompts her to spend hours daily on the wing, soaring and playing about in the air in all weathers, often chasing birds merely for play or exercise. Sometimes she takes a siesta when much gorged, but unless she fills her crop late in the evening she is soon moving again—before half her crop is put over. Goshawks and sparrow-hawks too, habitually soar in the air at about 9 or 10 A.M., and remain aloft a considerable time, but these birds are not of such active habits as the falcons. The frequent bating of thoroughly tame hawks from their blocks, even when not hungry or frightened, proves their restlessness and impatience of repose. So does the wretched condition of the caged falcon (before alluded to), while the really lazy buzzards and kites, which do not in a wild state depend on activity or power of wing for their sustenance, maintain themselves in confinement, if properly fed, for years in good case and plumage. Such being the habits of the falcon in a state of nature, the falconer should endeavor to give the hawks under his care as much flying as possible, and he should avoid the very common mistake of keeping too many hawks. In this case a favored few are sure to get all the work, and the others, possibly equally good if they had fair play, are spoiled for want of exercise.

The larger hawks may be kept in health and working order for several years—15 or 20—barring accidents. The writer has known peregrines, shaheens, and goshawks to reach ages between 15 and 20 years. Goshawks, however, never fly well after 4 or 5 seasons, when they will no longer take difficult quarry; they may be used at rabbits as long as they live. Shaheens may be seen in the East at an advanced age, killing wild-fowl beautifully. The shaheen is a falcon of the peregrine type, which does not travel, like the peregrine, all over the world. It appears that the jerfalcons also may be worked to a good age. Old Simon Latham tells us of these birds,—"I myself have known one of them an excellent Hearnor, and to continue her goodnesse very near twentie yeeres, or full out that time."

It is hardly likely that falconry will ever recover such a position as to be reckoned once more among the national sports of England. Yet in these days of breech-loading and battue shooting, when even a well-broken retriever is a rarity, from want of time to see him work or to give him fair play, there are still some sportsmen who are, to quote the words of the authors of our best modern book on falconry, in the dedication of their work, "those who love sport for its own sake, and in the pursuit of it are willing to tread in the footsteps of their forefathers."

The work just quoted is *Falconry in the British Isles*, by Salvin and Brodrick. A work to which we are very largely indebted for information regarding the past history of falconry and its practice in foreign countries is Schlegel's *Traité de Fauconnerie*. This magnificent book, in the words of a very able writer in the *Quarterly Review* for July, 1875, "is a worthy monument of the noble art it describes; the extent and minuteness of the learned author's antiquarian resources are only equalled by his practical knowledge of the details of modern usage, and the result is such as may be expected from such a combination." It contains a very large list of works on falconry in languages of all the principal countries of the Old World. Other modern works are *Practical Falconry*, by the Rev. G. E. Freeman, an excellent little book; *Falconry, its Claims, History, and Practice*, by Freeman and Salvin; *Observations on Hawking*, by Sir J. S. Sebright, Bart.; and a pamphlet entitled *Notes on the Falconidæ used in India in Falconry*, by Lieutenant-Colonel Delmé Radcliffe. Perhaps the most useful of the old works are *The Booke of Faulconrie or Hawking*, by George Turberville, 1575, and *The Faulcon's Lure and Cure*, by Simon Latham, 1633. (E. D. R.)

FALERII, an ancient and powerful city of Etruria, the capital of the Falisci, who occupied the region between Soracte and Monte Cimino. The affinity of the Falisci with the Etrurians is both asserted and denied; in historic times Falerii at least appears as a city of Etrurian sympathies, and it probably belonged to the Etrurian League. It supported the people of Veii against the Romans, and used its utmost efforts to rouse the other Etrurians against the common foe. After the reduction of Veii the Faliscans saw themselves exposed to the fury of the Roman arms, and after a siege from Camillus they were obliged to surrender their city. The episode of the traitor schoolmaster and the generosity of the Roman commander needs only be mentioned to be generally remembered. From this time Falerii continued sometimes at peace, sometimes at war with Rome, till on the conclusion of the first Punic war it rose in open rebellion; after a short resistance it was taken and destroyed, and its inhabitants were forced to select a site for a new city in a less inaccessible and defensible position. The Falerii thus founded was enrolled in the Horatian tribe, and under the triumvirs received a military colony. The old city continued, probably from its religious associations, to retain a small population, and this in all likelihood explains the fact that Strabo speaks of two towns, one Falerii and the other Faliscum. Ovid in his *Amores* relates how he ascended by a toilsome path to the temple of the Faliscan Juno, a goddess, who, according to inscriptions, bore the title of Quuris (or "of the spear"), and, if we may trust the tradition, had young girls immolated on her altar. In the Middle Ages the inhabitants of the Roman town, invited by the impregnable position of the earlier site, returned and built the town now known as Civita Castellana. The ruins they left behind them are now occupied by the small hamlet of Santa Maria di Falleri. They consist mainly of the city walls, which stand from 35 to 55 feet high, and are of excellent architecture and strengthened by square towers. Within the ancient area are the remains of a convent in the Lombard style, and we learn from a bull of Benedict IX. that the town continued a separate see from Castellana till 1033.

Excavations made at Santa Maria di Falleri by Angelo Jannoni Sebastiani are reported in the *Annales dell Inst. di Cor. Arch. di Roma*, 1860, and the *Bullettino*, 1864; see also Noel Desverger's *L'Étrurie*, 1862–64.

FALERNUS AGER, the name of a district in the northern part of Campania. The term has sometimes a wide and sometimes a restricted signification, being used with reference to the whole of the fertile plain between the Massican (now Mandragone) hills and the river Vulturnus, but more commonly as denoting that portion of the plain lying at the foot of the Massican hills between the rivers Vulturnus and Savo, and celebrated for its wines. In the time of Horace these were reputed to be the best of all Italy, but in the time of Pliny their reputation had begun to decline, and they were supplanted in general estimation by those produced in the adjoining Ager Statanus. Before it passed into the hands of the Romans, in 340 B.C., the whole district formed part of the Capuan territory. In 217 B.C. it was desolated by the Carthaginian general Maharbal.

FALIERO, Marino (1274–1355), doge of Venice, was born in 1274. In 1346 he commanded the Venetian forces at the siege of Zara, where, being attacked by Louis the Great of Hungary with a force of 80,000 men, he totally defeated them, inflicting a loss of 8000, and compelling him to abandon all further attempts to raise the siege, which was concluded shortly afterwards by the surrender of the defenders at discretion. As commander of the Venetian fleet he also gained several victories and captured Capo d'Istria. He was elected doge 11th September, 1354. His reign was short, and it had both a disastrous commencement and a tragic close. Very soon after his election the Venetian fleet was captured by the Genoese, and hardly had he concluded a four months' truce with Genoa, when a very trivial incident occurred which resulted in his arrest and execution. It would appear that, though an able general and prudent statesman, Faliero possessed a temper so choleric that when he was provoked reason for a time almost forsook him. On the occasion of the usual court feast on Shrove Thursday, a young nobleman named Michele Steno, perhaps excited by wine, took some liberties with one of the maids of honor, and the doge on that account caused him to be ignominiously expelled from the hall. Provoked at such a public affront Steno went to the hall of audience and wrote on the doge's chair the following words—*Marini Falieri dalla bella moglie, altri la gode ed egli la mantiene* (Marino Faliero, the husband of the beautiful wife; others kiss her, he keeps her). The author of the insult was soon discovered and arrested, but the council sentencing him only to two months' imprisonment, the doge resolved to have adequate revenge, and with this view formed a conspiracy to seize all the nobles and leading citizens, and to make himself despot of Venice. The plot being, however, discovered a short time before the day fixed on, the doge and principal conspirators were arrested, and were executed on the 17th April, 1355.

The reign of Faliero has formed the subject of tragedies by Lord Byron, by Delavigne, and by Albert Lindner; and Hoffman has employed it to furnish materials for a romance. It also forms the subject of the libretto of one of Donizetti's operas. Byron has added to his tragedy a good many notes on the character of Faliero, and on the incidents of his reign, together with an English translation—made by F. Cohen—of the old *Chronicle of Marino Faliero*. The circumstances of Faliero's plot are related in one of the letters of Petrarch, who was his contemporary and friend.

FALK, Johann Daniel (1768–1826), a German author and philanthropist, was born at Dantzic, 20th October, 1768. His parents, who were in poor circumstances, gave him only a scanty education, and strongly opposed his desire to enter one of the learned professions; but notwithstanding their discouragement he managed not only to make himself acquainted with the best German writers, but also to learn French and English. After attending for some time the gymnasium of his native town, he entered the university of Halle with the view of studying theology; but preferring, on second thoughts, a non-professional life, he gave up his theological studies and went to live at Weimar. There he published a volume of satires which procured him the notice and friendship of Wieland, and admission into the literary circles of the city. On the invasion of Germany by the French, Falk joined the army, and so distinguished himself at the battle of Jena that the duke of Weimar created him a counsellor of legation. In 1813 he succeeded in establishing a society for friends in necessity, and about the same time he founded an institute for the care and education of neglected and orphan children, which in 1829 was changed into a free public school. The first literary efforts of Falk took the form chiefly of satirical poetry, and gave promise of greater future excellence than was ever completely fulfilled, for as his later pieces were directed more against individuals than the general vices and defects of society, they gradually degenerated in quality. In 1804 he published a comedy entitled *Amphitryon*, which met with some success, and a tragedy entitled *Prometheus*, which, although in many places deficient in rhythm and melody, and in form more philosophical than dramatic, yet contains many fine thoughts expressed in language truly poetical. From 1797 to 1803 he published a kind of satirical almanac entitled *Taschenbuch für Freunde des Scherzes und der Satire*. In this publication he wrote a description of the hospitals of Berlin under the satirical title of *Denkwürdigkeiten der Berliner Charité auf das Jahr 1797*, which led to the appointment of a committee to inquire into their management, and finally to their reform. In 1806 Falk founded a critical journal under the title of *Elysium und Tartarus*. He also contributed largely to contemporary journals. He enjoyed the acquaintance and intimate friendship of Goethe, and his account of their intercourse was published after the death of both under the title *Goethe aus näherm persönlichen Umgange dargestellt*, Leipsic, 1832. Falk died 14th February, 1826.

See *Johannes Falks Erinnerungsblätter aus Briefen und Tagebüchern, gesammelt von dessen Tochter Rosalie Falk*, Weimar, 1868.

FALKE, Johann Friedrich Gottlieb (1823–1876), a German historian, was born at Ratzeburg, 20th April, 1823. He entered the university of Erlangen in 1843, and soon thereafter began to devote his attention to the history of the German language and literature. In 1848 he went in the capacity of tutor to Munich, where he remained five years, and diligently availed himself of the use of the Government library for the purpose of prosecuting his historical studies. In 1855 he was appointed secretary of the German museum at Nuremberg, and in 1859 keeper of the manuscripts. With the aid of the manuscript collections in the museum he now turned his attention chiefly to political history, and, along with his brother Jacob, who is still (1878) living, and Johann Müller, established an historical journal under the name of *Zeitschrift für deutsche Culturgeschichte* (4 vols., 1855–59). To this journal he contributed a history of German taxation and commerce. On the latter subject he published separately *Geschichte des deutschen Handels* (2 vols., Leipsic, 1859), and *Die Hansa als deutsche See- und Handelsmacht* (Berlin, 1862). In 1862 he was appointed secretary of the state archives at Dresden, and a little later keeper. He there began the study of Saxon history, still devoting his attention chiefly to the history of commerce and economy. In 1868 he published, at Leipsic, *Die Geschichte des Kurfürsten August von Sachsen in volkswirthschaftlicher Beziehung*, and in 1869 *Geschichte des deutschen Zollwesens*. He died at Dresden, 1st March, 1876.

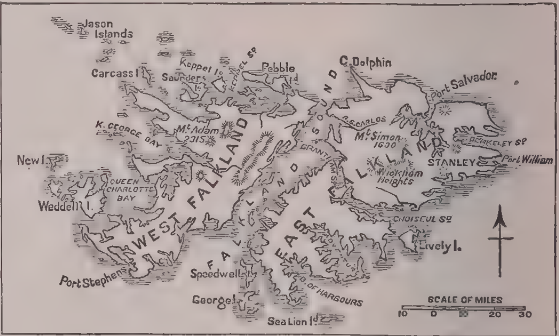
FALKIRK, a municipal and parliamentary burgh and market-town of Scotland, in the county of Stirling, 25½ miles W. by N. from Edinburgh by rail, is situated on a declivity which overlooks the expanse of fertile country called the Carse of Falkirk. The town consists of one wide street, with a number of narrow streets and lanes branching off from or running parallel to it. The houses are generally lofty and well built. The parish church, erected in 1811, has a fine steeple 130 feet high. There are also places of worship for the Free Church, United Presbyterians, Independents, and Roman Catholics. Continuous lines of houses connect Falkirk with the villages of Grahamston and Bainsford, and extend thence to Carron, which lies about two miles N. of the town, and is celebrated for its iron-works. Though Falkirk is not itself a manufacturing town, yet in the neighborhood there are extensive works of various kinds. In addition to the Carron iron-works there is the Falkirk foundry at Bainsford, and several large collieries, distilleries, flour-mills, etc. The three trysts or cattle fairs held at Falkirk annually, on the 2d Tuesday and Wednesday of August, the 2d Monday and Tuesday of September, and the 2d Monday, Tuesday, and Wednesday of October, are the largest in Scotland,—the last being the largest of the three. Population of parliamentary burgh in 1871, 9547; of burgh and suburbs, 11,312.

Falkirk is a town of considerable antiquity, and appears to have been a place of some note in the early part of the 11th century. Its original name was Eglishbreckk, which signifies the "speckled church," in allusion, it is supposed, to the color of the stones, and translated by Buchanan *varium sacellum*. In the valley between Falkirk and the Carron a battle was fought on the 22d July, 1298, between the Scotch under Wallace and the English under Edward I., in which the former were defeated, and two of their chieftains, Sir John Graham and Sir John Stewart, slain. Their graves are still pointed out in the churchyard: that of Graham has a monument with an inscription which has been several times renewed. On a moor a little to the S. W. of the town a battle was fought on 17th January, 1746, between the royal forces and those of the Pretender, in which the rebels were victorious. On this occasion fell Sir Robert Monro of Foulis, and his brother Dr. Monro, whose monument is to be seen in the churchyard. In the vicinity traces of the Roman wall are still visible. Falkirk was made a burgh of barony in 1600, and in 1646 a burgh of regality. In 1715, by the forfeiture of the earl of Linlithgow, its superiority was vested in the crown, but it did not become a municipal burgh till the passing of the Reform Act of 1832, when it also obtained the privilege, in conjunction with Airdrie, Lanark, Hamilton, and Linlithgow, of returning a member to parliament.

FALKLAND, a royal burgh of Scotland, county of Fife, is situated at the N. foot of the East Lomond Hill, 22 miles N.N.W. of Edinburgh. It consists of a single street with some cross lanes, the houses being in many cases thatched and of an antique and primitive appearance. The inhabitants are engaged chiefly in weaving and flax-spinning. Falkland is noted for its royal palace, originally a stronghold of the Macduffs, earls of Fife, but forfeited to the crown in 1424. The palace was greatly enlarged and improved by James V., who died there in 1542, and was also the favorite residence of James VI., on account of the fine park and the abundance of deer. The east side of the building was accidentally burnt in the reign of Charles II., and the park was ruined during the time of Cromwell, when the fine oaks were cut down in order to build a fort at Perth. In one of the dungeons David, duke of Rothesay, eldest son of Robert III., was starved to death by the duke of Albany (the king's brother) and the earl of Douglas in 1402. In 1715 the famous Rob Roy garrisoned the palace, and laid the burgh and vicinity under contribution. The palace till recently was allowed to fall into decay, but what remained of it has been renovated, and is now occupied as a dwelling house. The western front has two round towers, similar to those at Holyrood, and the southward range of buildings is ornamented with niches and statues, which impart to it a close resemblance to the Perpendicular style of the semi-ecclesiastical architecture of England. Falkland was constituted a royal burgh by James II. in 1458, and its charter was renewed by James VI. in 1595. Population of the burgh, 1144; of the burgh and suburbs, 1283.

FALKLAND, VISCOUNT. See CARY, LUCIUS.

FALKLAND ISLANDS (French, *Malouines*; Spanish, *Malvinas*), a group of islands in the South Atlantic, belonging to Britain, and lying about 250 miles E. of the nearest point in the mainland of South America, between the parallels of 51° and 52° 45′ S. and the meridians of 57° 20′ and 61° 46′ W. The islands are about 200 in number, but only two are of considerable size; the largest of these, East Falkland, is 95 miles in extreme length, with an average width of 40 miles, and the smaller, West Falkland, is 80 miles long, and about 25 miles wide. The area of East Falkland is about 3000 square miles, and that of West Falkland 2000. Most of the others are mere islets, the largest 16 miles long by 8 miles wide. The two principal islands are separated by Falkland Sound, a narrow strait from 18 to 2½ miles in width, running nearly due north and south (magnetic). The coast-line of both islands is deeply indented, and many of the bays and inlets form secure and well-protected harbors. East Falkland is almost bisected by two deep fiords, Choiseul and Brenton Sounds, which leave the northern and southern portions connected only by an isthmus a mile and a half wide. The northern portion is hilly, and is crossed by a rugged range, the Wickham Heights, running east and west, and rising in some places to a height of nearly 2000 feet. The remainder of the island consists chiefly of low undulating ground, a mixture of pasture and morass, with many shallow freshwater tarns, and small streams running in all the valleys. The general appearance of the country is tame and uninteresting, not unlike one of the Outer Hebrides. The general coloring is dark brownish-green, relieved along the strike of the hills by veins of white quartzite denuded by the wearing away of softer rocks on both sides, and left projecting on the mountain slopes like dilapidated stone dykes. Two fine inlets, Berkeley Sound and Port William, run far into the land at the north-eastern extremity of the island. Port Louis, until lately the seat of government, is at the head of Berkeley Sound, but the anchorage there having been found rather too exposed, about the year 1844 a town was laid out, and the necessary public buildings were erected on Stanley Harbor, an admirably sheltered recess within Port William. Above Stanley Harbor the land slopes up for a hundred feet or so to a low ridge, beyond which what is called there the "camp" (*campo*) extends nearly level for many miles. The little town of Stanley is built along the shore of the harbor, and stretches a short way up the slope. It has a population of 600 or 700 inhabitants. The houses are mostly square, whitewashed, and gray-slated, much like those of one of the newer small towns in the West Highlands of Scotland. The Government house puts one in mind of a Shetland or Orkney manse, stone-built, slated, and gray, without the least shelter. The Government barrack, occupied by an officer and a company of marines, is a rather imposing structure in the middle of the town, and there is a neat little Episcopal church. Many of the houses belonging to the agents of the Falkland Islands Company, and to the representatives of several private firms, have very pretty greenhouses attached to them, the gay groups of fuchsias and pelargoniums of all the best home varieties contrasting pleasantly with the barrenness without.



Map of the Falkland Islands.

In 1845, Mr. S. Lafone, a wealthy cattle and hide merchant on the river Plate, obtained from Government a grant of the southern portion of the island, a peninsula 600,000 acres in extent, and possession of all the wild cattle on the island for a period of six years, for a payment of £10,000 down, and £20,000 in ten years from January 1, 1852. In 1851, Mr. Lafone's interest in Lafonea, as the peninsula has since been called, was purchased for £30,000 by a company chartered in London for the purpose of turning the islands to more account.

The headquarters of the Falkland Island Company are now at Stanley, where their colonial manager resides, while their grazing and boiling-down operations are carried out in different parts of the islands. The development of the undertaking has necessitated the establishment of stores and workshops at Stanley, and now ships can be repaired and provided in every way, much better and more cheaply there than at any of the South American ports,—a matter of much importance, seeing that a greater amount of injury is done annually to shipping passing near Cape Horn by severe weather than in any other locality in the world. The average number of vessels entering Stanley Harbor in the year is about 50, with an aggregate tonnage of 20,000 tons. Of this number about one-fourth arrive in distress and are repaired at Stanley. Next to Stanley the most important place on East Falkland is Port Darwin, on Choiseul Sound,—a station of the Falkland Island Company, a village chiefly of Scottish shepherds, with a little iron church with schoolhouse attached, and a Presbyterian clergyman and a competent schoolmaster. West Falkland is more hilly near the east island. The principal mountain range, the Hornby Hills, runs north and south parallel with Falkland Sound. Mount Maria, at the back of Port Howard, is 2270 feet high. In 1867 there were no settlers on the west island, and Government issued a proclamation offering leases of grazing-stations on very moderate terms. In 1868 all the available land was occupied, producing an annual revenue of about £1350. Some good houses have lately been built at Port Stephens, Mr. Dean's station on West Falkland.

The Falkland Islands were first seen by Davis in the year 1592, and Sir Richard Hawkins sailed along their north shore in 1594. In 1598 Sebald de Wert, a Dutchman, visited them, and called them the Sebald Islands, a name which they still bear on some of the Dutch maps. Captain Strong sailed through between the two principal islands in 1690, and called the passage Falkland Sound, and from this the group afterwards took its English name. In 1763 the islands were taken possession of by the French, who established a colony at Port Louis on Berkeley Sound; they were, however, expelled by the Spaniards in 1767 or 1768. In 1761 Commodore Byron took possession on the part of England on the ground of prior discovery, and his doing so was nearly the cause of a war between England and Spain, both countries having armed fleets to contest the barren sovereignty. In 1771, however, Spain yielded the islands to Great Britain by convention. As they had not been actually colonized by England, the republic of Buenos Ayres claimed the group in 1820, and formed a settlement at Port Louis which promised to be fairly successful, but owing to some misunderstanding with the Americans it was destroyed by the latter in 1831. After all these vicissitudes the British flag was once more hoisted at Port Louis in 1833, and since that time the Falkland Islands have been a regular British colony under a governor, and the seat of a colonial bishopric. The population of the Falkland Islands is at present about 1250, by far the greater number being English and Scottish, with a few Buenos-Ayrean Gauchos. The number of children on the school-roll in 1876 was 127. The exports now consist almost entirely of wool and tallow, with a few hides. The rearing of cattle is rapidly giving place to sheep-farming, which is found to pay better. There are now upwards of 200,000 sheep on the islands, and they yield heavy fleeces of wool of fine quality. In 1876 the value of exports amounted to £37,121, of which wool sales account for £25,453. A process adopted a few years ago by the Falkland Island Company of boiling down the carcasses of sheep for tallow is likely to prove successful, and to add another valuable export. The trade in sealskins, which was at one time of great value, is now almost at an end, and there is also a great falling off in the export of oil, the whales and seals which were at one time very numerous, particularly about West Falkland, having almost entirely left the coasts.

The Falkland Islands correspond very nearly in latitude in the southern hemisphere with Middlesex in the northern, but the conditions of climate are singularly different. The temperature is very equable, the average of the two midsummer months being about 47° Fahr., and that of the two midwinter months 37° Fahr. The sky is almost constantly overcast, and rain falls, mostly in a drizzle and in frequent showers, on about 250 days in the year. The rainfall is not great, only about 20 inches, but the mean humidity for the year is 80, saturation being 100. Owing to the absence of sunshine and summer heat, and the constant fog and rain, wheat will not ripen, barley and oats can scarcely be said to do so, and the common English vegetables will not produce seed in the gardens. Still the inhabitants seem to get accustomed to their moist, chilly surroundings, and the colony is remarkably healthy.

The Falkland Islands form essentially a part of Patagonia, with which they are connected by an elevated submarine plateau, and their flora is much the same as that of Antarctic South America. The trees which form dense forest and scrub in southern Patagonia and in Fuegia are absent, and one of the largest plants on the islands is a gigantic woolly ragweed (*Senecio candicans*) which attains in some places a height of three to four feet. A half-shrubby veronica (*V. decussata*) is found locally on the west island. The greater part of the "camp" is formed of peat, which in some places is of great age and depth, and at the bottom of the bed very dense and bituminous. The peat is different in its character from that of the north of Europe: cellular plants enter but little into its composition, and it is formed almost entirely of the roots and stems of *Empetrum rubrum*, a variety of the common crowberry of the Scottish hills with red berries, called by the Falklanders the "diddle-dee" berry; of *Myrtus nummularia*, a little creeping myrtle whose leaves are used by the shepherds as a substitute for tea; of *Caltha appendiculata*, a dwarf species of marsh-marigold; and of some sedges and sedge-like plants, such as *Astelia pumila*, *Gaimardia australis*, and *Bostkovia grandiflora*. There is an intention of establishing a work in Stanley for converting the peat into patent compressed fuel.

Two vegetable productions of the Falklands, the "balsam bog" and the "tussock grass," have been objects of curiosity and interest ever since the first accounts of the islands reached us. In many places the low grounds look at a little distance as if they were scattered over with large gray boulders, three or four to six or eight feet across. To heighten the illusion many of these blocks are covered with lichens, and bands of grass grow in soil collected in crevices, just as they would in little rifts in rocks. These boulder-like masses are single plants of *Bolax glebaria*, an umbelliferous plant. The lumps of balsam-bog are quite hard and nearly smooth, and only when looked at closely are they seen to be covered with small hexagonal markings like the calices of a weathered piece of coral. These are the circlets of leaves and the leaf-buds terminating a multitude of stems which have gone on growing with extreme slowness and branching dichotomously for an unknown length of time, possibly for centuries, ever since the plant started as a single shoot from a seed. The growth is so slow, and the condensation from constant branching is so great, that the block becomes as hard as the boulder which it so much resembles, and it is difficult to cut a shaving from the surface with a sharp knife. Under the unfrequent condition of a warm day with the sun shining, a pleasant aromatic odor may be perceived where the plants abound, and a pale yellow astringent gum exudes from the surface, which is used by the shepherds as a vulnerary. The "tussock-grass," *Dactylis cæspitosa*, is a wonderful and most valuable natural production, which, owing to the introduction of stock into the islands, will probably ere long become extinct. It is a reed-like grass, which grows in dense tufts from six to ten feet high from stool-like root-crowns. The leaves and stems are most excellent fodder, and are extremely attractive to cattle, but the lower parts of the stems and the crowns of the roots have a sweet nutty flavor which makes them irresistible, and cattle and pigs, and all creatures herbivorous and omnivorous, crop the tussocks to the ground, when the rain getting into the crowns rots the roots. The work of extermination has proceeded rapidly, and now the tussock grass is confined to patches in a narrow border round the shore and to some of the outlying islands. The land fauna of the Falklands is very scanty. A large wolf-like fox, which seems to be indigenous, was common some years ago, but is now nearly exterminated. Some herds of cattle and horses run wild; but these were of course introduced, as were also the wild hogs, the numerous rabbits, and the much less numerous hares. Land-birds are few in number, and are mostly strays from Fuegia. Sea-birds are very abundant, and, probably from the islands having been comparatively lately peopled, they are singularly tame. Several species of wild geese, some of them very good eating, fly about in large flocks, and are so fearless that the boys bring them down at will by entangling their wings with a form of the "bolas" made with a pair of the knuckle-bones of an ox.

The Falkland Islands consist entirely, so far as we know at present, of the older palæozoic rocks, Lower Devonian or Upper Silurian, slightly metamorphosed and a good deal crumpled and distorted, in the low grounds clay slate and soft sandstone, and on the ridges hardened sandstone passing into the conspicuous white quartzites. There do not seem to be any minerals of value, and the rocks are not such as to indicate any probability of their discovery. Galena is found in small quantity, and in some places it contains a large percentage of silver. The dark bituminous layers of clay slate, which occur intercalated among the quartzites, have led, here as elsewhere, to the hope of coming upon a seam of coal, but it is entirely contrary to experience that coal of any value should be found in rocks of that age.

Most of the valleys in the Falklands are occupied by pale glistening masses which at a little distance have very much the look of some of the smaller Swiss glaciers. Examined a little more closely these are found to be vast accumulations of blocks of quartzite, irregular in form, but having a tendency to a rude diamond shape, from two to eight or ten or twenty feet in length, and half as much in width, and of a thickness corresponding with that of the quartzite ridges on the hills above. The blocks are angular, like the fragments in a breccia, and rest irregularly one upon the other, supported in all positions by the angles and edges of those beneath. The whole mass looks as if it were, and no doubt it is, slowly sliding down the valley to the sea. These "stone rivers" are looked upon with great wonder by the shifting population of the Falklands, and they are shown to visitors with many strange speculations as to their mode of formation. Their origin is not far to seek. The hard beds of quartzite are denuded by the disintegration of the softer layers. Their support being removed they break away in the direction of natural joints, and the fragments fall down the slope upon the vegetable soil. This soil is spongy, and, undergoing alternate contraction and expansion from being alternately comparatively dry and saturated with moisture, allows the heavy blocks to slip down by their own weight into the valley, where they become piled up, the valley stream afterwards removing the soil from among and over them. They certainly present a very striking phenomenon.

FALLMERAYER, Jakob Philipp (1791–1861), a German traveller and historical investigator, best known for his opinions in regard to the ethnology of the modern Greeks, was born, the son of a poor peasant, at Tschötsch, near Brixen in Tyrol, 10th December, 1791. In 1809 he absconded from the cathedral school at Brixen and repaired to Salzburg, where he studied theology, the Semitic languages, and history. At the university of Landshut, to which he next removed, he at first applied himself to jurisprudence, but soon again devoted his exclusive attention to history and philology. During the Napoleonic wars the still youthful student forsook his books, joined the Bavarian infantry in 1813, took part in a battle near Hanau, and accompanied his regiment to France. Receiving his discharge in 1818, he was successively engaged as teacher and professor in the gymnasium at Augsburg, and in the pro-gymnasium and lyceum at Landshut. The three years from 1831 to 1834 he spent in travel, along with the Russian Count Ostermann Tolstoi, visiting Egypt, Palestine, Syria, Cyprus, Rhodes, Constantinople, Greece, and Naples. On his return he was elected in 1835 a member of the Royal Bavarian Academy of Sciences, but he soon after left the country again on account of political troubles, and spent the greater part of the next four years with Count Tolstoi at Geneva. Constantinople, Trapezunt, Athos, Macedonia, Thessaly, and Greece were visited by him during 1840–41; and after some years' residence in Munich he returned in 1847 to the East, and travelled through parts of Palestine, Syria, and Asia Minor. The political changes in Bavaria invited him home in 1848, and he was appointed professor of history in the Munich university, and made a member of the national congress at Frankfort-on-the-Maine. He there joined the left or opposition party, and in the following year he accompanied the rump-parliament to Stuttgart, a course of action which naturally led to his expulsion from his professorate. During the winter of 1849–50 he was obliged to live in Switzerland to escape arrest, but the amnesty of April, 1850, enabled him to return to Munich. He died April 26, 1861. His contributions to the history of Greece in the Middle Ages are of great value; and though his theory that the Greeks of the present day are almost pure Slavonians, with hardly a drop of true Greek blood in their veins, has not been accepted *in toto* by other investigators, it has served to modify the opinions of even his greatest opponents. A criticism of his views will be found in Hopf's *Geschichte Griechenlands* (reprinted from Ersch and Gruber's *Encycl.*), and in Finlay's *History of Greece in the Middle Ages.*

His works are—*Geschichte des Kaiserthums Trapezunt*, Munich, 1827; *Geschichte der Halbinsel Morea im Mittelalter*, Stuttgart, 1830–36; *Ueber die Entstehung der Neugriechen*, Stuttgart, 1835; "Originalfragmente, Chroniken, u. s. w., zur Geschichte des K. Trapezunts," Munich, 1843, in *Abhandl. der. hist. Classe der K. Bayerisch Akad. v. Wiss.*; *Fragmente aus dem Orient*, Stuttgart, 1845; *Denkschrift über Golgotha und das heilige Grab*, Munich, 1852, and *Das Todte Meer*, 1853—both of which had appeared in the *Abhandlungen* of the Academy; *Das Albanesische Element in Griechenland*, III. parts, in the Abhandl. for 1860–66. After his death there appeared at Leipsic in 1861, under the editorship of A. Thomas, three volumes of *Gesammelte Werke*, containing *Neuen Fragmente aus dem Orient*, *Kritische Versuche*, and *Studien und Erinnerungen aus meinem Leben.* A sketch of his life will also be found in L. Steub, *Herbsttage in Tyrol*, Munich, 1867.

FALLOPIUS, or Fallopio, Gabriello (1523–1562), one of the greatest anatomists of his time, was a native of Modena. He studied medicine at Ferrara, and, after a European tour, became teacher of anatomy in that city. He thence removed to Pisa, and from Pisa, at the instance of Cosmo I., grand-duke of Tuscany, to Padua, where, besides the chairs of anatomy and surgery and of botany, he held the office of superintendent of the new botanical garden. He died October 9, 1562. Only one treatise by Fallopius appeared during his lifetime, namely the *Observationes Anatomicæ*, Venice, 1561. His collective works, *Opera genuina omnia*, were published at Venice in 1584. For an account of the services which Fallopius rendered to anatomical science, see Anatomy, vol. i. p. 709.

FALL RIVER, a city of the United States, Massachusetts, is situated on Mount Hope Bay, the north-east arm of Narraganset Bay, 46 miles S. of Boston. The Fall river, which here joins the Taunton, has a descent of 130 feet in less than half a mile, and its great water-power was at an early period of much advantage for the development of the manufactures of the town, but most of the mills are now driven by steam. The town is well built, and many of the streets are finely adorned with trees. The harbor on Taunton river is safe and easy of access, and has depth of water sufficient for the largest ships. Fall river has a large coasting trade, and is engaged in the whale and other fisheries. The total value of foreign and domestic imports for the year ending June 30, 1877, was $12,358, and of exports $4795. The principal industry is the manufacture of cotton goods, especially print cloths, but there are also woollen factories, bleaching works, foundries, a shipbuilding yard, and planing mills. In the neighborhood there are valuable granite quarries. Fall River is the terminus of the line of steamers in the route from New York to Boston. It was incorporated as a town in 1803, and received a city charter in 1854; and in 1862 Fall River, Newport county, with 3377 inhabitants, was added to it. The population in 1850 was 11,522, and in 1870, 26,766.

FALMOUTH, a municipal and parliamentary borough and market-town of England, county of Cornwall, on the south side of Falmouth Harbor, 15 miles N.N.E. of Lizard Point, and 267 miles W.S.W. of London. The town consists chiefly of a long and narrow street extending along the shore. The principal public buildings are the hall of the Cornwall Polytechnic Society, the mechanics' institute, the town-hall, and the market-house. In the early part of the 17th century Falmouth consisted only of a few fishermen's huts, but soon after this Sir John Killigrew, having obtained the permission of James I., constructed a new quay and laid the foundation of the present town. Its subsequent prosperity was a consequence of the excellence of its harbor, and its proximity to Land's End. For about 150 years it was the port from which the mail packets for the Mediterranean, Spain, the West Indies, and South America were despatched; and though these steamers now start from other ports it maintains steam communication with London, Liverpool, Dublin, Penzance, Plymouth, and Southampton. The harbor is one of the best refuges for shipping in England. Its entrance between St. Anthony's Head on the E. and Pendennis Castle on the W. is about a mile in width, and it thence stretches inland about five and a half miles. It has depth of water and excellent anchorage for the largest ships, and vessels of considerable burden can discharge their cargoes at the quay. In 1876 the number that entered the port was 803, with a tonnage of 118,617; the number that cleared 384, tonnage 26,522. The total value of imports was £240,474, and of exports £5261. The exports include copper, tin, tin-plates, woollen goods, and fish. Falmouth along with Penryn returns two members to parliament. The population of the municipal borough in 1871 was 5294.

FALSE POINT, a land-locked harbor in the Cuttack district of Orissa, situated in 20° 20′ N. lat. and 86° 47′ E. long., and reported by the famine commissioners in 1867 to be the best harbor on the coast of India from the Húglí to Bombay. It derives its name from the circumstance that vessels proceeding up the Bay of Bengal frequently mistook it for Point Palmyras, a degree further north. The anchorage is safe, roomy, and completely land-locked. The capabilities of False Point as a harbor remained long unknown, and it was only in 1860 that the port was opened. It was rapidly developed, owing to the construction of the Orissa canals. Two navigable channels lead inland across the Mahánadí delta, and connect the port with Cuttack city. The trade of False Point is chiefly with other Indian harbors, but a large export trade in rice and oil-seeds has sprung up with Mauritius, the French colonies, and France. False Point is now a regular port of call for Anglo-Indian coasting steamers. Its capabilities were first appreciated during the Orissa famine of 1866, when it afforded almost the only means by which supplies of rice could be thrown into the province. Between 1863–64 and 1874–75 the value of the export and import trade of False Point has increased from £51,921 to £261,212, or upwards of five times, and the number of vessels visiting the port from 16 to 110. A lighthouse is situated a little to the south of the anchorage, on the point which screens it from the southern monsoon, in 20° 19′ 52″ N. lat., 86° 46′ 57″ E. long.

FALSTER, an island in the Baltic, belonging to Denmark. It is richly wooded and well cultivated, and is very fertile, especially in fruits. Area, 180 square miles; population (1870), 27,763. See DENMARK.

FALUN, or FAHLUN, a town of Sweden, capital of a laen of the same name, which, however, is also called Dalarna or Dalecarlia, is situated in a bare and rocky country near the W. shore of Lake Runn, 73 miles W. of Gefle. The town is built chiefly of timber, and the inhabitants are mostly engaged in mining and smelting. West of the town are the celebrated Falun copper mines, the oldest and most celebrated in Europe. They are known to have been in existence 600 years ago, but probably their origin is some centuries earlier. Since the 17th century their produce has been gradually decreasing, and while in 1650 they produced nearly 3300 tons the total output in 1874 was only a little over 490 tons. In the town are museums of mineralogy and geology, a school of practical mining, a model room, and a large scientific library. The fumes arising from the copper-smelting works destroy vegetation in the vicinity of the town, but so far from being injurious to human life, they seem often to have acted as a preventative against cholera and other epidemic diseases. Connected with the copper works there are shot, sulphur, vitriol, and Indian red factories. The population of Falun in 1875 was 6694.

FAMAGOSTA. See CYPRUS.

FAMILY. Family is a word of which the etymology but partially illustrates the meaning. The Roman *familia*, derived from the Oscan *famel* (*servus*), originally signified the servile property, the thralls, of a master. Next, the term denoted other domestic property, in things as well as in persons. Thus, in the fifth of the laws of the Twelve Tables the rules are laid down:—SI. INTESTATO. MORITUR. CUI. SUUS. HERES. NEC. SIT. ADGNATUS. PROXIMUS. FAMILIAM. HABETO, and SI. AGNATUS. NEC. ESCIT. GENTILIS. FAMILIAM. NANCITOR; that is, if a man die intestate, leaving no natural heir, who had been under his *potestas*, the nearest agnate, or relative tracing his connection with the deceased exclusively through males, is to inherit the *familia*, or family fortune of every sort. Failing an agnate, a member of the *gens* of the dead man is to inherit. In a third sense, the Roman word *familia* was applied to all the persons who could prove themselves to be descended from the same ancestor, and thus the word almost corresponded to our own use of it in the widest meaning, as when we say that a person is "of a good family" (Ulpian, *Dig.*, 50, 16, 195, *fin.*). Leaving for a while the Roman terms, to which it will be necessary to return, we may provisionally define "family," in the modern sense, as the small community formed by the union of one man with one woman, and by the increase of children born to them. These in modern times, and in most European countries, constitute the household, and it has been almost universally supposed that little natural associations of this sort are the germ-cell of early society. The history with which, from childhood, we are best acquainted shows us the growth of the Jewish nation from the one household of Abraham. It is true that his patriarchal family differed from the modern family in one respect. It was polygamous, but, as female chastity was one of the conditions of the patriarchal family, and as descent through males was therefore recognized as certain, the plurality of wives makes no real difference to the argument. In the same way the earliest formal records of Indian, Greek, and Roman society show us the family firmly established, and generally regarded as the most primitive of human associations. Thus, Aristotle derives the first household (*οἰκία πρώτη*) from the combination of man's possession of property—in the slave or in domesticated animals—with man's relation to woman, and he quotes Hesiod: *οἶκον μὲν πρώτιστα γυναῖκα τε βοῦν τ' αροτῆρα* (*Politics*, 1, 2, 5). The village, again, with him is a colony or offshoot of the household, and monarchical government in states is derived from the monarchy of the eldest male member of the family. Now, though certain ancient terms, introduced by Aristotle in the chapters to which we refer, might have led him to imagine, as we shall see, a very different origin of society, his theory is, on the face of it, natural and plausible, and it has been almost universally accepted. The beginning of society, it has been said a thousand times, is the family, a natural association of kindred by blood, composed of father, mother, and their descendants. In this family, the father is absolute master of his wife, his children, and the goods of the little community; at his death, his eldest son succeeds him; and in course of time this association of kindred, by natural increase and by adoption, develops into the clan, *gens*, or *γένος*. As generations multiply, the more distant relations split off into other clans, and these clans, which have not lost the sense of primitive kinship, unite once more into tribes. The tribes again, as civilization advances, acknowledge themselves to be subjects of a king, in whose veins the blood of the original family runs purest. This, or something like this, is the common theory of the growth of society.

On the other side, the following facts are to be noticed:—(1) In many barbarous communities the family, in our sense of the word, does not exist. (2) The traditions of civilized races report a similar state of things in their early experience. (3) The domestic institutions of savages, and traces of the same manners among cultivated races, point to an age when the family was not constituted in the modern way. (4) The larger tribal associations of savages were clearly not developed out of the monogamous or patriarchal family. (5) The larger tribal associations of Greece, Rome, and India bear marks of having been evolved out of the tribal associations of savages. If these points can be proved, the family is not the earliest, but one of the latest conquests of civilization. We shall consider these points in order.

1. At whatever epoch civilized travellers have visited peoples of less cultivation, they have noted, with unconcealed surprise, not the family, but promiscuity and polyandry. They have found men and women living together in what seemed unregulated community, or they have found that the woman had several husbands, and often that these husbands were brothers. They have alleged that the woman, not the man, was really head of the household, that kinship was traced through the female line, on account of the certainty of that sort of genealogy, and consequently that a man's children belonged, not to his own family, but to that of the wife, in whose affections he had only a limited or transitory share. It may be presumed, with some confidence, that these customs, observed in lands and ages widely apart, cannot have grown out of the monogamous or patriarchal family as we know it. The limitless area in which such practices have been usual may be gathered from a few examples. Thus Herodotus says of the Agathyrsi, a Scythian people (iv. 104): "They have their women in common, that they may all be brothers of each other." The Nasamones (iv. 172) have similar customs; of the Massagetæ (i. 216) it is said that each marries a wife, *ταύτῃσι δὲ ἐπίκοινα χρέωνται.* Aristotle alludes to similar promiscuity among the Libyans (*Pol.*, ii. 3, 9); they have their women in common, and distribute the children by their likeness to the men. Diodorus Siculus reports the same manners among the Troglodytes and the Ichthyophagi on the coast of the Red Sea. The Auseis by the Libyan lake Tritonis, though they seem to have set store on the chastity of unmarried women, are said by Herodotus to have lived like cattle, with no permanent cohabitation (iv. 180). These are examples of reported promiscuity in ancient times. Though the observers may have overlooked, and probably did overlook, some regulations, yet it is plain that in the societies spoken of the monogamous or patriarchal family cannot have existed, and so cannot have been the germ of such wider tribal associations as were then established. Turning to modern savages, we find the custom of lending wives, as an act of friendliness and hospitality, very common. This may be no more than mere profligacy, in a society where male kin is recognized; but the marriage custom of Thibet, which assigns to a woman several brothers as joint husbands, cannot be thus explained. This amazing practice is the rule of life "among thirty millions of respectable people" (Wilson, *Abode of Snow*). As to the area over which some form of polyandry extends, the reader may consult Mr. M'Lennan's *Primitive Marriage* (Edinburgh, 1865, pp. 178, 183), where it is traced "to points half round the globe." Cæsar describes something like it among the inhabitants of Britain (*De Bello Gallico*, lib. v. c. 14): "Ten or twelve men have wives in common, and chiefly brothers share with brothers, and father with children." According to a fragment of Polybius, the same fraternal arrangement was not unknown among the Spartans.

Among the Nairs of Malabar, a woman has several husbands, but these are not brothers (*Asiatic Researches*, vol. v. p. 13; Hamilton's *Account of East Indies*, vol. i. p. 308; Buchanan's *Journey*, vol. ii. p. 411). Among the Nairs the woman lives with her mother or brothers, or in other cases has a house of her own, where she receives her husbands. "No Nair knows his father, and every man looks upon his sister's children as his heirs" (Buchanan, ii. 412). Some other examples of very loose relations between the sexes will be found in Mr. Herbert Spencer's *Principles of Sociology*, vol. i. chap. 5, 6. But, to be brief, we strike on instances as soon as we look below the surface of civilization. Thus, in the Marquesas Islands, Mr. Melville (*Narrative of a Four Months' Residence*, 1846, p. 212) describes polyandry, and asks, with some *naïveté*, "Where else could such a practice exist even for a single day?" He would have found the practice among the Tsonnotouan Iroquois. "La polygamie qui n'est pas permise aux hommes, l'est pourtant aux femmes" (Lafitau, *Mœurs des Sauvages Américains*, vol. i. p. 555, 1726). If we are to maintain, as it was usual to declare, that "it is difficult to say of what races of men it is *not* allowable to lay down that the society in which they are united was originally organized on the patriarchal model," we must believe that some strange necessity, or some monstrous profligacy destroyed the patriarchal model among the people whose manners we have been studying.

2. If we can trust the traditions of Indo-European and other polite peoples, they too once lived in a stage which can hardly be discerned from promiscuity, and they too allotted many husbands to one wife. Beginning with Greece, we find the legend in Suidas (p. 3102), that the women of Attica abandoned themselves to unchecked vice, and that the male parentage of children could not be ascertained. According to the story of Varro (Augustine, *De Civ. Dei*, l. xviii. c. 9), it was Cecrops, the serpent-king, who first instituted marriage, just as the Australian natives credit the lizard with the discovery. The Hindoos give it to Svetaketu, before whose date "women were unconfined, and roamed at their pleasure. . . . This ancient custom is even now the rule for creatures born as brutes . . . and it is still practised among the northern Kurus" (Muir, *Sanskrit Texts*, part ii. p. 336). The Egyptians attributed the origin of marriage to the rule of Menes; the Chinese, to Fohi. As to polyandry, among Aryans of India, a famous passage in the *Mahabharata* tells how the five brothers Pandava "married the fair Draaupadi with eyes of lotus blue." The whole legend of these princes is so marked with the stamp of polyandrous institutions that the very terminology of polyandry, the system of nomenclature called "classificatory," is retained. Grand-uncles, in this episode of the *Mahabharata*, as among the Red Indians, are called grandfathers, and uncles fathers.

If, then, the Aryan race was not originally organized like the polyandrous Thibetans, the legends which declare these facts are at least singular examples of "undesigned coincidence." Before coming to that conclusion, it is now necessary to examine certain symbolic customs, certain laws of inheritance and of prohibited degrees, and so to determine whether the looser relations of savages may not have been the material out of which the modern family was gradually fashioned. This can scarcely be called a new, though it has never been a popular opinion. Mr. Millar, professor of law in the university of Glasgow, expressed it distinctly in his *Origin of the Distinction of Ranks*, p. 47 (4th edition, Edinburgh, 1806).

3. If the practices which make kindred through males difficult or impossible to recognize were ever universally prevalent, they will have left vestiges of their existence in the custom of tracing descent through females. Again, where that custom is met with, though marriage has become fixed, and where women are mistresses of the household and heads of the family, it is not easy to give any other explanation of these facts than this, that they are survivals from a time when the union of the sexes was vague and temporary. Where, then, do we meet with examples of kindred traced through the female line? Kindred through women is recognized in Australia (with exceptions among certain tribes), in the Marianne Islands, in Fiji, Tonga, and some other isles of the Pacific, and in the Carolina Islands. Among the Kars of the Golden Chersonese, the tribes are divided into Sgans, who recognize male descent, and Pwos, who reckon by the mother's side. The natives of the province of Keang-se "are celebrated among the natives of the other Chinese provinces for the mode or form used by them in address, which is Laon peaon," paraphrastically translated (Morgan, *Systems of Consanguinity and Affinity of the Human Family*, p. 452), "Oh, you old fellow, brother mine by some of the ramifications of *female* relationship!" To select some more modern instances from M. Giraud Teulon's collections (*Origine de la Famille*, Geneva, 1874, p. 15), the Singhalese, the Nairs of Malabar, the Kocchs, an Indian tribe, and the Zaporogue Cossacks, with the red men of North America as a rule, and the Indians of British Guinea, to whom we may add many African tribes (Bowditch, *Mission to Ashantee*, p. 185, London, 1873; Munzinger, *Ost-Afrikanische Studien*, 1864), count kindred by the mother's side. Another collection of examples will be found in Mr. M'Lennan's *Primitive Marriage*. Strabo reports that among the Iberians women were heads of families (i. 214, 319; iii. 165), and Cordier (*Anciennes coutumes de Barége*) shows that among the Basques women inherited property to the exclusion of males as late as the eighteenth century. The legislation of the Revolution changed all this, but a popular song still testifies to the annoyance of *les héritières*. This ancient custom thus fulfils the proverb, "Tout finit par des chansons" (Giraud Teulon, *La Mère chez certains peuples de l'Antiquité*, Paris, 1867, p. 42). Among ancient peoples there are very many more or less distinct vestiges of female kinship. Herodotus, it is true, says of the Lycians (i. 173),

"This custom they have to themselves, and herein agree with no other men, in that they name themselves by the mother's side and not by the father's. And if one ask another who he is, he will recount his maternal descent, and reckon up his mother's maternal ancestors." Now, so far from this mode of deducing descent being peculiar to the Lycians, it was in vogue among the Locrians (Polybius, 12, v., and *Excerpta Hist. Græc. Frag.*, Rome, 1827, p. 384). In the bilingual Etruscan inscriptions, according to M. Giraud Teulon (*Origine de la Famille*, p. 21), to whom we owe many of these citations, "the Etruscan text contains only the name of the mother of the dead, while the Latin text gives that of the father." Certain Egyptian mortuary inscriptions give the name of the mother, while the accompanying Greek text gives that of the father. A stele found in the ruins of the temple at Napata by Mariette Bey (*Revue Archéologique*, May, 1873) shows us a monarch justifying his claim to the throne by enumerating the women of his maternal ancestry. Future historians will no doubt explain the apparent coexistence of two systems of kindred in Egypt. Meanwhile, it is noteworthy that Herodotus (ii. 35) declares that daughters were compelled by law to maintain their parents, while sons were free to do as they pleased. This report has been curiously confirmed by the legal documents of certain private Egyptian families, lately deciphered by M. Revillout. We see the woman mistress of the household, and owner of the property.

Many other ancient examples are published by the Baron d'Eckstein (*Revue Archéologique*, 1853), but M. d'Eckstein's speculations about race need not be accepted. Millar (*op. cit.*, p. 48) quotes some survivals of the custom of tracing pedigree and deriving condition through women: "If any one be born of a Campanian father, and a mother Puteolan, he is a Campanian citizen, unless, *by some particular custom* (*privilegio aliquo*), his *maternal* descent is to be reckoned." Among places where this local custom ruled, Delphi is mentioned. The great collections of the facts known about the ancient position of women as heads of the family is Bachofen's *Das Mutterrecht*, in which somewhat crude speculations about religion are introduced. The most classical example of a tradition of gynæcocracy is that often-quoted tale of Varro's preserved by St. Augustine (*De Civitate Dei*, lib. xiii. c. 9). In the time of Cecrops, the serpent-king, a dispute arose between Pallas and Poseidon, which was settled by the votes of the Athenians. In these days women possessed the franchise, and a woman's vote turned the scale in favor of Pallas. To appease Poseidon, the Athenian men resolved that women should no more be admitted to the assemblies, nor should children take their names from the mother's family. In this tradition survives a memory of the Red Indian and Australian practice, which makes the child belong to the mother's clan, and also a memory of the political rights, so to speak, which women enjoyed among the ancient Britons, among the Iroquois of Lafitau's time, and which take the shape of a considerable share in the despotism of African races. It may be said that if women have ever enjoyed these privileges it is odd that among the least cultivated peoples, such as the Australians, they are treated as slaves. The reply is—if the Australians were a people of barbaric wealth, like many African nations, and if the certainty of succession to the "royal stool" and the royal treasures were a matter of the utmost moment to the state, it is not improbable that the ancient custom of female kinship would have given, among them too, dignity, importance, and power to women. Thus we know from several sources that

> From the nobility of the mother
> Should always be the right to the sovereignty

among the Celts in Scotland (M'Lennan, *Primitive Marriage*, 1865, p. 86, quoting Nennius; the *Anglo-Saxon Chronicle*, Rolls series, p. 1). Even in the *Mahabharata* there is a vestige of this system. Vasouki, the Naga (serpent) king, wished to have an heir. Instead of marrying, he found a partner for his *sister* Djaratkarou. The sister's son succeeded. Compare Bowditch's *Ashantee* (p. 185), "Their extraordinary rule of succession excludes all children but those of a *sister*, and is founded on the argument that, if the wives of the brothers are faithless, the blood of the family is entirely lost in the offspring, but, should the daughters deceive their husbands, it is still preserved." In leaving this part of the subject we may ask, from what considerations, except those indicated by Bowditch, could the rule of inheritance by the mother's side have been derived?

4. It has been shown that the actual practices of many barbarous races make the existence of the patriarchal, and still more of the monogamous, family impossible, and that the traditions of the races called Aryan, with many fragments of their customs, testify to a similar state of things in the past experiences of nations now organized on the basis of the family. We must now ask—(1) Of what nature are the wider tribal associations of savages? (2) How did they come into existence? (3) Are there any vestiges of similar and similarly formed associations among peoples which now possess strict marriage and kinship through males? We find that the Australian black fellows and the red men of North America are grouped in *local tribes*, which generally are named from the lands they occupy. Thus, the Onondagas are people of the hills, the Mohawks people of the flint, the Senecas people of the great hills, the Oneidas people of the granite, and so forth (Morgan, *League of the Iroquois*, 1851). In Australia the tribes take the names of districts, as Ballarat, Wandyalloch, and Moreton Bay. Within these local tribes there are smaller associations, variously called "clans," "families," "septs," "tribes," by travellers. They are, as a rule, governed on this principle in Australia:—"All the children take after the clan of their mother, and no man can marry a woman of the same clan, although the parties be born of parents in no way related, according to our ideas" (G. S. Lang, *Aboriginals of Australia*, Melbourne, 1865, p. 10; Gray's *Journals*, etc., ii. 227). These smaller associations which may not intermarry are named after some animal, vegetable, or other natural object. A member of the Kangaroo associations may not slay or eat the kangaroo, which he holds in honor, and a Paddymelon must abstain from paddymelon. The obvious result of this scheme of prohibited marriage is to make every local tribe contain much the same assortment of smaller communities. Looking at North America, we find the local tribe of Senecas to be composed of sets of persons called by the name of Wolf, Bear, Turtle, Beaver, Deer, Snipe, Heron, Hawk, and many of the same names prevail among Cayugas, Oneidas, Mohawks, and the rest. Just as in Australia, no man may marry a woman of the same name, though she may have been born hundreds of miles away, and may be no sort of relation in our sense of the word. As in Australia, the animal or plant from which each association takes its name is sacred; in America it is called the totem. The oldest Iroquois totems seem, from many legendary and political proofs, to have been Wolf, Bear, and Turtle (Morgan, *Ancient Society*, 1877, p. 70; see, also, M'Lennan, *Fortnightly Review*, 1869–1870). Turning to Africa (Bowditch's *Mission to Ashantee*. p. 181), we read of similar institutions. Livingstone reports similar facts among the Bechwanas, Falkner among the Patagonians, Brooke among the Sea Dyaks, and Garcilasso de la Vega among the lower races of Peru.

The essential features of these associations and groups of kindred are, for our present purpose—(1) Their indubitable growth out of *female* kinship, and the rule which prohibits marriage between persons who are of the same name, and own descent from the same plant, animal, or thing; (2) their existence as stocks of different blood in the same local tribe; and (3) their acknowledgment of kinship with, and of the duty to support in war, or to revenge, other members of the same name. (On this point, see Morgan, *Ancient Society*, p. 78. Compare also *Ancient Society*, p. 175, as to the Louchoux or Kutchin of the Tukon River: "A man does not marry into his own class; . . . the children belong to the grade of the mother; . . . members of the same grade in the different tribes do not war with each other.") For convenience of nomenclature, we shall call all such associations *totem-kin*. The word totem points to the peculiarity of supposed descent from some natural object which gives the name, and "kin" is more convenient than "group" or "clan," because the same totem and the same name cover many scattered groups.

5. The question now rises, Do we meet similar associations among civilized peoples who now possess the family? First, we find Mr. Hart of Canton, saying (*Ancient Society*, pp. 364, 365): "In some parts of the country large villages are to be met with, in each of which there exists but one family name; thus in one district will be found, say, three villages, each containing two or three thousand people,

the one of the Horse, the second of the Sheep, and the third of the Ox family name. . . . Just as among the North American Indians husband and wife are always of different families,—that is, of different surnames. Custom and law alike prohibit marriage on the part of people having the same family surname. The children are of the father's family,—that is, they take his surname." (Compare *Narrative of Two Mahometan Travellers*, Pinkerton, vol. vii.) The Arabian travellers had the same law at home, prohibiting marriage between people of the same family name.

Looking at India we find in the *Institutes of Menu* (iii. 5) that a man of the twice-born classes may not marry "a woman descended from his paternal or maternal ancestors within the sixth degree, nor [in words believed to be a comment on the original] one who is known by her family name to be of the same primitive stock with his father." No one, that is to say, may marry within the *ghotra*, just as no Red Indian may marry within the limits fixed by the totem. If the ghotra was counted, or if the Chinese family name ran, on the female side, Chinese and Brahmans would be exactly in the position of Australian blacks, as far as prohibited degrees are concerned. Mr. Cunningham (*Digest of Hindu Law*, Madras, 1877) says that the old rule about the ghotra is falling into disuse, and that local custom in many places permits it to be disobeyed. Now, just as observers in India note this change of practice, so observers among the Red Indians and Australians note another change of practice. Kindred among these peoples is very gradually beginning to be reckoned by the male line; children are being counted among some tribes in the clan of the father (Morgan, p. 86).

Leaving India, and turning to Greece and Rome, we find the local tribe and, subordinate to the tribe, two forms of associations called the γένος and gens, which are prominent in early history and gradually die out. Thus, though in the Twelve Tables, as we have seen, the members of the gens succeed to the property of an intestate, yet in the 2d century Gaius declares (*Inst.* iii. 17) that all Gentile law had fallen into desuetude. The gens, then, was, as its very name implies, a form of kindred, but old and hastening to decay. The members of a gens, according to Cicero, had a common name, were born of free parents, and were those who *capite non sunt deminuti.* Festus adds that members of a gens are *ex eodem genere orti.*

It must be noticed that, though the members of a gens were of no recognizable kin to each other in one sense, yet they showed a certain *solidarité*—putting on mourning when one of the kin was in disgrace (Livy, vi. 20), sharing common religious rights peculiar to themselves, and at one time having a right to inherit property. All these things point to consciousness of distant blood-relationship. Still one feature of the ghotra seems absent. It is hardly proved that there was a time when Romans might not marry within the gens. Indications of the past existence of the rule are found in the fact that Roman genealogies do not, as it is said, show us examples of marriages between persons of the same gens. More to the point is Plutarch's statement (Περὶ αἰτίων Ῥωμαϊκῶν), "In times past it was unlawful for Romans to mary women of their own kin (συγγενίδας); . . . nay, they did not wed ladies in any degree connected with them by blood, just as now they do not take sisters or aunts, and it was long before they ventured to take cousins to wife." It seems then that, just as in the case of the contemporary ghotra of the Hindus, an ancient and wide prohibition to marry in the gens was thrown off by the Romans. Here it must be noted that the ghotra of the Hindu law of inheritance is not identical with the ghotra in which marriage is prohibited by custom. It is rather a body composed of all the cognates within certain large limitations.

In the example of the Greek γένος we again find the common name a patronymic, generally thought to be derived from a hero. We find that all who bore the name shared certain religious rights, and before Solon's date were co-heirs to property, and took up the blood feud if one of the γένος were slain. Yet the γεννῆται are often defined as *not* akin in blood, so entirely did the old sense of relationship dwindle, in Greece as in Rome. The lexicographers supposed that the γένη were constituted by legislative enactment, νόμῳ τινὶ ἔχοντες κοινωνίαν. (See Meier, *De Gentibus Atticis;* Philippi, *Der Areopag und die Epheten*, Berlin, 1874, p. 68; Schoemann, *Griechische Alterthümer*, Berlin, 1861, vol. i. p. 329, with Schoemann's theory of the growth of the γένος; F. Haase, *Die Athenische Stammverfassung;* also Grote's *History of Greece*, iii. 53.) Now, hard as it is to ascertain the exact nature of the γένος, and of its relation to the tribe, it seems, on the whole, more analogous to the totem-kin than to the caste or joint family of the modern Hindus. (See Sir Henry Maine, "South Slavonians and Rajpoots," *Nineteenth Century*, December, 1877.) A common name, co-heirship, the duty of avenging a member, all point to the idea of kinship. As to exogamy, a Greek could certainly marry in his own γένος, for the common name went by the father's side, and a Greek might marry his father's though not his mother's daughter. It has been argued that the prohibition to marry a uterine sister, though kinship in historic Greece went by the male line, indicates a past when the maternal tie was more strict,—when, in fact, a man who married his uterine sister married *within* the γένος, and a man who took his half-sister by the father's side married outside the γένος. Here it may be observed that Aristotle (*Pol.*, 1, 2, 5, 6) gives as very ancient synonyms of γεννῆται the terms ὁμογάλακτες (nourished on the same milk), ὁμοσίπνοι (eating from the same vessel), ὁμοκάπνοι (warmed by the same fire). These terms speak of a time when motherhood or fosterage, when community of shelter, not blood kinship, were the bonds that kept members of the same kin together. The words may be compared with Gaelic *teadhloch* and *coediche*, "Gaelic names for family, signifying, the first, having a common residence, the second those who eat together" (M'Lennan, *Prim. Mar.*, p. 154).

It has been usual, almost universal, to explain the Greek γένος and Roman gens by simply saying, like Mr. Freeman (*Comparative Politics*, Macmillan, 1873, p. 111), "The family grew into the clan, the clan grew into the tribe." Mr. Freeman says we can trace this process best "among men of our own blood." But when we examine the early associations of the English (Kemble's *Saxons in England*, vol. i. p. 458), we find, just as in America, just as in Australia, groups of kindred of the same name,—take Billing, by way of example,—scattered from north to south through all the local tribes. We have seen how this happens in America and Australia, we have seen that there the family, in Mr. Freeman's sense, does not grow into the clan. Did it do so in Attica and Italy, and, if so, how did a tribe, which was *ex hypothesi* but a swollen clan, contain so many stocks which claimed distinct origin and distinct mythical ancestors? How did these stocks come to be scattered through local tribes, not grouped in one? The growth of savage tribes is not a development of the family; tribes singularly like those of savages are found in early civilizations. Had the two kinds of kindred different origins?

There remains a point to notice. The thoroughly savage totem-kindreds revere the animal, plant, or other object from which they take their name and claim descent, and they use it as a badge. For Greek and Roman survivals of this usage see Plutarch, *Theseus;* M'Lennan, "The worship of plants and animals," in the *Fortnightly Review*, 1869, 1870; and the *Antiquities of Heraldry*, by W. S. Ellis, 1869. If the ordinary theory, that the tribe and clan are overgrown families, be rejected, the converse theory may be stated thus:—The totem-kindreds of savages grow up through exogamy and female kin. The change to male kinship (a change which is demonstrably taking place in America and Australia) produced something like the Chinese circle of relationship. The substitution of the name of a fictitious ancestor for that of the sacred plant, animal, or natural object produced a circle of affinity like the Hindu ghotra of customary religion.[1] The decay of the prohibition to marry within the kin united by the family name, like the growing laxity of rule in the ghotra, produced something like the Greek γένος and the Roman gens. Nothing remained but joint religious rites, a common place of burial, a common name, a vague feeling of connection, traditions of the prohibition to marry within the gens, the duty of taking up the blood-feud, and vestiges of the joint-heirship. In process of time the intenser affections of the family caused the old gentile ties to disappear, and gentile law became an empty memory.

---

[1] We have examples in Zulu-land of the declining belief in animal ancestry (Callaway's *Religion of the Amazulu*), and in Greek history we have frequent instances of the fictitious adoption of eponymous heroic ancestors.

It has been shown that arrangements ruder than the modern family exist among contemporary savages, and have existed among ancient peoples. It has been shown that these rude institutions produce large associations of men, tribes and totem-kindred, among savages, and that, by a series of changes, every one of which is exemplified in experience, the Greek and Roman gentes, the units of early political society, may have been developed out of barbarous groups. There are next certain customs to be examined, which tend, as far as they go, to show that civilized society passed through savage stages. The chief of these customs are the ceremony of capture and bridal etiquette. As to the ceremony of capture it is superfluous to say much, as the subject has been handled, with complete originality and copious illustrations, in M'Lennan's *Primitive Marriage.* The classic example of the ceremony of capture is thus stated by C. O. Müller (*History and Antiquities of the Doric Race*, English translation, Oxford, 1830, vol. ii. p. 298): "Two things were requisite as an introduction and preparation to marriage at Sparta: first, betrothing on the part of the father; secondly, *the seizure of the bride.* The latter was clearly an ancient national custom." Müller then describes the clandestine intercourse, which lasted for some time, before the man "brought his bride, and frequently her mother, into his house." The intercourse of bride and groom among the Iroquois of Lafitau's time was likewise clandestine. For the practice in Crete Müller quotes Strabo, x. 482, D. A similar custom prevailed in Rome (Apuleius, *De As. Aur.* iv.; Festus, *s. v.* "Rapi"), and was supposed to be derived from the time of the rape of the Sabines. Mr. M'Lennan finds the practice necessary to the constitution of the relations of husband and wife among the Calmucks, the Tunguzians, the Khonds, the Fuegians, the Welsh, the Arabs, the Irish, and various other races. He explains its existence by the institutions of exogamy (*i.e.*, the rule prohibiting marriage between people of the same blood), and by the prevalence of hostility between the tribes of rude times. Suppose the rule to exist that a man may not marry a woman of his own community, and suppose that, by an exhaustive division, all other communities without exception are hostile, he *must* steal a wife if he is to marry at all. The fiction of capture, as men grow more polite, will endure as part of the marriage ceremony when the need of the reality is passed. It is to be noticed that the theft of the woman is, in the fictitious capture, generally the work of more than one man, as it well might be, if the early marriages were polyandrous. If it be granted that the prohibition to marry within the community is as early as it is widely prevalent, this explanation of the form of capture will seem sufficient. The origin of the early prohibition will be discussed later. Thus, on the evidence of a sportive feature in the marriage ceremony of civilized peoples, a vestige is revealed of customs connected with a very early form of the family.

A strange piece of barbarous etiquette may hint that the kindred of the bride and groom were once hostile groups. The daughter-in-law, among many races, is forbidden to speak to her father-in-law; the mother-in-law must hide when she sees her son-in-law. The wives treat their husbands with what may be a survival of hostility, and never name them by their names. Examples are collected in Sir John Lubbock's *Origin of Civilization*, pp. 11, 12. The practices are found among races on the border of the Polar Sea, in the Rocky Mountains, in Southern Africa, among the Caribs, Mongols, and Calmucks, in China, in Siberia, and in Australia. To these instances adduced by Sir John Lubbock we may add Bulgaria (Dozon, *Chants Populaires Bulgares*).

Herodotus says (i. 146) that the wives of the early Ionians would not call their husbands by their names nor sit at meat with them, and instructed their daughters to practise the same reserve. The reason assigned is that the women were originally Carians, whose parents the Ionians had slain. It may be allowed that this world-wide practice, too, testifies to a time when men married out of their own group, and all groups were hostile each to the other. Perhaps the English local custom, which forbids the parents of bride and bridegroom to be present at the marriage ceremony, holds the same antiquity.

We have now to note the widespread existence of a system of nomenclature, which can hardly have arisen in times when the monogamous family was the unit of society. Mr. Lewis Morgan of New York was the discoverer of a custom very important in its bearing on the history of society. In about two-thirds of the globe persons in addressing a kinsman do not discriminate between grades of relationship. All these grades are merged in large categories. Thus, in what Mr. Morgan calls the "Malayan system," "all consanguinei, near or far, fall within one of these relationships—grand-parent, parent, brother, sister, child, and grand-child." No other blood-relationships are recognized (*Ancient Society*, p. 385). This at once reminds us of the Platonic Republic. "We devised means that no one should ever be able to know his own child, but that all should imagine themselves to be of one family, and should regard as brothers and sisters those who were within a certain limit of age; and those who were of an elder generation they were to regard as parents and grand-parents, and those who were of a younger generation as children and grand-children (*Timæus*, 18, Jowett's translation, first edition, vol. ii., 1871). This system prevails in the Polynesian groups, and in New Zealand. Next comes what Mr. Morgan chooses to call the Turanian system. "It was universal among the North American aborigines," whom Mr. Morgan styles Ganowanians. "Traces of it have been found in parts of Africa" (*Ancient Society*, p. 386), and "it still prevails in South India among the Hindus, who speak the Dravidian language," and also in North India, among other Hindus. The system, as Mr. Morgan says, "is simply stupendous." It is not exactly the same among all his miscellaneous "Turanians," but, on the whole, assumes the following shapes. Suppose the speaker to be a male, he will style his nephew and niece in the male line, his brother's children, "son" and "daughter," and his grand-nephews and grand-nieces in the male line, "grandson" and "granddaughter." Here the Turanian and the Malayan systems agree. But change the sex; let the male speaker address his nephews and nieces in the female line,—the children of his sister,—he salutes them as "nephew" and "niece," and they hail him as "uncle." Now, in the Malay system, nephews and nieces on both sides, brother's children or sisters, are alike named "children" of the uncle. If the speaker be a female, using the Turanian style, these terms are reversed. Her sister's sons and daughters are saluted by her as "son" and "daughter," her brother's children she calls "nephew" and "niece." Yet the children of the persons thus styled "nephew" and "niece" are not recognized in conversation as "grand-nephew" and "grand-niece," but as "grandson" and "granddaughter." It is impossible here to do more than indicate these features of the classificatory nomenclature, from which the others may be inferred. The reader is referred for particulars to Mr. Morgan's great work, *Systems of Consanguinity and Affinity of the Human Race* (Washington, 1871).

The existence of the classificatory system is not an entirely novel discovery. Nicolaus Damascenus, one of the inquirers into early society, who lived in the first century of our era, noticed this mode of address among the Galactophagi. Lafitau found it among the Iroquois. To Mr. Morgan's perception of the importance of the facts, and to his energetic collection of reports, we owe our knowledge of the wide prevalence of the system. From an examination of the degrees of kindred which seem to be indicated by the "Malayan" and "Turanian" modes of address, Mr. Morgan has worked out a theory of the evolution of the modern family. A brief comparison of this with other modern theories will close our account of the family. The main points of the theory are shortly stated in *Systems of Consanguinity*, etc., pp. 487, 493, and in *Ancient Society*, p. 384. From the latter work we quote the following description of the five different and successive forms of the family:—

> "I. *The Consanguine Family.* It was founded upon the intermarriage of brothers and sisters, own and collateral, in a group.
>
> "II. *The Punaluan Family.* It was founded upon the intermarriage of several sisters, own and collateral, with each others' husbands, in a group,—the joint husbands not being necessarily kinsmen of each other; also, on the intermarriage of several brothers, own and collateral, with each others' wives in a group,—these wives not being necessarily of kin to each other, although often the case in both instances (*sic*). In each case the group of men were conjointly married to the group of women.
>
> "III. *The Syndyasmian or Pairing Family.* It was founded upon marriage between single pairs, but without an exclusive cohabitation. The marriage continued during the pleasure of the parties.

> "IV. *The Patriarchal Family.* It was founded upon the marriage of one man with several wives, followed in general by the seclusion of the wives.
>
> "V. *The Monogamian Family.* It was founded upon marriage between single pairs with an exclusive cohabitation.
>
> "Three of these forms, namely, the first, second, and fifth, were radical, because they were sufficiently general and influential to create three distinct systems of consanguinity, all of which still exist in living forms. Conversely, these systems are sufficient of themselves to prove the antecedent existence of the forms of the family and of marriage with which they severally stand connected."

Mr. Morgan makes the systems of nomenclature proofs of the existence of the Consanguine and Punaluan families. Unhappily, there is no other proof, and the same systems have been explained on a very different principle (M'Lennan, *Studies in Ancient History*, pp. 372–407). Looking at facts, we find the consanguine family nowhere, and cannot easily imagine how early groups abstained from infringing on each other, and created a systematic marriage of brothers and sisters. St. Augustine, however (*De Civ. Dei*, xv. 16), and Archinus in his *Thessalica* (*Odyssey*, xi. 7, scholia B, Q) agree more or less with Mr. Morgan. Next, how did the consanguine family change into the Punaluan? Mr. Morgan says (*Ancient Society*, pp. 424, 428) brothers ceased to marry their sisters, because "the evils of it could not for ever escape human observation." Thus the Punaluan family was hit upon, and "created a distinct system of consanguinity" (*Ancient Society*, p. 384), the Turanian. Again, "marriages in Punaluan groups explain the relationships in the system." But (p. 386) Mr. Morgan provides himself with another explanation, "the Turanian system owes its origin to marriage in the group *and* to the gentile organization." He calls exogamy "the gentile organization," though, in point of fact, the only gentes we know, the Roman gentes, show scarcely a trace of exogamy. Again, "the change of relationships which resulted from substituting Punaluan in the place of Consanguine marriage turns the Malayan into the Turanian system" (p. 442, see too p. 387). In the same page (442) Mr. Morgan attributes the change to the "gentile organization," and, still in the same page, uses *both* factors in his working out of the problem. Now, if the Punaluan marriage is a sufficient explanation, we do not need the "gentile organization." Both, in Mr. Morgan's opinion, were efforts of conscious moral reform. In *Systems of Consanguinity* (p. 490) the gentile organization (there called tribal), that is, exogamy, is said to have been "designed to work out a reformation in the intermarriage of brothers and sisters." But the Punaluan marriage had done that, otherwise it would not have produced (as Mr. Morgan says it did) the change from the Malayan to the Turanian system, the difference in the two systems, as exemplified in Seneca and Tamil, being "in the relationships which depended on the intermarriage or non-intermarriage of brothers and sisters" (*Ancient Society*, p. 442). Yet the Punaluan family, though itself a reform in morals and in "breeding," "did not furnish adequate motives to reform the Malay system," which, as we have seen, it did reform (p. 388). The Punaluan family, it is suspected, "frequently involved own brothers and sisters" (p. 427); had it not been so, there would have been no need of a fresh moral reformation,—"the gentile organization." Yet even in the Punaluan family (*Ancient Society*, p. 488) "brothers ceased to marry their own sisters." What, then, did the "gentile organization" do for men? As they had already ceased to marry their own sisters, and as, under the gentile organization, they were still able to marry their half-sisters, the reformatory "ingenuity" of the inventors of the organizations was at once superfluous and useless. It is impossible to understand the Punaluan system. Its existence is inferred from a system of nomenclature which it does (and does not) produce; it admits (and excludes) own brothers and sisters. Mr. Morgan has intended, apparently, to represent the Punaluan marriage as a long transition to the definite custom of exogamy, but it will be seen that his language is not very clear nor his positions assured. He does not adduce sufficient proof that the Punaluan family ever existed as an institution, even in Hawaii. There is, if possible, a greater absence of historical testimony to the existence of the Consanguine family. It is difficult to believe that exogamy was a conscious moral and social reformation, because, *ex hypothesi*, the savages had no moral data, nothing to cause disgust at relations which seem revolting to us. It is as improbable that they discovered the supposed physical evils of breeding in and in. That discovery could only have been made after a long experience, and in the Consanguine family that experience was impossible. Thus, setting moral reform aside as inconceivable, we cannot understand how the Consanguine families ever broke up. Mr. Morgan's ingenious speculations as to a transitional step towards the gens (as he calls what we style the totem-kindred), supposed to be found in the "classes" and marriage laws of the Kamilaroi, are vitiated by the weakness and contradictory nature of the evidence (see Pritchard, vol. ii. p. 492; Lang's *Queensland*, Appendix; *Proceedings of American Academy of Arts*, etc., vol. viii. 412; *Nature*, October 29, 1874). Further, though Mr. Morgan calls the Australian "gentile organization" "incipient," he admits (*Ancient Society*, p. 374) that the Narrinyeri have totem groups, in which "the children are of the clan of the father." Far from being "incipient," the gens of the Narrinyeri is on the footing of the ghotra of Hindu custom. Lastly, though Mr. Morgan frequently declares that the Polynesians have not the gens (for he thinks them not sufficiently advanced), Mr. Gill has shown that unmistakable traces of the totem survive in Polynesian mythology.

There is the less necessity to believe, with Mr. Morgan, in the Punaluan and Consanguine families, because the evidence on which he relies, the evidence of the classificatory system, has been explained on a different theory by Mr. M'Lennan (*Studies in Ancient History, loc. cit.*), whose mode of conceiving the evolution of the family is, briefly stated, this. Primitive man was, as geology reveals him, gregarious. We have no sort of evidence as to his truly primitive manners, for all existing savages have had many ages of experience and, as it were, of education. It can hardly be supposed, however, that the earliest men had instinct against marriage with near kin. Their earliest associations would be based on the sentiment of kindred, not yet brought into explicit consciousness, and on community of residence. They would be named by the name of their group. The blood relation of the mother to the child would be the first they perceived. As time went on they could reason out other relationships through women, but male kinship would remain, though not unknown as a fact, unrecognized in custom, because, if harmony was to exist within the group, it could only be secured "through indifference and promiscuity," which made certainty of male parentage impossible. Now let it be supposed, as a vast body of evidence leads us to suppose, that female children were slaughtered as *bouches inutiles*. The result would be a scarcity of women within the group. To secure wives men would be obliged to steal them from other groups, which were, *ex hypothesi*, hostile. This is almost the state of things known to Montaigne (Cotton's translation, chap. xvii.), "where the servile condition of women is looked upon with such contempt that they kill all the native females and buy wives from their neighbors." Now, in each group, by the system of capture, are members of alien groups, namely, the women and their children, who, as we have seen, are recognized as connexions of the mothers, not the fathers. Let these practices be formed into customary law, refuse a man permission to marry a woman of his own stock-name (marked by the totem), and you have exogamy, or what Mr. Morgan calls "the gentile organization." Within the groups are several families of the earliest type, the female and her offspring. Next, conceive of the sets of mother's sons, as feeling a stronger bond of union between themselves and the other members of the group, and as living with their mother. They cannot marry their sisters (who are of the same name and totem as themselves), but they regard their sisters' children as their heirs. To their own putative children they can only make presents *inter vivos*, and the sisters are wedded each to a set of men in the manner of the Nairs. But, as property was amassed, the brothers would prefer to keep their property in the hands of their putative children, and "there would be a disposition in favor of a system of marriage which would allow of the property passing to the brother's own children" (*Prim. Mar.*, 242). This form of marriage would be the one prevailing in Thibet. The elder brother, the first to marry, would have some of the attributes of the paterfamilias. Thus the idea of fatherhood attained something like maturity. Chiefs, moreover, would secure one or more wives to themselves, and their example imitated would produce monandry. The old state of things would leave its trace in the levirate, the duty of "raising up seed to a brother." Even before these changes the custom of marrying out of the group would have introduced so many strangers of various names and totems, that the members of a local tribe could intermarry with one another and yet not violate the law of exogamy. Such a local tribe, flushed with success in war, might refuse to marry beyond its limits, and become, so to say, a caste divided into ghotras. Let this caste feign itself to be descended from a common ancestor (a process of which Sir John Lubbock gives many examples), and you have a caste believed to be of common blood, yet refusing to marry outside the blood,—that is, an endogamous tribe. Within this tribe (as it were by a reaction from the old kinship through females) grows kinship through males only, the agnatic system of Rome. The wife and children are the husband's property; agnates only can be a man's heirs, and, failing these, gentiles,—*i. e.*, members of the kin still denoted by the common name.

Many criticisms have been made, especially by Sir John Lubbock and Mr. Herbert Spencer (*Origin of Civilization*, third edition; *Principles of Sociology*, vol. i.), on the scheme here too briefly sketched. Sir John Lubbock holds that exogamy springs from marriage by capture (by which alone a member of a group could get a wife to himself), rather than marriage by capture from exogamy. Mr. Spencer advocates the action of various "conspiring causes," "the stealing of a wife might become the required proof of fitness to have one" (*op. cit.*, pp. 652, 653). The origin of exogamy lies so far behind us in the past that it may remain for ever obscure. It is probable that every variety of union of the sexes has existed, while it seems possible that a few have been passed through, as necessary stages, by all advancing races. In this notice we have said little of the custom by which a man is a member of several clubs of men, each with one wife in common.

No hard and fast theory is likely to be accepted as more than provisional in the present state of knowledge, when science has only for a few years been busily occupied in this investigation. (A. L.)

FAMINES. War, pestilence, and famine are regarded by many as the natural enemies of the human race; but in truth these are all more or less associated with the circumstances of civilization. In the highest state of civilized society there ought to be no war; there need be no pestilence; and famine alone would stand as being beyond the range of human prevention—subject to some conditions to be afterwards spoken of. The advancement in the social scale to a state of dependence upon cereal crops, while the facilities of intercommunication between different countries, or even parts of the same country, remained imperfect, led almost necessarily to the periodical recurrence of scarcity. Cereal crops are especially dependent upon conditions of climate for their regular production; and here at least are circumstances beyond human control.

In a matter of such practical importance as the failure of the regular supply of the food of the people, it is not desirable to rely upon merely theoretical surmises; nor is it necessary to do so. A table has recently been prepared[1] of over 350 famines which have occurred in the history of the world, beginning with those spoken of in the Scriptures as having been in Palestine and in the neighboring nations in the time of Abraham (Gen. xii. 10), and again in the time of Isaac (Gen. xxvi. 1); passing on to the seven years' famine in Egypt down through those which afflicted ancient Rome; enumerating in their order those which have visited the three divisions of the United Kingdom (by far the most numerous in the table—the records being more available), as also those devastating Europe in the Middle Ages; reviewing in special detail the 34 famines which have visited India, including, as the first recorded of this group, that of 1769–70 (above 20 have been on a large scale); and concluding with that terrible calamity which is now ravaging the populations in North China. It is not pretended that this table is entirely exhaustive. It is known that many famines have occurred in the Chinese empire of which no details have been found available; and it is supposed that many have desolated Persia and other portions of Asia of which exact particulars are not available. But as this is believed to be the only existing table of the kind, and as great pains have been taken to make it complete, it may for our present purpose be regarded at least as representative. We proceed, then, to an analysis of it, in view of ascertaining what have been the causes of famines,—a point of the first importance when we come to a consideration of the problem which will naturally force itself into prominence—can anything be done to avert these national calamities?

The analysis discloses the following causes, or we may perhaps more accurately say attributed causes—for in this matter we have to follow the authority of the original chronicle, or of such records as have reached us:—1, rain; 2, frost; 3, drought; 4, other meteorological phenomena; 5, insects and vermin; 6, war; 7, defective agriculture; 8, defective transport; 9, legislative interference; 10, currency restrictions; 11, speculation; 12, misapplication of grain. These causes are named, as far as may be, in the order of their importance. It is immediately noticeable that they form themselves into the two distinct groups of natural and artificial causes.

We proceed to consider the first group—*natural causes of famines.*

1. *Rain.*—By excess of rain floods are produced, the soil becomes saturated, and decomposition of the seed is occasioned. In hilly countries the seed is not unfrequently washed entirely out of the ground, and so is destroyed. This cause of famine applies in a marked manner to tropical countries, where the rains are so much of the nature of torrents that the evil presents itself in a magnified degree. Improved cultivation of the land, embracing good drainage, is providing the most effective remedy. Other forms of damage to grain crops result from rain, as where it occurs in undue quantities during the harvest season, and the crops are destroyed before they can be safely stored. This has constantly happened in the northern portions of our own kingdom, and in parts of continental Europe. Inundations from the sea, from rivers, from inland lakes, fall within this category, and great mischief has resulted from these in many parts of the world. White, in his *Natural History of Selborne*, gives scientific reasons why much-flooded lands remain infertile—the beneficial action of the earth-worms is thereby retarded.

2. *Frost.*—In temperate regions frost is a deadly enemy to vegetation in several forms. In the case of grain cultivation it may, by setting in early, prevent the efficient manipulation of the soil and the sowing of the autumn seed. Or by being protracted beyond the early months of the year, it will prevent spring sowing, and even seriously injure the young crops. Combined with rain it will frequently destroy the vitality of the seed while yet in the ground. In the northern part of our island it not unfrequently destroys the grain before it is fully harvested. Efficient drainage of the soil is almost as effective against the ravages of frost as against the damage from rain. Many famines in Great Britain have been shown to be directly the result of frost. In France, and other wine and olive producing countries, the damage occasioned by frost is immense. Such damage, as well as that occasioned by floods, is there a recognized branch of insurance business.

3. *Drought.*—In all climates of a tropical character drought plays an important part in retarding the development of vegetation. When combined with moisture, solar heat affords the most certain means of securing luxuriance; without the moisture there is absolute sterility. The early Bible records refer to the rising of the waters of the Nile as the event upon which the fertility of Egypt depends. About 1060 the overflowing of this great river failed for seven successive years, occasioning one of the greatest famines of history. Two provinces were wholly depopulated; and in another half the inhabitants perished. Even in temperate climates long-continued drought is very disastrous.

4. *Other Meteorological Phenomena.*—Under this general designation has to be included several causes more or less directly or remotely contributing to famines. (*a*) *Comets.*—The appearance of these has often coincided with periods of drought; they are also frequently associated with excessive heat. But heat, except in so far as it may superinduce drought, is not detrimental to the grain crops; while, in relation to fruit crops, and more especially that of the vine, not only is the quality of the produce greatly

---

[1] See *Statistical Journal*, vol. xli., paper by Mr. Cornelius Walford, F.I.A., F.S.S., etc., "On the Famines of the World, past and present."

enhanced, but frequently its quantity also. The sale of some of the comet-claret of 1811 recently at £12, 10s. per bottle in Paris is some evidence of the quality. (*b*) *Earthquakes.*—These would seem to have but little influence in producing famine, except in the immediate locality of their devastations. Where, however, they have produced irruptions of the sea or inland waters, which has not unfrequently been the case, the damage has been extensive. (*c*) *Hurricanes and Storms.*—These frequently produce widespread injury in the localities they visit. They also lead to irruptions of the sea, and to the overflow of rivers; but as a rule these occur at periods of the year when the grain and other crops are not sufficiently advanced to sustain serious damage by shaking or otherwise, or have been harvested. (*d*) *Hail-storms.*—These are usually local in their effects—rarely extending beyond 60 miles in their greatest length and some 6 miles in width, and are generally confined to much smaller limits. They are most destructive to grain and fruit produce of all kinds when they occur in severe form, and in the summer and autumn months—when they are most prevalent. The damage these occasion has long been the subject of insurance alike in England and other parts of Europe. In France hail-storms are of great frequency, and also of great severity.

5. *Insects, Vermin, etc.*—Insect plagues appear to have afflicted mankind from a very early period. Thus flies and locusts were among the plagues of Egypt, and concerning the latter we read (Ex. x. 14, 15): "Very grievous were they; before them there were no such locusts as they, neither after them shall be such. For they covered the face of the whole earth, so that the land was darkened; and they did eat every herb of the land, and all the fruit of the trees which the hail had left; and there remained not any green in the trees, or in the herbs of the field, through all the land of Egypt." The present writer travelled in 1874 through districts in the Western States of America devastated very much in the manner thus described. The famine now raging in North China began in one district at least by a visitation of locusts. In India such visitations have occurred several times. England has been visited on various occasions by plagues of insects, especially in 476 and again in 872. As to vermin, such as rats, mice, etc., destroying the crops, there are but few instances on record. In 1581 there was a plague of mice in Essex, and in 1812–13 a plague of rats in the Madras presidency, which in part occasioned the famine of that year.

We now turn to the *artificial causes* of famines, some of which hardly admit of being dealt with in the same detail.

6. *War.*—Warfare has a tendency to create famine in one or other of several forms. It too frequently retards cultivation, either by its direct operation, or indirectly by calling the agricultural classes to arms. By its agency, too, the crops of whole districts are either designedly destroyed or ruinously devastated. Famines in particular towns or localities are often occasioned by the establishment of blockades, or through supplies being otherwise intercepted or cut off. A large quantity of grain, too, is probably damaged every year by being kept in military stores in various parts of Europe; in the event of famine, however, these stores may become of immense value.

7. *Defective Agriculture.*—This may result from one of several causes, as ignorance, indifference, or unsuitability of climate or location. Where the produce of the soil but barely meets the current requirements of the inhabitants, it is clear that either the failure of one season's crops, or the sudden influx of any great number of strangers, may produce at least temporary famine. See Macaulay's *England*, vol. i. chap. 3, or Wade's *British History chronologically arranged*, under date 1549 to 1553, etc.

8. *Defective Transport.*—This may arise from such causes as bad roads or want of roads, absence of canals or want of shipping, or from wilful obstruction. In our own country we had the advantage of the great Roman roads from a very early period; but still for cross country purposes the roads remained very bad, or, indeed, did not exist, until comparatively recent times. In 1285 an Act was passed for widening the highways from one market town to another; "but this was intended rather to prevent robbery than to facilitate travelling" (Wade). In consequence of the bad state of the roads it has frequently happened that there was a famine prevailing in one part of the kingdom, with a superabundance of food in another. The introduction of canals, and subsequently of railroads, removed all possible difficulty in the United Kingdom. In India at the present moment the chief difficulty in connection with the famines is the want of the means of transport.

9. *Legislative Interference.*—It does not appear altogether certain whether legislative interference with respect to the import or export of grain originated in relation to the prevention of famines, or in the desire to advance agriculture or to keep down prices within the limits at one time prescribed by law. Probably all these causes contributed to the building up of the system of the Corn Laws, which were only repealed, at the indignant demand of the nation, as recently as 1846. It is clear that all legislative interference must be designed to interfere with the natural course of supply and demand; and to that extent it is dangerous. There is no doubt that the Corn Laws were often called into play to prevent exportation of grain; while they only admitted of its importation when prices reached or exceeded certain predetermined limits. It was the Irish famine of 1845–46 which at least hastened their final repeal.[1]

10. *Currency Restrictions.*—Under this head is mainly included the consideration of debasing the coin, and so lessening its purchasing power. But for very direct testimony on more than one occasion we should hardly have included this among the causes of famine. Thus Penkethman (who may be regarded as a high authority) says, under date 1124, "By means of changing the coine all things became very deere, whereof an extreme famine did arise, and afflict the multitude of the people unto death." Other instances, as in 1248, 1390, and 1586, are more particularly set out in the table of famines already referred to.

11. *Speculation.*—Under this head has chiefly to be considered that class of dealings known as "forestalling," "ingrossing," and trafficking by "regratours." Offences of this character were prohibited by statute in 1552 (5 and 6 Edward VI. c. 14), and it is seen that much importance was attached to them. Then there was the Act of 1555 (2 and 3 Philip and Mary, c. 15), "An Act that purveyors shall not take victuals within 5 miles of Cambridge and Oxford," on account of the poor estate of the multitude of scholars "having very bare and small sustentation." A further inquiry into the legislative measures taken in this direction would show how little removed from famine conditions were the people of England even at a comparatively recent period.

12. *Misapplication of Grain.*—Under this head is mainly to be noted the excessive use of grain in brewing and distilling, and by burning, whether wilfully or by misadventure. The laws regarding the burning of grain ricks were long and properly very severe, the punishment being capital until within a comparatively recent date. Under date 1315 we find it recorded that the Londoners, "considering that wheat was much consumed by the converting thereof into mault, ordained that from thence it was to be made of other grains." This order was afterwards extended by the king (Edward II.) through the whole kingdom. In later times distilling from grain has been prohibited.

It is clear from what has thus been said that the specific causes of famines which are denominated artificial have nearly all passed away, so far as Britain is concerned; but some of them still assert their force, especially in the East. As to India, the constantly recurring famines in the various provinces have caused great commiseration in England, and much anxiety and cost to the Government,—that of 1874 costing £6,500,000, that of 1877 nearly £10,000,000,—and have naturally drawn attention to the fact that the Indian empire, as a whole, produces year by year sufficient food for its aggregate population. The food supply fails at certain points; and there are no adequate means of transportation between the suffering provinces and others which have abundance. Hence millions starve; and hence, in the mean time, has arisen a fierce controversy between those who are in favor of canals, and water carriage generally, and the military authorities, who regard railways as of the first necessity—funds not being immediately forthcoming for both purposes.

There are other facts regarding the famines of India which require to be known, as they are contrary to the general belief. Thus Mr. F. C. Danvers says, in his able *Report on the Famines of India* (1878):—

---

[1] Edward I. "caused the wooll and leather to be stayed in England, and there followed great dearth of corne and wine."—Penkethman.

> "Famines in India have arisen from several different causes, but the most general cause has not been the failure of the usual rains. Distress has also, however, been caused by hostile invasion, by swarms of rats and locusts, by storms and floods, and not unfrequently by the immigration of the starving people from distant parts into districts otherwise well provided with food supplies, and occasionally by excessive exports of grain into famine-stricken districts, or by combinations of two or more of the above-mentioned circumstances."

Another point may be mentioned, which bears, not only upon the famines of India, but upon those of other countries where they are occasioned by deficiency of rain, or by too much rain, viz., the effect produced on the average rainfall by denuding a country of its growing timber. There can be no doubt that the rainfall in England has been much lessened by the continuous destruction of our forests and even of our hedgerows. In India the cutting down of timber for the purpose of supplying fuel to the locomotive engines on the railways has already produced noticeable effects. The authorities are happily alive to the fact, and remedial measures are already being taken. But other results are produced by the same cause. The testimony of the French forest department in the Hautes and Basses Alpes is strong, and reaches the practical question of floods and the damage they occasion. "So great indeed were the devastations from which these alpine districts suffered through the denudation of the mountain sides, and the consequent formation of torrents, that intervention of the most prompt description became necessary to prevent the destruction, not only of the grazing grounds themselves, but of the rich valleys below them." The replanting of these mountains had been going on for some time. "Already the beneficial effect of what has been done is felt in the diminution of the violence of the torrents. . . . During the present summer (1875), when so much mischief has been done in the south of France by inundations, the Durance, which rises in the mountains east of Avignon, and which, on former occasions, has been the worst and most dangerous of all the rivers in the south of France, on account of the inundations it has caused, has scarcely been heard of; and it is around the head waters of this river that the chief plantation works have, during the last ten years, been carried on."[1]

In connection with famines the "sun-spot" theory of rainfall has of late engaged much attention. The basis of this theory is that all the phenomena connected with the sun ebb and flow once in eleven years, and that from the relation of the earth to the sun these maximum and minimum periods regulate terrestrial phenomena. The sun's energy "gives us our meteorology by falling at different times upon different points of the aërial and aqueous envelopes of our planet, thereby producing ocean and air currents; while, by acting upon the various forms of water which exist in those envelopes, it is the fruitful parent of rain, and cloud, and mist. Nor does it stop here. It affects in a more mysterious way the electricity in the atmosphere, and the magnetism of the globe itself."[2] So far, however, as the tables illustrating the theory admit of comparison with the list of famines already referred to—and the tables extend to the rainfall (as indicated by floods), to frosts, to drought, and to other meteorological phenomena—there is no present evidence that such a theory can be upheld, even when applied to the famines of India only; and apparently still less when extended to those of the whole world. As to Mr. Jeula's tables of shipwrecks, which appear to follow the eleven years' theory, and to which the doctrine of recurrent storms, induced by the meteorological influences already named, has been applied—the explanation may be traced to other influences, such as mercantile depression, etc.

It remains to be added that to the direct influence of famines we owe our Poor Laws—that national system of insurance against starvation. "In the 29th yeare of Queen Elizabeth, about January [1586], Her Majesty observing the general Dearthe of Corne and other victual, groune partly through the unseasonablenesse of the year then passed, and partly through the uncharitable greediness of the Corne-Masters, but especially through the unlawful and over much transporting of graine in forreine parts; by the advice of Her most Hon. Privy Council, published a Proclamation, and a Booke of Orders to be taken by justices for reliefe of the Poore; notwithstanding all which the excessive prices of grain still encreased: so that wheate was sold at London for 8s. the Bushel, and in some other parts of the Realme above that price."—Penkethman. To the famine in India in 1781–3 was due the institution of the *Monegar Choultry*, or the Indian equivalent to the British Poor Law; while in connection with the Indian famine of 1790–2 was introduced the system of Government relief works, so extensively adopted at the time of the Irish famine of 1846–7 and the Lancashire cotton famine of 1861–5. The first recorded importation of grain into Great Britain took place during the great famine of 1258, when "fifty of shiploads of wheat, barley, and bread were procured from Germany"—hence the first incident which, at a later date, gave rise to our Corn Laws; and in many other ways famines have left their mark upon our history and our institutions. (C. W.)

FAN (Latin, *vannus;* French, *éventail*), a light implement used for giving motion to the air. *Ventilabrum* and *flabellum* are names under which ecclesiastical fans are mentioned in old inventories. Fans for cooling the face have been in use in hot climates from remote ages. A bas-relief in the British Museum represents Sennacherib with female figures carrying feather fans. They were attributes of royalty along with horse-hair fly-flappers and umbrellas. Examples may be seen in plates of the Egyptian sculptures at Thebes and other places, and also in the ruins of Persepolis. In the museum of Boulak, near Cairo, a wooden fan handle showing holes for feathers is still preserved. It is from the tomb of Amen-hotep, of the 18th dynasty, 17th century B.C. In India fans were also attributes of men in authority, and sometimes sacred emblems. A heart-shaped fan, with an ivory handle, of unknown age, and held in great veneration by the Hindus, was given to the prince of Wales. Large punkahs or screens, moved by a servant who does nothing else, are in common use by Europeans in India at this day.

Fans were used in the early Middle Ages to keep flies from the sacred elements during the celebrations of the Christian mysteries. Sometimes they were round, with bells attached—of silver, or silver gilt. Notices of such fans in the ancient records of St. Paul's, London, Salisbury cathedral, and many other churches, exist still. For these purposes they are no longer used in the Western church, though they are retained in some Oriental rites. The large feather fans, however, are still carried in the state processions of the supreme pontiff in Rome, though not used during the celebration of the mass. The fan of Queen Theodolinda (7th century) is still preserved in the treasury of the cathedral of Monza. Fans made part of the bridal outfit, or *mundus muliebris*, of ancient Roman ladies.

Folding fans had their origin in Japan, and were imported thence to China. They were in the shape still used—a segment of a circle of paper pasted on a light radiating frame-work of bamboo, and variously decorated, some in colors, others of white paper on which verses or sentences are written. It is a compliment in China to invite a friend or distinguished guest to write some sentiment on your fan as a memento of any special occasion, and this practice has continued. A fan that has some celebrity in France was presented by the Chinese ambassador to the Comtesse de Clauzel at the coronation of Napoleon I. in 1804. When a site was given in 1635, on an artificial island, for the settlement of Portuguese merchants in Nippo in Japan, the space was laid out in the form of a fan as emblematic of an object agreeable for general use. Men and women of every rank both in China and Japan carry fans, even artisans using them with one hand while working with the other. In China they are often made of carved ivory, the sticks being plates very thin and sometimes carved on both sides, the intervals between the carved parts pierced with astonishing delicacy, and the plates held together by a ribbon. The Japanese make the two outer guards of the stick, which cover the others, occasionally of beaten iron, extremely thin and light, damascened with gold and other metals.

Fans were used by Portuguese ladies in the 14th century, and were well known in England before the close of the reign of Richard II. In France the inventory of Charles V. at the end of the 14th century mentions a folding ivory fan. They were brought into general use in that country by Catherine de' Medici, probably from Italy, then in advance of other countries in all matters of personal luxury. The court ladies of Henry VIII.'s reign in England were used to handling fans. A lady in the Dance of Death by Holbein holds a fan. Queen Elizabeth is painted with a round feather fan in her portrait at Gorhambury; and as many as twenty-seven are enumerated in her inventory (1606). Coryat, an English traveller, in 1608 describes them as common in Italy. They also became of general use from that time in Spain. In Italy, France, and Spain fans had special conventional uses, and various actions in handling them grew into a code of signals, by which ladies were supposed to convey hints or signals to admirers or to rivals in society. A paper in the *Spectator* humorously proposes to establish a regular drill for these purposes.

[2] "Sun-Spots and Famines," by J. Norman Lockyer and W. W. Hunter, in *Nineteenth Century*, Nov., 1877, p. 583.

The chief seat of the European manufacture of fans during the 17th century was Paris, where the sticks or frames, whether of wood or ivory, were made, and the decorations painted on mounts of very carefully prepared vellum (called latterly *chicken skin*, but not correctly),—a material stronger and tougher than paper, which breaks at the folds. Paris makers exported fans unpainted to Madrid and other Spanish cities, where they were decorated by native artists. Many were exported complete; of old fans called Spanish a great number were in fact made in France. Louis XIV. issued edicts at various times to regulate the manufacture. Besides fans mounted with parchment, Dutch fans of ivory were imported into Paris, and decorated by the heraldic painters in the process called "Vernis Martin," after a famous carriage painter and inventor of colorless lac varnish. Fans of this kind belonging to the Queen and to the late baroness de Rothschild were exhibited in 1870 at Kensington. A fan of the date of 1660, representing sacred subjects, is attributed to Philippe de Champagne, another to Peter Oliver in England in the 17th century. Cano de Arevalo, a Spanish painter of the 17th century, devoted himself to fan painting. Some harsh expressions of Queen Christina to the young ladies of the French court are said to have caused an increased ostentation in the splendor of their fans, which were set with jewels and mounted in gold. Rosalba Carriera was the name of a fan painter of celebrity in the 17th century. Lebrun and Romanelli were much employed during the same period. Klingstet, a Dutch artist, enjoyed a considerable reputation for his fans from the latter part of the 17th and the first thirty years of the 18th century.

The revocation of the edict of Nantes drove many fan-makers out of France to Holland and England. The trade in England was well established under the Stuart sovereigns. Petitions were addressed by the fan-makers to Charles II. against the importation of fans from India, and a duty was levied upon such fans in consequence. This importation of Indian fans, according to Savary, extended also to France. During the reign of Louis XV. carved Indian and China fans displaced to some extent those formerly imported from Italy, which had been painted on swanskin parchment prepared with various perfumes.

During the 18th century all the luxurious ornamentation of the day was bestowed on fans as far as they could display it. The sticks were made of mother-of pearl or ivory, carved with extraordinary skill in France, Italy, England, and other countries. They were painted from designs of Boucher, Watteau, Lancret, and other "genre" painters. Hébert, Rau, Chevalier, Jean Boquet, Mad. Verité, are known as fan painters. These fashions were followed in most countries of Europe, with certain national differences. Taffeta and silk, as well as fine parchment, were used for the mounts. Little circles of glass were let into the stick to be looked through, and small telescopic glasses were sometimes contrived at the pivot of the stick. They were occasionally mounted with the finest point lace. An interesting fan (belonging to Madame de Thiac in France), the work of Le Flamand, was presented by the municipality of Dieppe to Marie Antoinette on the birth of her son the dauphin. From the time of the Revolution the old luxury expended on fans died out. Fine examples ceased to be exported to England and other countries. The painting on them represented scenes or personages connected with political events. At a later period fan mounts were often prints colored by hand. The events of the day mark the date of many examples found in modern collections. Amongst the fan-makers of the present time the names of Alexandre, Duvelleroy, Fayet, Vanier, may be mentioned as well known in Paris. The sticks are chiefly made in the department of Oise, at Le Déluge, Crèvecœur, Méry, Ste. Geneviève, and other villages, where whole families are engaged in preparing them; ivory sticks are carved at Dieppe. Water-color painters of distinction often design and paint the mounts, the best designs being figure subjects. A great impulse has been given to the manufacture and painting of fans in England since the exhibition which took place at South Kensington in 1870. Other exhibitions have since been held, and competitive prizes offered, one of which was gained by the Princess Louise. Modern collections of fans take their date from the emigration of many noble families from France at the time of the Revolution. Such objects were given as souvenirs, and occasionally sold by families in straitened circumstances. A large number of fans of all sorts, principally those of the 18th century, French, English, German, Italian, Spanish, etc., have been lately bequeathed to the South Kensington Museum.

Regarding the different parts of folding fans it may be well to state that the sticks are called in French *brins*, the two outer guards *panaches*, and the mount *feuille*. (J. H. P.)

FANO, a city of Italy in the province of Urbino-e-Pasaro, is situated in a rich and fertile plain on the shores of the Adriatic, at the mouth of the Metauro, 7 miles S.E. of Pesaro. The town is clean and well built, and is inclosed by old walls, with a lofty bastioned front towards the sea. Its cathedral is an unimposing structure, but some of the churches are fine buildings, richly adorned with marbles and frescoes, and containing several masterpieces of the great Italian painters. In the church of S. Francesco are the splendid tombs of the Malatestas. Fano has a Jesuit college, several monastic edifices, a gymnasium, a public library, and a large and finely adorned theatre. The harbor is so choked up with sand as to be accessible only to vessels of the smallest size. Some silk manufactures and a small trade in corn and oil are carried on, and the town is much resorted to for sea-bathing. The population in 1871 was 6439.

Fano occupies the site of the ancient *Fanum Fortunæ*, so named from the temple of Fortune there. It afterwards took the name of *Colonia Julia Fanestris*, from a colony of veterans established by Augustus; and a triumphal arch of white marble erected in honor of that emperor still forms one of the gates of the city. Though the town was within the duchy of Urbino it did not belong to the dukes, but was successively held by the Malatesta and the Sforza families, till in 1458 Pius II. incorporated it with the States of the Church. Fano is the birthplace of Clement VIII. It was there that the first printing press with movable Arabic types was established, in 1514, at the expense of Pope Julius II.

FANSHAWE, Sir Richard (1608–1666), poet and statesman, was the youngest son and tenth child of Sir Henry Fanshawe, remembrancer of the exchequer under James I. He was born early in June, 1608, at Wareham Park, Hertfordshire. At the age of seven he lost his father, and was soon placed by his mother under the care of the famous schoolmaster, Thomas Farnabie. In November, 1623, he was admitted fellow commoner of Jesus College, Cambridge, under Dr. Beale. In January, 1626, he entered the Middle Temple, but his mother dying soon after, and the study of the law being distasteful to him, he travelled in France and Spain, learning the languages of those countries, and observing the customs of the people. On his return, in 1635, he was appointed secretary to the English embassy at Madrid under Lord Aston, and was resident there until Sir Arthur Hopton's appointment in 1638. As soon as the civil war broke out he very prominently joined the Royalist party, being at this time on terms of somewhat affectionate intimacy with Charles I. In 1644, being with the court at Oxford, he had the degree of D.C.L. conferred upon him, and the same year he was appointed secretary at war to the prince of Wales, with whom he set out for the western counties, Scilly, and then Jersey. It was during this stormy period that Fanshawe first appeared as a poet: in 1647 he published his translation of the *Pastor Fido* of Guarini, the remaining copies of which he re-issued in 1648 with the addition of a number of other poems, original and translated. In 1648 his attention was again directed to public affairs by his appointment as treasurer to the navy under Prince Rupert, which he held till the latter was forced, in 1650, to escape to the West Indies. Fanshawe then proceeded to Paris, where he was created baronet, and sent to Madrid as envoy extraordinary. He was, however, immediately afterwards sent for to Scotland, but was captured on the way at the battle of Worcester in 1651. He was sent to London, and kept in such close confinement that his health broke down; but Cromwell, finding that he was really dangerously ill, allowed him to choose a place of residence, with the proviso that he was not to stir from it more than 5 miles. It was during his captivity that he published, in 1652, his *Selected Parts of Horace, Prince of Lyricks*, a very graceful work, in which he keeps as close as possible to the metrical form of the *Odes*. He chose to retire to Tankerley Park, in Yorkshire, the seat of Lord Strafford, and gave himself up entirely to literature. In 1654 he completed translations of two of the comedies of the Spanish poet Antonio de Mendoza, which were published after his death, in 1671, under the title of *Querer per solo querer: to Love only for Love's Sake, and Fiestas de Aranjuez*. But the great labor of his retirement was the translation of the national epic of the Portuguese poet Camoens. This version of the *Lusiad* was printed in folio in 1655, with very fine engravings. It is in ottava rima, and there is prefixed to it a translation of the long Latin poem entitled *Furor Petroniensis*, which forms an episode in the *Satyricon*. Moreover, in 1658 Fanshawe published a Latin version of the *Faithful Shepherdess* of Fletcher, and a letter dedicating the unprinted translations of Mendoza's plays to the queen of Sweden. In February, 1659, he broke through his bail, and joined Charles II. at Breda; he was enthusiastically received and loaded with promises. But when the Restoration was complete he did not, to his great disappointment, find himself made secretary of state. In 1661 he represented the university of Cambridge in parliament, and was presently sent out to Portugal as envoy extraordinary; he was shortly after appointed ambassador to the same court, and negotiated the marriage between Charles II. and the Infanta. At the end of the year he returned to England, only to be sent out as ambassador to Lisbon again in 1662. In 1663 he was recalled to be sworn one of his majesty's privy council. In the beginning of 1644 he was sent as ambassador to Philip IV. of Spain, and arrived at Cadiz in February of that year, to receive such an ovation as no English envoy had ever before enjoyed. During the whole of 1665 he was engaged in very delicate diplomatic relations between England, Portugal, and Spain; and in January, 1666, he travelled to Lisbon in the endeavor to bring about a peace between the last-mentioned powers. But he had scarcely returned to Madrid when he was somewhat peremptorily recalled to England. It is not known whether this affected his health, but at all events he fell ill at Madrid, and died there, after a short illness, on the 26th of June, 1666. His widow, Lady Fanshawe, drew up a charming memoir of her husband, which was first printed in 1829. To this circumstance and to his public position we owe the fact that of no poet of his age do we possess more copious materials for biography than of Fanshawe. He was a very tall courtly man, with short curling brown hair, and fine eyes. As an original poet we have very little means of judging his merit; a fine "Ode upon occasion of his Majesty's Proclamation in 1630," and some rough, but richly-colored sonnets, are the best of his own verses which have come down to us. But as a translator he is one of the illustrious figures in our literature, whether Italian, Latin, Portuguese, or Spanish attracts his versatile muse. His *Pastor Fido* and his *Lusiad* have never been surpassed by later scholars. As a verse-writer his chief fault is ruggedness; his active life gave him but scant opportunity for revision. His letters were edited in 1724 and since, but no collected edition of his works has ever been issued.

FARADAY, Michael, chemist, electrician, and philosopher, was born at Newington, Surrey, 22d September, 1791, and died at Hampton Court, 25th August, 1867. His parents had migrated from Yorkshire to London, where his father worked as a blacksmith. Faraday himself became apprenticed to Mr. Riebau, a book-binder. The letters written to his friend Benjamin Abbott at this time give a lucid account of his aims in life, and of his methods of self-culture, when his mind was beginning to turn to the experimental study of nature. In 1812 Mr. Dance, a customer of his master, took him to hear four lectures by Sir Humphry Davy. Faraday took notes of these lectures, and afterwards wrote them out in a fuller form. Under the encouragement of Mr. Dance, he wrote to Sir H. Davy, enclosing these notes. "The reply was immediate, kind, and favorable." He continued to work as a journeyman book-binder till 1st March, 1813, when, at the recommendation of Sir H. Davy, he was appointed assistant in the laboratory of the Royal Institution of Great Britain. He was appointed director of the laboratory 7th February, 1825; and in 1833 he was appointed Fullerian professor of chemistry in the Institution for life, without the obligation to deliver lectures. He thus remained in the Institution for 54 years. He accompanied Sir H. Davy in a tour through France, Italy, Switzerland, Tyrol, Geneva, etc., from October 13, 1813, to April 23, 1815.

Faraday's earliest chemical work was in the paths opened by Davy, to whom he acted as assistant. He made a special study of chlorine, and discovered two new chlorides of carbon. He also made the first rough experiments on the diffusion of gases, a phenomenon first pointed out by Dalton, the physical importance of which has been more fully brought to light by Graham and Loschmidt. He succeeded in liquefying several gases; he investigated the alloys of steel, and produced several new kinds of glass intended for optical purposes. A specimen of one of these heavy glasses afterwards became historically important as the substance in which Faraday detected the rotation of the plane of polarization of light when the glass was placed in the magnetic field, and also as the substance which was first repelled by the poles of the magnet. He also endeavored with some success to make the general methods of chemistry, as distinguished from its results, the subject of special study and of popular exposition. See his work on *Chemical Manipulation.*

But Faraday's chemical work, however important in itself, was soon completely overshadowed by his electrical discoveries. The first experiment which he has recorded was the construction of a voltaic pile with seven halfpence, seven disks of sheet zinc, and six pieces of paper moistened with salt water. With this pile he decomposed sulphate of magnesia (first letter to Abbott, July 12, 1812). Henceforward, whatever other subjects might from time to time claim his attention, it was from among electrical phenomena that he selected those problems to which he applied the full force of his mind, and which he kept persistently in view, even when year after year his attempts to solve them had been baffled.

His first notable discovery was the production of the continuous rotation of magnets and of wires conducting the electric current round each other. The consequences deducible from the great discovery of Örsted (21st July, 1820) were still in 1821 apprehended in a somewhat confused manner even by the foremost men of science. Dr. Wollaston indeed had formed the expectation that he could make the conducting wire rotate on its own axis, and in April, 1821, he came with Sir H. Davy to the laboratory of the Royal Institution to make an experiment. Faraday was not there at the time, but coming in afterwards he heard the conversation on the expected rotation of the wire.

In July, August, and September of that year Faraday, at the request of Mr. Phillips, the editor of the *Annals of Philosophy*, wrote for that journal an historical sketch of electro-magnetism, and he repeated almost all the experiments he described. This led him in the beginning of September to discover the method of producing the continuous rotation of the wire round the magnet, and of the magnet round the wire. He did not succeed in making the wire or the magnet revolve on its own axis. This first success of Faraday in electro-magnetic research became the occasion of the most painful, though unfounded, imputations against his honor. Into these we shall not enter, referring the reader to the *Life of Faraday*, by Dr. Bence Jones.

We may remark, however, that although the fact of the tangential force between an electric current and a magnetic pole was clearly stated by Örsted, and clearly apprehended by Ampère, Wollaston, and others, the realization of the continuous rotation of the wire and the magnet round each other was a scientific puzzle requiring no mean ingenuity for its original solution. For on the one hand the electric current always forms a closed circuit, and on the other the two poles of the magnet have equal but opposite properties, and are inseparably connected, so that whatever tendency there is for one pole to circulate round the current in one direction is opposed by the equal tendency of the other pole to go round the other way, and thus the one pole can neither drag the other round and round the wire, nor yet leave it behind. The thing cannot be done unless we adopt in some form Faraday's ingenious solution, by causing the current, in some part of its course, to divide into two channels, one on each side of the magnet, in such a way that during the revolution of the magnet the current is transferred from the channel in front of the magnet to the channel behind it, so that the middle of the magnet can pass across the current without stopping it, just as Cyrus caused his army to pass dryshod over the Gyndes by diverting the river into a channel cut for it in his rear.

We must now go on to the crowning discovery of the induction of electric currents.

In December, 1824, he had attempted to obtain an electric current by means of a magnet, and on three occasions he had made elaborate but unsuccessful attempts to produce a current in one wire by means of a current in another wire or by a magnet. He still persevered, and on the 29th August, 1831, he obtained the first evidence that an electric current can induce another in a different circuit. On September 23 he writes to his friend, R. Phillips—"I am busy just now again on electro-magnetism, and think I have got hold of a good thing, but can't say. It may be a weed instead of a fish that, after all my labor, I may at last pull up." This was his first successful experiment. In nine more days of experimenting he had arrived at the results described in his first series of "Experimental Researches" read to the Royal Society, November 24, 1841.

By the intense application of his mind he had brought the new idea, in less than three months from its first development, to a state of perfect maturity. The magnitude and originality of Faraday's achievement may be estimated by tracing the subsequent history of his discovery. As might be expected, it was at once made the subject of investigation by the whole scientific world, but some of the most experienced physicists were unable to avoid mistakes in stating, in what they conceived to be more scientific language than Faraday's, the phenomena before them. Up to the present time the mathematicians who have rejected Faraday's method of stating his law as unworthy of the precision of their science have never succeeded in devising any essentially different formula which shall fully express the phenomena without introducing hypotheses about the mutual action of things which have no physical existence, such as elements of currents which flow out of nothing, then along a wire, and finally sink into nothing again.

After nearly half a century of labor of this kind, we may say that, though the practical applications of Faraday's discovery have increased and are increasing in number and value every year, no exception to the statement of these laws as given by Faraday has been discovered, no new law has been added to them, and Faraday's original statement remains to this day the only one which asserts no more than can be verified by experiment, and the only one by which the theory of the phenomena can be expressed in a manner which is exactly and numerically accurate, and at the same time within the range of elementary methods of exposition.

During his first period of discovery, besides the induction of electric currents, Faraday established the identity of the electrification produced in different ways; the law of the definite electrolytic action of the current; and the fact, upon which he laid great stress, that every unit of positive electrification is related in a definite manner to a unit of negative electrification, so that it is impossible to produce what Faraday called "an absolute charge of electricity" of one kind not related to an equal charge of the opposite kind.

He also discovered the difference of the capacities of different substances for taking part in electric induction, a fact which has only in recent years been admitted by continental electricians. It appears, however, from hitherto unpublished papers that Henry Cavendish had before 1773 not only discovered that glass, wax, rosin, and shellac have higher specific inductive capacities than air, but had actually determined the numerical ratios of these capacities. This, of course, was unknown both to Faraday and to all other electricians of his time.

The first period of Faraday's electrical discoveries lasted ten years. In 1841 he found that he required rest, and it was not till 1845 that he entered on his second great period of research, in which he discovered the effect of magnetism on polarized light, and the phenomena of diamagnetism.

Faraday had for a long time kept in view the possibility of using a ray of polarized light as a means of investigating the condition of transparent bodies when acted on by electric and magnetic forces. Dr. Bence Jones (*Life of Faraday*, vol. i., p. 362) gives the following note from his laboratory book, 10th September, 1822:—

> "Polarized a ray of lamp-light by reflection, and endeavored to ascertain whether any depolarizing action (was) exerted on it by water placed between the poles of a voltaic battery in a glass cistern; one Wollaston's trough used; the fluids decomposed were pure water, weak solution of sulphate of soda, and strong sulphuric acid; none of them had any effect on the polarized light, either when out of or in the voltaic circuit, so that no particular arrangement of particles could be ascertained in this way."

Eleven years afterwards we find another entry in his notebook on 2d May, 1833 (*Life*, by Dr. Bence Jones, vol. ii. p 29). He then tried, not only the effect of a steady current but the effect on making and breaking contact.

> "I do not think, therefore, that decomposing solutions or substances will be found to have (as a consequence of decomposition or arrangement for the time) any effect on the polarized ray. Should now try non-decomposing bodies, as solid nitre, nitrate of silver, borax, glass, etc., whilst solid, to see if any internal state induced, which by decomposition is destroyed, *i. e.*, whether, when they cannot decompose, any state of electrical tension is present. My borate of glass good, and common electricity better than voltaic."

On May 6 he makes further experiments, and concludes—"Hence I see no reason to expect that any kind of structure or tension can be rendered evident, either in decomposing or non-decomposing bodies, in insulating or conducting states."

Experiments similar to the last-mentioned have recently been made by Dr. Kerr of Glasgow, who considers that he has obtained distinct evidence of action on a ray of polarized light when the electric force is perpendicular to the ray and inclined 45° to the plane of polarization. Many physicists, however, have found themselves unable to obtain Dr. Kerr's result.

At last, in 1845, Faraday attacked the old problem, but this time with complete success. Before we describe this result we may mention that in 1862 he made the relation between magnetism and light the subject of his very last experimental work. He endeavored, but in vain, to detect any change in the lines of the spectrum of a flame when the flame was acted on by a powerful magnet.

This long series of researches is an instance of his persistence. His energy is shown in the way in which he followed up his discovery in the single instance in which he was successful. The first evidence which he obtained of the rotation of the plane of polarization of light under the action of magnetism was on the 13th September, 1845, the transparent substance being his own heavy glass.

He began to work on August 30, 1845, on polarized light passing through electrolytes. After three days he worked with common electricity, trying glass, heavy optical glass, quartz, Iceland spar, all without effect, as on former trials. On September 13 he worked with lines of magnetic force. Air, flint, glass, rock-crystal, calcareous spar, were examined but without effect.

> "Heavy glass was experimented with. It gave no effects when the *same magnetic poles* or the *contrary* poles were on opposite sides (as respects the course of the polarized ray), nor when the same poles were on the same side either with the constant or intermitting current. But when contrary magnetic poles were on the same side there was an effect produced on the polarized ray, and thus magnetic force and light were proved to have relations to each other. This fact will most likely prove exceedingly fertile, and of great value in the investigation of the conditions of natural force."

He immediately goes on to examine other substances, but with "no effect," and he ends by saying, "Have got enough for to-day." On September 18 he "does an excellent day's work." During September he had four days of work, and in October six, and on 6th November he sent in to the Royal Society the nineteenth series of his "Experimental Researches," in which the whole conditions of the phenomena are fully specified. The negative rotation in ferro-magnetic media is the only fact of importance which remained to be discovered afterwards (by Verdet in 1856).

But his work for the year was not yet over On November 3 a new horseshoe magnet came home, and Faraday immediately began to experiment on the action in the polarized ray through gases, but with no effect. The following day he repeated an experiment which had given no result on October 6. A bar of heavy glass was suspended by silk between the poles of the new magnet. "When it was arranged, and had come to rest, I found I *could* affect it by the magnetic forces and give it position." By the 6th December he had sent in to the Royal Society the twentieth, and on 24th December the twenty-first, series of his "Researches," in which the properties of diamagnetic bodies are fully described. Thus these two great discoveries were elaborated, like his earlier one, in about three months.

The discovery of the magnetic rotation of the plane of polarized light, though it did not lead to such important practical applications as some of Faraday's earlier discoveries, has been of the highest value to science, as furnishing complete dynamical evidence that wherever magnetic force exists there is matter, small portions of which are rotating about axes parallel to the direction of that force.

We have given a few examples of the concentration of his efforts in seeking to identify the apparently different forces of nature, of his far-sightedness in selecting subjects for investigation, of his persistence in the pursuit of what he set before him, of his energy in working out the results of his discoveries, and of the accuracy and completeness with which he made his final statement of the laws of the phenomenon.

These characteristics of his scientific spirit lie on the surface of his work, and are manifest to all who read his writings. But there was another side of his character, to the cultivation of which he paid at least as much attention, and which was reserved for his friends, his family, and his church. His letters and his conversation were always full of whatever could awaken a healthy interest, and free from anything that might rouse ill-feeling. When, on rare occasions, he was forced out of the region of science into that of controversy, he stated the facts, and let them make their own way. He was entirely free from pride and undue self-assertion. During the growth of his powers he always thankfully accepted a correction, and made use of every expedient, however humble, which would make his work more effective in every detail. When at length he found his memory failing and his mental powers declining, he gave up, without ostentation or complaint, whatever parts of his work he could no longer carry on according to his own standard of efficiency. When he was no longer able to apply his mind to science, he remained content and happy in the exercise of those kindly feelings and warm affections which he had cultivated no less carefully than his scientific powers.

The parents of Faraday belonged to the very small and isolated Christian sect which is commonly called after Robert Sandeman. Faraday himself attended the meetings from childhood; at the age of thirty he made public profession of his faith, and during two different periods he discharged the office of elder. His opinion with respect to the relation between his science and his religion is expressed in a lecture on mental education delivered in 1854, and printed at the end of his *Researches in Chemistry and Physics.*

> "Before entering upon the subject, I must make one distinction which, however it may appear to others, is to me of the utmost importance. High as man is placed above the creatures around him, there is a higher and far more exalted position within his view; and the ways are infinite in which he occupies his thoughts about the fears, or hopes, or expectations of a future life. I believe that the truth of that future cannot be brought to his knowledge by any exertion of his mental powers, however exalted they may be; that it is made known to him by other teaching than his own, and is received through simple belief of the testimony given. Let no one suppose for an instant that the self-education I am about to commend, in respect of the things of this life, extends to any considerations of the hope set before us, as if man by reasoning could find out God. It would be improper here to enter upon this subject farther than to claim an absolute distinction between religious and ordinary belief. I shall be reproached with the weakness of refusing to apply those mental operations which I think good in respect of high things to the very highest. I am content to bear the reproach. Yet even in earthly matters I believe that 'the invisible things of Him from the creation of the world are clearly seen, being understood by the things that are made, even His eternal power and Godhead;' and I have never seen anything incompatible between those things of man which can be known by the spirit of man which is within him and those higher things concerning his future, which he cannot know by that spirit."

Faraday gives the following note as to this lecture:—

> "These observations were delivered as a lecture before His Royal Highness the Prince Consort and the members of the Royal Institution on the 6th of May, 1854. They are so immediately connected in their nature and origin with my own experimental life, considered either as cause or consequence, that I have thought the close of this volume not an unfit place for their reproduction."

As Dr. Bence Jones concludes—

> "His standard of duty was supernatural. It was not founded on any intuitive ideas of right and wrong, nor was it fashioned upon any outward experiences of time and place, but it was formed entirely on what he held to be the revelation of the will of God in the written word, and throughout all his life his faith led him to act up to the very letter of it."

FARCE. See DRAMA.

FAREHAM, a market-town of England, county of Hants, situated at the N.W. extremity of Portsmouth harbor, 73 miles by road and 84 by the South-Western Railway from London. The town consists chiefly of one wide street, and during the summer months is much resorted to for sea-bathing. It has a handsome assembly-room and other conveniences requisite for such places. The principal industries are the manufacture of sackings, ropes, coarse earthenware, terra-cotta, tobacco pipes, and leather. Fareham has a considerable trade in corn, timber, and coal. The population in 1871 was 7023.

FAREL, GUILLAUME (1489-1565), a celebrated French Reformer, was born near Gap in Dauphiny in 1489. He was of noble descent, and it was the wish of his parents that he should adopt the military profession, but the pursuit of knowledge proved so attractive to him that he characteristically determined to have his own way, and succeeded in obtaining permission to enter the university of Paris. Here he became the intimate friend of Jacobus Faber (Stapulensis), from whom in all probability he imbibed his first doubts regarding many of the usages and customs of the Roman Catholic Church. Through the introduction of Faber he was appointed professor to the college of Cardinal Lemoine, but not long afterwards, on the invitation of Bishop Briçonnet, he went to Meaux to assist Faber and others in preaching the doctrine of the Reformation. He was, however, compelled to leave France by the outbreak of the persecution of 1523, and went to Basel, where, in 1524, he defended the Reformation doctrines in a public disputation with great ability, but with such acrimonious keenness that Erasmus sided with the opponents of the Reformation in requiring his expulsion from the city. From Basel he went to Strasburg, and thence, on the invitation of the duke of Würtemberg, to Montbéliard, where he preached for a time with great success; but since, as usual, he forgot to temper his zeal with discretion, he was compelled to leave the town in the spring of 1525. He shortly afterwards began his Reformation crusade at Aigle in Switzerland, and notwithstanding the strenuous opposition of the monks, he, in 1528, obtained permission from the authorities to preach in any place within the canton of Bern. He also extended his itineracies to the cantons of Neufchâtel and Vaud, and although often seriously maltreated by the mobs whom he provoked by his violent invectives, continued his crusade in these districts with unabated zeal till 1531, when increasing manifestations of hostility rendered it imperative that he should seek another sphere for his labors. In that year, accordingly, he paid a short visit to the Waldenses, after which he went to Geneva, where he began to hold meetings of the Reformers in his private house. On this account he was summoned to appear before the bishop's vicar, and after being frequently insulted and threatened, during the progress of his trial, by the monks and canons, who drowned his defence by their clamor, he was rudely and violently pushed out of the court, and was commanded to leave the town within three hours. Escaping with great difficulty from the fury of his opponents, he went by sea to Orbe. In 1533, however, he returned to Geneva under the protection of the Government of Bern, and so successful were his sermons and his public disputations that in August, 1535, the town renounced the authority of the pope, and the simple worship of the Reformation was instituted in the churches. About this time Calvin visited Geneva, and Farel—whose superabounding zeal seems to have exercised a kind of spell over the calmer spirit of the great theologian—prevailed on him to give up all thoughts of a life of quiet study, and to devote himself to the cause of the Reformation in Geneva. Leaving Geneva to the care of Calvin, Farel returned to his work of itinerant preaching, chiefly in Neufchâtel, where, although the violent hostility of the priests and women showed no signs of diminution, he attracted large audiences, and gained a considerable number of adherents. At intervals he visited Geneva, over whose ecclesiastical affairs he seems to have exercised a kind of supervision; but the strictness of his doctrines and discipline gradually provoked the opposition of many of the inhabitants, and in 1538 he and Calvin were banished from the town. Farel went to Strasburg, and afterwards, in 1542, to Metz, where he labored with his usual energy and want of discretion, and with the usual mingled results. In 1541 Calvin was permitted to return to Geneva, and although Farel visited the town only at long intervals, he seems to have been consulted by Calvin in all important matters. When the trial of Servetus was in progress Farel was earnestly entreated by Calvin to be present before the case was finally decided, but he did not arrive until after the sentence of condemnation had been passed. He, however, accompanied the unhappy man to the place of execution, and continued until the last moment his exhortations to him to renounce his errors. About 1558 Farel married a young girl, and the marriage was the occasion of a quarrel between him and Calvin. Farel continued his labors with unabated zeal and vigor till 1565. In that year he visited Metz, where he had an enthusiastic reception, and preached with all his old fire and eloquence; but after returning to the house where he was residing, he was overpowered by exhaustion, from which he never rallied, dying on the 13th September. Farel wrote a considerable number of works, but as these were all thrown off in haste, and merely for a temporary purpose, it is scarcely fair to make them the criterion by which to estimate his powers as a thinker or theologian. His nature was, however, rather practical than meditative, the most remarkable features of his character being his dauntlessness and his untiring energy and zeal, in which respects he is perhaps to be ranked second to none of the Reformers with the exception of Luther, if he is to be considered second even to him. He possessed all but the greatest qualities of an orator, a sonorous and tuneful voice, appropriate gesture, fluency of language, and passionate earnestness. But although seldom failing to awaken the attention and interest of his large audiences, he often, by imprudent torrents of denunciation, aroused against his doctrines unnecessary opposition; and it would be difficult to determine whether, on the whole, the cause of the Reformation gained or lost by his advocacy. A monument to Farel was unveiled at Neufchâtel on the 4th of May, 1876.

See Ancillon, *Vie de Guillaume Farel*, Amster. 1691; Kirchhofer, *Das Leben Wilhelm Farel's*, 2 vols., Zurich, 1831–33; Schmidt, *Études sur Farel*, Stras. 1834; and Schmidt, *Wilhelm Farel and Peter Viret*, Elberfeld, 1860.

FARIA Y SOUSA, Manoel de (1590–1649), a Spanish and Portuguese historian and poet, was born of an ancient Portuguese family, probably at Pombiero, attended for several years at the university of Braga, and when about fourteen entered the service of the bishop of Oporto. With the exception of about four years (1630–1634), during which he held the post of ambassador to the papal court, the greater part of his later life was spent at Madrid, and there he died, after long-continued sufferings, on 3d June, 1649. He was a laborious, peaceful man; and a happy marriage with Catharina Machado, the Albania of his poems, enabled him to lead a studious domestic life, dividing his cares and affections between his children and his books. His first important work, an *Epitome de las historias Portuguezas*, Madrid, 1628, was favorably received; but some passages in his enormous *Commentary on the Lusiad* (2 vols., Madrid, 1639) excited the suspicion of the inquisitors, caused his temporary incarceration, and led to the permanent loss of his official salary. In spite of the enthusiasm which is said to have prescribed to him the daily task of twelve folio pages, death overtook him before he had completed his greatest enterprise—a history of the Portuguese in all parts of the world. Several portions of the work appeared at Lisbon posthumously, under the editorship of Captain Faria y Sousa:—*Europa Portugueza*, 1667, 3 vols.; *Asia Portugueza*, 1666, 1674, and 1675, 3 vols.; *Africa Portugueza*, 1681. As a poet Faria y Sousa was nearly as prolific; but his poems are vitiated by the prevailing Gongorism of his time. They were for the most part collected in the *Fuente de Aganipe*, of which four volumes were published at Madrid in 1644–46. A series of "Moral Dialogues," as the author intended to have called them, obtained from the publisher the fantastic title of the "Brilliant Nights"—*Noches Claras, Primera Parte*, 1624.

FARIDKOT, a feudatory state of North-Western India, under the political superintendency of the government of the Punjab, situated between 30° 40′ and 30° 56′ N. lat., and between 74° 22′ and 75° 9′ E. long. It is bounded on the W. and N.E. by the British district of Firozpur, and on the S. by Nábhá State. Area, 600 square miles; estimated population, 68,000; estimated revenue, £30,000. The rájá's military force consists of 200 cavalry, 600 infantry and police, and 3 field-guns. During the Sikh wars in 1845 the chief exerted himself in the English cause, and was rewarded with the title of Rájá, and an increase of territory. In the mutiny of 1857, too, he did good service by guarding the Sutlej ferries, and in attacking a notorious rebel, whose stronghold he destroyed.

FARIDPUR, or Furreedpore, a district of British India, in the Dacca division of Bengal, lies in 22° 47′ 53″–23° 54′ 55″ N. lat., and in 89° 21′ 50″–90° 16′ 0″ E. long. It is bounded on the N. and E. by the Ganges or Padmé river, separating it from Pubna and Dacca districts; on the W. by the Chandná and Madhumati rivers, separating it from Jessor; and on the S. by Bákarganj. The general aspect of the district is flat, tame, and uninteresting, although in the northern tract the land is comparatively high, with a light sandy soil, covered with water during the rainy season, but dry during the cold and hot weather. From the town of Farídpur the ground slopes, until in the south, on the confines of Bákarganj, it becomes one immense swamp, never entirely dry. During the height of the inundations the whole district may be said to be under water. The villages are built on artificially raised sites, or the high banks of the deltaic streams. Along many of the larger rivers the line of hamlets is unbroken for miles together, so that it is difficult to say where one ends and another begins. The huts, however, except in markets and bazaars, are seldom close together, but are scattered amidst small garden-plots and groves of mango, date, and betel-nut trees. The plains between the villages are almost invariably more or less depressed towards the centre, where usually a marsh, or lake, or deep lagoon is found. These marshes, however, are gradually filling up by the silt deposited from the rivers. In the north of the district there now only remain two or three large swamps, and in them the process may be seen going on. The climate of Farídpur is damp, like that of the other districts of Eastern Bengal; the average annual rainfall is 85·42 inches, and the average mean temperature 76·9° F.

The principal rivers of Farídpur are the Ganges, the Ariál Khán, and the Madhumati. The Ganges, or Padmá as it is locally called, touches the extreme north-west corner of the district, flows along its northern boundary as far as Goálandá, where it receives the waters of the Jamuna or main stream of the Brahmaputra, and whence the united stream turns southwards and forms the eastern boundary of the district. At the confluence of the two great rivers the current is so strong and the eddies and whirlpools so numerous, that the most powerful river steamers proceeding up stream during the flood season are often unable to make headway, and have to lie for days at Goálandá point until the river subsides. The Padmá is navigable by the largest cargo boats and river steamers throughout the year, its channel being estimated at an average of 1600 yards. The Ariál Khán is the principal branch of the Padmá. It takes off from the right bank of the parent stream a few miles below Farídpur town, and runs a south-easterly and southerly course till it leaves the district and flows into Bákarganj. The river is navigable by large cargo boats throughout the year, and has an average breadth during the rainy season of 1600 yards. The third great water-channel is the Madhumati (a continuation of the Garái branch of the Padmá), which forms the western boundary of the district. These rivers, but particularly the Padmá, are subject to constant alluvial changes on a large scale, and to repeated alterations in their course.

Rice, the great crop of the district, is divided into four distinct species, each with many minor varieties. These are—the *aman* or winter rice, which forms the principal harvest, and is the great staple of export; the *áus* or autumn rice; and the spring *boro* and *ráida* rice, both grown in swamps and deep water, and forming the common food of the people. The other cereal crops are wheat, barley, oats, and Indian corn; pulses, oilseeds, vegetables, fibres, sugar-cane, date-palms, indigo, safflower, betel-leaf, comprise the remaining important agricultural products. The area of the district, prior to recent changes of boundary, was 1506 square miles, of which 1143 were returned in 1871 as under cultivation, 133 as uncultivated but capable of tillage, and 230 as uncultivable. More than one-half of the whole cultivated area is under rice. The only natural calamity to which the district is subject to any serious extent arises from floods, which occasionally cause a general destruction of the crops. The three principal lines of road in Farídpur are the Calcutta and Jessor imperial road, 19 miles in length; Farídpur and Kálínagar road, 16 miles; Farídpur and Tálmá road, 10 miles. The Eastern Bengal Railway runs for 22 miles from west to east through the north of the district, having its terminus at Goálandá, at the junction of the Padmá and Jamuna rivers.

The census of 1872 showed a population of 1,012,589, 497,854 males and 514,735 females, inhabiting 2307 villages and 157,518 houses. The Mahometans number 588,299, or 58·1 per cent. of the whole; the Hindus, 420,988, or 41·6 per cent.; Christians, 463; and "others," 2839. The material condition of the population has considerably improved of late years, owing to the increase of tillage and the general rise in prices of agricultural products. Two towns contain a population exceeding 5000, viz.—(1) Farídpur, the chief town and administrative headquarters of the district: population in 1872, 8593; municipal revenue, £319, 3s. 7d.; expenditure, £213, 19s. 2d.; and (2) Sayyidpur: population, 6324; municipal revenue, £91, 4s. 9d.; expenditure, £136, 3s. 2d. The other towns or villages of importance as places of trade are—Bhángá, on the Kumár; Gopálganj, on the Madhumati; Boálmári, on the Barásiá; Madhukhálí and Betangá, on the Chándná; Kanáipur, on the Kumár; and Goálandá, on the Padmá.

The district has rapidly advanced in prosperity under British administration, especially of late years. In 1844–45 the total net revenue amounted to £9616, and the expenditure to £6004; in 1870–71 the net revenue was £58,868, and the expenditure £25,013. The land revenue, which in 1850 amounted to £3803 paid by 448 proprietors, had increased in 1870–71 to £27,263, derived from 3126 proprietors. The regular police force consisted in 1871 of 341 officers and men, costing £6425. A small municipal force of 20 men is kept up in the municipal towns of Farídpur and Sayyidpur. The rural police consisted in 1871 of 2026 men, and cost £7658, contributed by the landholders and villages. The schools in 1872–73 numbered 176, with 6497 pupils.

FARINA, or PORTO FARINA, a town of the regency of Tunis, at the mouth of the Madjerda (the ancient Bagradas), about 15 miles E. of Bizerta or Binzert. It lies in a very fruitful district, and was at one time the naval arsenal of Tunis; but its harbor has become very shallow, in all probability by the elevation of the coast, and its importance has consequently declined. The ruins on the west side of the river are identified with the ancient Utica. Quicksilver is obtained from the neighboring promontory. Population about 9000.

FARINATO, PAOLO (1522–1606), a painter and architect, was a native of Verona. He is sometimes named Farinato degli Uberti, as he came from the ancient Florentine stock to which the Ghibelline leader Farinata degli Uberti, celebrated in Dante's *Commedia*, belonged. He flourished at the same time that the art of Verona obtained its greatest lustre in the works of Paolo Cagliari (Paul Veronese), succeeded by other members of the Cagliari family, of whom most or all were outlived by Farinato. He was instructed by Niccolò Giolfino, and probably by Antonio Badile and Brusasorci. Proceeding to Venice, he formed his style partly on Titian and Giorgione, though he was never conspicuous as a colorist, and in form he learned more from the works of Giulio Romano. His nude figures show knowledge of the antique; he affected a bronzed tone in the complexions, harmonizing with the general gravity of his color, which is more laudable in fresco than in oil-painting. Vasari praised his thronged compositions and merit of draughtsmanship. His works are to be found, not only in Venice and principally in Verona, but also in Mantua, Padua, and other towns belonging or adjacent to the Venetian territory. He was a prosperous and light-hearted man, and continually progressed in his art, passing from a comparatively dry manner into a larger and bolder one, with much attraction of drapery and of landscape. The Miracle of the Loaves and Fishes, painted in the church of S. Giorgio in Verona, is accounted his masterpiece; it was executed at the advanced age of seventy-nine, and is of course replete with figures, comprising those of the painter's own family. A saloon was painted by him in S. Maria in Organo, in the same city, with the subjects of Michael expelling Lucifer, and the Massacre of the Innocents; in Piacenza is a St. Sixtus; in the Berlin gallery a Presentation in the Temple; and in the communal gallery of Verona one of his prime works, the Marriage of St. Catherine. Farinato executed some sculptures, and various etchings of sacred and mythologic subjects; his works of all kinds were much in request, including the wax models which he wrought as studies for his painted figures. He is said to have died at the same hour as his wife. His son Orazio was also a painter of merit.

FARINELLI (1705–1782), whose real name was CARLO BROSCHI, one of the most extraordinary singers that ever lived, was born January 24, 1705, at Naples (Burney), or according to Sacchi, his biographer, at Andria. Having been prepared for the career of a sopranist, he soon acquired a voice the beauty of which has never been surpassed, under the instruction of the celebrated Porpora. He became famous, while yet a boy, throughout southern Italy, where he was usually called *il ragazzo;* and in 1722 he made his *début* in "Eomene," written by his master, at Rome, where he created the greatest astonishment by vying with a celebrated German trumpet-player in holding and swelling a note of prodigious length and power. In 1724 he appeared at Vienna, and at Venice in the following year, and returned to Naples shortly afterwards. He sang at Milan in 1726, and in 1727 at Bologna, where he met for the first time the great artist, Bernacchi, to whose instruction he was indebted for some of his subsequent improvement. After revisiting Vienna, Farinelli, with ever-increasing success and fame, appeared in nearly all the great cities of Italy; and he returned a third time to Vienna in 1731. Here he received from Charles VI. a piece of sound criticism and kindly advice, which led him to acquire a pathos in his singing which he had not till then possessed, having hitherto always adhered to the florid, *bravura* style peculiar to the school of Porpora. After making another tour of the Italian cities he came to London in 1734, arriving here in time to lend his powerful support to the faction which had just set up an opposition to Handel; but not even his aid could make the undertaking successful, though he was assisted by Porpora and the celebrated Senesino. Having spent three years in England, Farinelli, loaded with presents, set out for Spain, staying a few months by the way in France, where he sang before Louis XV., and was rewarded with a handsome snuff-box containing the king's portrait set in diamonds, and 500 louis d'or. In Spain, where he had only meant to stay a few months, he ended by passing nearly twenty-five years. His voice, used by the queen to cure Philip V. of his melancholy madness, acquired for him, through the success of the treatment, an influence with that prince which gave him eventually the power, if not the name, of prime minister. This power he was wise and modest enough to use discreetly; and he always conciliated the enemies whom his favor raised up against him. He had, however, to pay for his position a price which to every artist must seem too heavy,—that of singing night after night to the king the same six songs, and never anything else. Under Ferdinand VI. he held the same place, and was decorated with the cross of Calatrava. He utilized his ascendency over this king by persuading him to establish an Italian opera. While at Madrid he heard of the death of Bernacchi, of whom he speaks in terms of affection and esteem in an extant letter addressed to the Padre Martini. Returning to Bologna, Farinelli spent the remainder of his days there in a melancholy splendor, and died July 15, 1782, aged 77. His voice was of large compass, possessing seven or eight notes more than those of ordinary singers, and was sonorous, equal, and clear; and he also possessed a great knowledge of music.

FARINI, Luigi Carlo (1812–1866), an Italian physician, statesman, and historian, was born at Russi in Ravenna, 22d October, 1812. After completing a brilliant university course at Bologna, he practised as a physician at Ravenna and at Russi. By his successful treatment of various diseases, and his communications to the Bolognese *Bollettino delle scienze mediche* and other scientific journals, he soon acquired a considerable reputation, but in 1843 his political opinions brought him under the suspicion of the police, and caused his expulsion from the Papal States. He then resided successively at Marseilles, Paris, Florence, and Turin, taking advantage of the facilities afforded him in each place to perfect his medical skill; but by the amnesty granted by Pius IX. on the 16th July, 1846, he was permitted to return to the States, and he received soon afterwards the professorship of clinical surgery at Osimo. In 1845 he published a pamphlet on the cultivation of rice in Italy. In 1847 he was induced to take advantage of an opportunity which then presented itself of entering political life, and became under secretary of state, holding office, however, for little more than a month, since, along with his colleagues, he disapproved of the policy of the pope in siding with Austria against the Italian states. Elected in 1848 member of the reformed parliament for Faenza, he was named director general of health and prisons, but refusing to adhere to the proclamation of a republic, he resigned the office in February, 1849, and passed into Tuscany. When the French army entered Rome in the following July he resumed his office, but the triumvirate of cardinals who governed in the name of the pope having compelled him, soon after his return, to go again into exile, he took up his residence at Turin, where he published a satirical paper *La Frusta*, contributed to the *Risorgimento*, and wrote the first part of his chief historical work *Storia dello stato Romano dal anno 1815 al 1850*, which he published in 1850. In the same year he was named by the Sardinian Government member of the upper council of health; and in 1851 he was appointed minister of public instruction, an office which he held till May, 1852. As a member of the Sardinian parliament, and as proprietor and editor of a political journal, *Il Piemonte*, Farini was one of the most influential supporters of the policy of Cavour, and in 1859 he was sent by the latter on a political mission to Parma and Modena. On the flight of the duke of Modena in June, 1859, Farini was entrusted with the provisional government of the town, in which capacity he negotiated the annexation of the duchy to Piedmont. The same year saw the publication of the second volume of his *Storia*. In June, 1860, he was named by Cavour minister of the interior, but resigned the office on the death of Cavour in June of the following year. On the 8th December, 1862, he succeeded Rattazzi as president of the cabinet, in which office he endeavored to carry out the policy inaugurated by Cavour. Over-exertion, however, brought on softening of the brain, which compelled him to resign his office 24th March, 1863, and ultimately resulted in his death at Quarto, near Genoa, 1st August, 1866. His remains, originally buried at Turin, were in 1878 removed to his native town of Russi, and monuments to his memory have been erected both there and at Ravenna.

Several letters addressed by Farini to Mr. Gladstone and Lord John Russell, on the affairs of Italy, were reprinted in the appendix to a *Mémoire sur les Affaires d'Italie*, 1859, and a collection of his political correspondence was published at Paris in 1860, under the title *Lettres sur les Affaires d'Italie*. His historical work was translated into English, the first part by Mr. Gladstone, and the second by a lady under his superintendence. A French translation of the work appeared in 1862. See Ettori Parri, *Luigi Carlo Farini: Commemorazione*, Rome, 1878.

FARMER, Hugh (1714–1787), an English theologian, was born in the neighborhood of Shrewsbury in 1714. About 1730 he entered the theological academy at Northampton taught by Dr. Doddridge, and on completing his studies he was appointed to a charge at Walthamstow in Essex, officiating at the same time as chaplain to a wealthy gentleman in the neighborhood in whose house he lived. He soon, however, resigned his chaplaincy, and took up his residence in the house of another member of his congregation, where he continued to live till his removal to London in 1761, on his acceptance of an invitation to become the afternoon preacher at Salter's Hall. There he was also soon afterwards appointed one of the Tuesday lecturers. He died 5th February, 1787.

His first work of importance was published in 1761, under the title of *An Inquiry into the Nature and Design of our Lord's Temptation in the Wilderness*, and was designed to prove that the temptation of Jesus took place only in vision, and was a prefiguration of his future life and ministry. In 1771 appeared his *Dissertation on Miracles, designed to show that they are Arguments of a Divine Interposition, and absolute Proofs of the Mission and Doctrine of a Prophet.* In 1775 he published an *Essay on the Demoniacs of the New Testament*, and in 1783 a treatise entitled *The General Prevalence of the Worship of Human Spirits in the Ancient Heathen Nations asserted and proved.* See *Memoirs of Hugh Farmer*, edited by Michael Dodson, 1804.

FARMER, Richard (1735–1797), the Shakespearian commentator, was born at Leicester in 1735. He was educated first at the free grammar school of his native town, and afterwards at Emmanuel College, Cambridge, of which in 1760 he became classical tutor, and in 1775 master, in succession to Dr. Richardson, the biographer of the English bishops. In the latter year also he was appointed vice-chancellor, and three years afterwards chief librarian of the university. In 1780 he was appointed to a prebendal stall in Lichfield, and in about two years more to one at Canterbury; but the second office he exchanged in 1788 for that of a canon residentiary of St. Paul's. Cambridge, where he usually resided, was indebted to him for improvements in lighting, paving, and watching; but perhaps London and the nation have less reason to be grateful for his zealous advocacy of the custom of erecting monuments to departed worthies in St. Paul's. In 1765 he issued a prospectus for a history of the town of Leicester; but this work, based on materials collected by Thomas Stavely, he never even began; it was finished by the learned printer, John Nichols. In the year after the publication of his Leicester "proposal" he gave to the world his famous *Essay on the Learning of Shakespeare*, in which he proved that the bard's acquaintance with ancient and modern Continental literature was exclusively derived from translations, of which he copied even the blunders. "Shakespeare," he said, "wanted not the stilts of language to raise him above all other men." "He came out of nature's hand, like Pallas out of Jove's head, at full growth and mature." "One might," he said—by way of ridiculing the Shakespearian criticism of the day—"with equal wisdom, study the Talmud for an exposition of *Tristram Shandy*." For wealth of information, terseness of language, and force of demonstration, the essay is unsurpassed by any work of the kind. It fully justifies the author's description of himself in the preface to the second edition, "I may consider myself as the pioneer of the commentators; I have removed a deal of learned rubbish, and pointed out to them Shakespeare's track in the ever pleasant paths of nature." Farmer died at Cambridge on the 8th September, 1797. He was, it appears, twice offered a bishopric by Pitt, but declined the preferment. From all that is known of him it may be inferred that Farmer's habits of life were scarcely compatible with episcopal reserve and dignity. He has been described as being more of a boon companion than a clergyman; and for a clergyman, he was too intimate with the play-house, on Shakespearian occasions especially.

For details of Farmer's life see the *Literary Anecdotes*, etc., of John Nichols.

FARNABIE, or Farnaby, Thomas (1575–1647), grammarian, classical commentator, and one of the most noted schoolmasters of his day, was a native of London. He was the son of a carpenter; his grandfather, it is said, had been mayor of Truro, and his grandfather an Italian musician. Between 1590 and 1595 he appears successively as a student of Merton, a pupil in a Jesuit college in Spain, and a follower of Drake and Hawkins during their expedition in the last-named year. After some military service in the Low Countries, "he made shift," says Wood, "to be set on shore in the western part of England; where, after some wandering to and fro under the name of Tho. Bainrafe, the anagram of his surname, he settled at Martock, in Somersetshire, and taught the grammar school there for some time with good success. After he had gotten some feathers at Martock, he took his flight to London," and opened a school in Goldsmith's Rents, Cripplegate. From this school, which contained as many as 300 pupils, there issued, says the same authority, "more churchmen and statesmen than from any school taught by one man in England." In the course of his London career "he was made master of arts of Cambridge, and soon afterwards incorporated at Oxon." Such was his pecuniary success in the metropolis that he was enabled to buy an estate at Otford, near Sevenoaks, Kent, to which he retired from London in the year 1636, still, however, carrying on his profession of schoolmaster, his pupils, it appears, being all, or nearly all, boarders—the sons of noblemen and gentlemen. In course of time he increased his property at Otford, and bought another estate near Horsham in Sussex. In politics he was a Royalist; and it was in consequence of his suspected participation in the rising near Tunbridge, 1643, that the parliament discussed a proposal for his banishment to America, and eventually imprisoned him in Ely House, Holborn. He died in June, 1647. These details of his life were derived, by Anthony à Wood, from Francis, Farnabie's son by his second wife, who was the daughter of Dr. Howson, bishop of Durham. His works chiefly consisted of annotated editions of Juvenal, Persius, Seneca, Martial, Lucan, Virgil, Ovid, and Terence. His *Systema Grammaticum* was published in London in 1641. On 6th April, 1632, Farnabie was presented with a royal patent granting him, for the space of twenty-one years, the sole right of printing and publishing certain of his works.

FARNESE, the name of a noble Italian house, to which belonged Pope Paul III., the celebrated Elizabeth, wife of Philip V. of Spain, and a long line of princes of Parma, including the great governor of the Netherlands. The first member of the family known in history was Ranuccio Farnese, a successful general of the church, who held the papal fiefs of Farnese and Montalto in the 13th century. Several of his descendants also fought with distinction in the armies of the Holy See, and others allied themselves with Florence, Venice, Siena, and other states, among whom may be mentioned Pietro Farnese, who led the Florentines to victory over Pisa in the middle of the 14th century. The historical importance of the Farnesi dates, however, from the accession of Alessandro Farnese to the papal throne as Paul III. Through his unblushing nepotism the dignity and domains of the family were greatly enlarged. For its aggrandizement the fiefs of Parma and Piacenza, Castro, and Camerino were alienated from the papacy; the marquisate of Novara was obtained from Charles V.; and marriages were arranged which allied it with the royal houses of Spain and France.

Pierluigi Farnese (1493–1547), born in 1493, was the natural son of Pope Paul III., who appointed him gonfaloniere, or captain-general of the armies of the church, created him sovereign duke of Parma and Piacenza, and obtained for him the much coveted dignity of patrician of Venice. His character was shamelessly vicious and tyrannical. He deprived his nobles of their most dearly cherished privileges, forbade them to maintain armed retainers, and forced them, on pain of confiscation, to leave their estates and reside in the towns. His cruelty appeared in his ruthless massacre of the people of Perugia, who had revolted against his father; and his uncontrollable passion in the outrage he committed against the bishop of Fano. At length a conspiracy against him was formed among his own subjects, assisted by Ferrante Gonzago, the imperial governor of Milan, and he was assassinated in his palace. His body was flung from the window, and dragged by the mob in triumph through the streets, September 10, 1547. (See Affo, *Vita Pierluigi Farnese.*)

Pierluigi had several children, for all of whom Paul made a careful and generous provision. The eldest, Alessandro Farnese (1519–1589), was, while a mere child, created bishop of Parma by Clement VII., and he was only fourteen when his grandfather, Paul III., appointed him cardinal. He was a man of learning, and of artistic tastes. It was he who completed the Farnese palace. He also displayed the diplomatic ability which appeared natural to his family, as papal envoy to Germany, France, and the Low Countries. Orazio, the third son of Pierluigi, Paul created duke of Castro, and married to Diana, natural daughter of Henry II. of France. His fourth son, Ranuccio, was made a cardinal when fourteen years of age.

Ottavio Farnese (1520-86), the second son and successor of Pierluigi, was born in 1520. The marquisate of Novara was obtained for him as an imperial fief by his grandfather Paul III., in pursuance of whose policy he was married at twelve years of age to Margaret of Austria (see Margaret of Parma), daughter of Charles V., and widow of the debauched Alessandro de' Medici. She was then twenty, and not unnaturally looked with dislike upon the boy bridegroom to whom she was compelled to unite herself. For several years she refused to live with him; but after his return, wounded, from the expedition into Barbary, in which he had fought bravely under her father, her aversion seems to have entirely disappeared. But a life of activity and independence was best suited to her character, and in 1559 she again separated from him, being appointed governor of the Netherlands, which she ruled with masculine resolution for eight years. Besides taking part in the expedition to Barbary, Ottavio also fought for Charles, at the head of the Italian auxiliaries, against the Protestants of Germany. He was twenty-seven when, by the murder of his father, he became duke of Parma. Piacenza was held by the imperialist troops which had seized it; and the means to be used for its recovery became the subject of a quarrel between the pope and Ottavio, who was supported by his brother Cardinal Alessandro. In consequence, Paul commanded the governor of Parma, Camillo Orsino, to refuse admittance to his grandson. Ottavio retaliated by an unsuccessful attack upon Parma, and even appealed to his enemy the emperor for assistance. The death of Paul, hastened by vexation at this unnatural rebellion, quickly followed; and Julius III., under the influence of the two cardinals Farnese, restored Parma to Ottavio. His quarrel with the emperor, however, was not at an end; and in 1551, having formed an alliance with Henry II. of France, he was driven from his fiefs by the imperial party. But it was not long before the influence of his wife obtained his restoration. The rest of his life was spent peacefully at home, and the moderation of his government earned for him the affection of his people. He died in 1586, and was succeeded by his son, Alessandro Farnese, the great servant of Philip II., noticed separately below.

Ranuccio Farnese (1569-1622), born in 1569, was the son of the famous Alessandro Farnese, prince of Parma, under whom he served for some time in the Low Countries. His gloomy pride and his avarice rendered him unpopular, and his suspicious temper led him into several acts of atrocious cruelty. On the birth of a legitimate heir, he placed his bastard son, whom he had formerly intended to make his successor, in strict confinement, in which the young man soon died; and on the charge of being implicated in a conspiracy, in the real existence of which few believed, he beheaded several of his nobles, confiscated their estates, and hanged numbers of their retainers. He had, however, some taste for art; and he built a fine theatre at Parma on the model of the ancient Roman theatres. He died in 1622. His son Odoardo (1612–46) fought in alliance with France against Spain. His failure to pay the interest of the money he had borrowed at Rome, and the desire of the pope to obtain the duchy of Castro for his relatives, the Barberini, gave rise to a war with Urban VIII. Odoardo's successor, Ranuccio, was also engaged in war with the Holy See; and, during his reign, Innocent, taking advantage of his weakness, and using as pretext the murder of the bishop of Castro, razed that town.

In 1731 the male line of Farnese became extinct by the death of Antonio Farnese. But Antonio's daughter, Elizabeth Farnese (noticed below), was the queen of Philip V. of Spain, and through her efforts her sons succeeded to the Farnese fiefs, the duchy of Castro being secured to Don Philippo by the treaty of Aix-la-Chapelle (1748), and the rest falling to the share of Don Carlos (at that time king of Naples and Sicily, afterwards king of Spain), together with the splendid family property in Rome—the Palazzo Farnese and the Farnese gardens. A large part of the Farnese art collection—including the Hercules, the

Bull, and the Flora—was removed to the museum at Naples. The Neapolitan court resided in the Farnese palace for many years. In 1861 the Farnese gardens, which belonged to the pope, and had been held in fee by the king of Naples, were bought by Napoleon III. from Francis II. for 250,000 francs, and they now belong to the Italian Government, which bought them in 1870 for 650,000 francs. See Rome.

FARNESE, Alexander, Pope Paul III. See Paul III.

FARNESE, Alexander (1546-1592), prince of Parma, the famous governor of the Low Countries, was born most probably about 1546. He was the son of Ottavio Farnese, prince of Parma, and the celebrated Margaret of Austria, natural daughter of Charles V. His boyhood he spent at Alcala and Madrid, having as companions his ill-fated cousin Don Carlos and his uncle Don John of Austria, who were both about the same age as himself. His chief delight was in martial exercises, and his passionate ambition was for warlike glory. At eleven years of age he earnestly begged leave to join the expedition which fought at St. Quentin, and wept bitterly when his request was refused. He had, indeed, a love for fighting for its own sake. During the wearisome inactivity of his residence at Brussels with his mother, whose abilities and masculine force of character had led to her appointment as governor of the Low Countries, it was his nightly amusement to saunter in disguise through the streets and challenge any cavalier of martial appearance whom he met. As a young man he was extremely unpopular among the Netherlanders; men said that he was nothing but a coxcomb and a bravo. He treated even the nobility with the most insolent arrogance. When he honored them with an invitation to dinner, he sat for the most part silent at the head of the table, and placed his guests below the salt. During his stay at Brussels, on the 18th November, 1565, his marriage with that wonderful paragon of propriety, Donna Maria of Portugal, was celebrated with great splendor and at prodigious expense.

At length, after years of impatient waiting, his passionate longing for military glory could no longer be repressed, and in 1571 he gained his first laurels by brilliant personal bravery in the battle of Lepanto. It was seven years before he had an opportunity of proving his splendid ability as a general. In the end of 1577 he was placed in command of the reinforcements sent to Don John, and it was mainly his prompt decision at a critical moment which secured the victory of Gemblours (1578). His abilities were now recognized by his master Philip II., and on the death of Don John, he was appointed governor of the Netherlands.

This position, beset on every hand with difficulties apparently insuperable, was exactly that which afforded the best opportunity for the display of his remarkable talents and character. He gave his whole heart to his work, never questioning the justice of the cause. Birth and education had endowed him with the soul of a prince, with its virtues and its faults; and it probably never occurred to him to doubt that the world was created as a field for the ambition of princes, or to imagine that the plain Netherland burghers, who certainly did not display a very satisfactory capacity for ruling themselves in the crisis of national danger, were, with all their failings, really fighting for a noble cause. To him they were self-willed rebels and heretics. In military ability Alexander Farnese was not surpassed, if equalled, by any of his contemporaries. He possessed in a very high degree the power of command; his ill-fed, ill-clad, unpaid soldiers rendered him the most perfect obedience. A consummate master of strategy, fertile in resource, prompt and vigorous in action, partly by the power of his genius and partly by the contagion of his dauntless courage, he performed the greatest achievements with the slenderest means. His coolness in danger amounted to rashness. Once, while dining within range of the enemy, a shot scattered the brains of one of his companions on the table, but he ordered a new cloth to be laid, and would not give the enemy the satisfaction of interfering with his arrangements. His skill in diplomacy was second only to his generalship, but it was a diplomacy without scruple, and his dissimulation was remarkable even in that age. Yet though jealousy preferred numerous charges against him, there is no reason to doubt his fidelity to his ungrateful master.

He found the Netherlands distracted by petty jealousies and party quarrels, and to take advantage of these all his skill in diplomacy and in the art of delicate bribery was exerted to the utmost. In the magistracies of many of the towns he created a party favorable to the king, and the Walloon provinces were induced to return to their allegiance. But he was unable to prevent the Union of Utrecht, which was formed in 1579 by the genius of William the Silent. For five years he waged equal war with that great prince, his chief exploits being the taking of Maestricht and Oudenarde. In 1584 William was assassinated. The opportunity was not lost by Farnese. He offered most favorable terms (except as regarded the matter of religion), and gained over Ghent and several other important towns. But the great town of Antwerp remained faithful to the union, and against it all his energies were now directed. The history of this siege may be taken as best displaying all the many and varied qualities of a great general which Alexander Farnese possessed. Antwerp enjoyed a natural means of defence, of which William of Orange had resolved to take advantage, and which would have enabled it to bid defiance even to the genius of Farnese. It was possible by breaking down the dykes to flood the country to the very city gates. Sainte Aldegonde, the governor, persuaded the magistracy to adopt this plan; but the butchers and others, whose private interests were threatened, offered a violent resistance, and the magistrates yielded in fear of riots. Another chance was afforded Antwerp, and the magistrates were again to blame, with far less excuse. Even after the siege commenced, numerous ships continued to bring grain into the city, which might easily have been stored with supplies for a very long period; but the magistrates fixed a minimum price, and decreed that no corn should be sold to merchants for storing in granaries, thus completely stopping the invaluable traffic. They did not for a moment believe that Farnese would be able to overcome the many difficulties of the task, and build a bridge across the Scheldt. But his engineering skill soon showed itself equal to the achievement; and it was now in his power to starve the town. Yet a third chance was allowed to Antwerp. The ingenious fireships of Gianibelli were launched against the bridge; a breach was effected; a thousand Spanish soldiers were destroyed; Farnese himself was wounded and lay senseless for some time; his army was overwhelmed with panic. The ships of the Netherlands might have brought their cargoes of corn into the town, and a fatal blow might have been struck against the Spaniards. But, through gross incompetence, the Netherlanders only learned their success too late. The moment he recovered consciousness, Farnese had set about repairing the bridge, inspiring his panic-stricken followers with his own undaunted resolution and energy, and careful precautions were taken against the recurrence of such a disaster. The only hope of Antwerp was to break down the dykes, and, taking advantage of Farnese's absence, Sainte Aldegonde collected for the work a strong and resolute force. A fierce hand-to-hand fight ensued on the slippery dykes, and the work was going slowly forward, while the Spaniards were beginning to give way, when Farnese himself appeared on the scene, and by his own exploits, and the inspiration of his presence, entirely changed the fortunes of the day. The Netherlanders fought resolutely for their homes and liberties, but at last were forced to retreat, leaving the breach unmade. Antwerp was soon obliged by famine to capitulate; Farnese, who was ignorant of the extremity of their distress, allowing a complete and universal amnesty, and only requiring that all Protestants should leave the city within two years. There was one noteworthy condition, cunningly worded and worthy of Italian diplomacy: it was provided that during the two years allowed the Protestants should not offer "any offence" to the ancient religion. The Catholic magistrates whom Farnese had appointed, and the Spanish garrison which held the citadel he had rebuilt, were, of course, the sole judges of what constituted such an offence.

The year 1586 he employed in taking steps to obtain the command of the Meuse and Rhine. Grave, Gelders, and Deventer he gained by bribery and intrigue, and Neuss, by assault. In this year negotiations were opened with Elizabeth, who had sent an army under Leicester into the Low Countries. These negotiations are the most striking illustration of Parma's principles of diplomacy. So perfect was his apparent frankness that even Elizabeth and Burleigh, who were well accustomed to double-dealing, appear to have been completely deceived. From the first Farnese had been told by his master that the negotiations were to lead to nothing; and at the very moment when he had just received orders to invade England, he was assuring the queen that "really and truly" nothing was intended against her majesty or her kingdom.

As time went on, Parma's position grew more and more difficult. His soldiers died in hundreds from cold, hunger, and disease; money was doled out to him with the most niggardly hand; and it required all his influence to keep down mutiny. He was constantly harassed by Philip's commands to attempt the impossible. He had prepared a fleet of transport boats, and the king issued repeated orders that he should with these invade England, though every port was blockaded by the ships of Holland and Zealand. Once, goaded to rashness, he made a mad attempt to break through the line, but the odds were too great, and he was repulsed with heavy loss. Even after the failure of the Armada, Philip still thought that Farnese with his unarmed boats should do that which the huge warships had failed to accomplish.

In 1590 the condition of the Spanish troops had become intolerable. Farnese could no longer support them from his private resources; his very jewels were pledged, and the supplies from the king did not increase in regularity or amount. A mutiny broke out but was speedily suppressed. Under these difficulties, Farnese was commanded to leave the work of years, and raise the siege of Paris, which was surrounded by Henry of Navarre. He left the Netherlands on the 3d August, 1590, with 15,000 troops. At Meaux he swore publicly in the cathedral that he had come, not to conquer France, but only to assist the Catholic cause. By the most splendid strategy he outwitted Henry, and relieved Paris; but his troops being insufficiently supplied, he was compelled immediately to return to the Low Countries, losing on the march many stragglers and wounded, who were killed by the peasantry, and leaving all the positions he had taken to be recaptured by Henry.

Again, in 1591, in the very midst of a desperate contest with the genius of Prince Maurice, sorely against his will, Farnese was obliged to give up the engrossing struggle and march to relieve Rouen. Henry at once cautiously raised the siege. In a subsequent engagement Farnese was wounded by a musket-ball in the arm. Yet he defied pain and fever, refused to take the necessary rest, and was carried in his couch to the field. At length Henry seemed to have shut in the Spanish army safely in the land of Caux, but Farnese found means to escape across the Seine. He spent a few days in Paris, and then visited Spa to drink the waters.

All his splendid services had not gained for him the confidence of Philip. His enemies persuaded the king that he was only striving to conquer the Netherlands that he might obtain the sovereignty for himself. Philip's first characteristic step was to despatch a letter expressing complete confidence and tender affection; Farnese was then politely requested to return home to aid his majesty with his advice. But at the same time the marquis of Cerralbo was sent to the Netherlands to share his work with the Mansfelds, and with orders to send him home by force, if he refused to obey the king's deceitful command. But all trouble was spared the grateful monarch. In the autumn of 1592 Alexander Farnese prepared to invade France for the third time. His robust constitution ruined by the prodigious labors he had performed, gouty, dropsical, fevered with his wounds, he was lifted into his saddle every day till the very morning of his death. On the 3d December, 1592, in the town of Arras, he fainted while undressing for bed, and in a few hours was dead. He was only forty-six years of age. By his own command he was laid out in the garb of a Capuchin friar. His services were rewarded by a pompous funeral at Brussels, at which his Italian and Spanish veterans fought together for the first place among the mourners, and his statue was placed in the Capitol at Rome. He was buried in the church of his own capital of Parma.

See Strada, the historiographer of the Farnese family; Motley, *Dutch Republic and United Netherlands;* Gachard, *Correspondance de Philippe II.*

FARNESE, Elizabeth (1692–1766), queen of Spain, born on the 25th October, 1692, was the only daughter of Odoardo II., prince of Parma. Her mother educated her in strict seclusion, but seclusion altogether failed to tame her imperious and ambitious temper. At the age of twenty-one (1714) she was married by proxy at Parma to Philip V. of Spain. The marriage was arranged by the Italian cardinal Alberoni, with the concurrence, it is said, of the king's mistress, the Princess Orsino. On her arrival at the borders of Spain Elizabeth was met by the princess; but she received her rival sternly, and, perhaps in accordance with a plan previously concerted with the king, at once ordered her to be removed from her presence and from Spain. Over the weak king Elizabeth quickly obtained complete influence. This influence was exerted altogether in support of the policy of her countryman Alberoni, one chief aim of which was to recover the ancient Italian possessions of Spain, and which actually resulted in the seizure of Sardinia and Sicily. So vigorously did she enter into this policy that, when the French forces advanced to the Pyrenees, she placed herself at the head of one division of the Spanish army. But Elizabeth's ambition was grievously disappointed. The Triple Alliance thwarted her plans, and at length in 1720 the allies made the banishment of Alberoni a condition of peace. Sicily also had to be evacuated. And finally, all her entreaties failed to prevent the abdication of Philip, who in 1724 gave up the throne to his heir, and retired to the palace of La Granja. Seven months later, however, the death of the young king recalled him to the throne. In 1736 Elizabeth had the satisfaction of seeing her favorite scheme realized in the accession of her son Don Carlos (afterwards Charles VI.) to the throne of the Two Sicilies and his recognition by the Powers in the Treaty of Vienna. Elizabeth survived her husband twenty years, dying in 1766.

See Philip V. of Spain; Spain; *Mémoires pour servir à l'histoire d'Espagne sous le règne de Philippe V.*, by the Marquis de St. Philippe, translated by Maudave, Paris, 1756; *Memoirs of Elizabeth Farnese*, London, 1746.

FARNHAM, a market-town of England, county of Surrey, near the left bank of the Wey, 10 miles W.S.W. of Guildford, and 40 miles from London by rail. It is built on the southern slope of a hill rising about 700 feet above the level of the sea, and consists principally of two main streets, with a market-place at their intersection. It is well supplied with water from springs in the neighboring hills, conveyed by pipes to a large reservoir in the town. Farnham was formerly noted for its cloth manufacture, which is now quite extinct. It is chiefly celebrated for the hops of a very superior quality cultivated in the vicinity. The parish church is a spacious edifice in the later Gothic style, and was formerly a chapel of ease to Waverley Abbey (founded in 1128), of which some remains still exist in the vicinity. A fine new town-hall, in the Italian style of architecture, was erected in 1866. Population (1871), 4461.

Farnham was early a place of importance, and sent two members to parliament from 4th Edward II. to 38th Henry VI. Farnham Castle, on a hill north of the town, now the seat of the bishop of Winchester, was first built by Henry de Blois, bishop of Winchester, and brother of King Stephen; but it was razed by Henry III. It was rebuilt and garrisoned for Charles I. by Denham, from whom it was taken in 1642 by Sir W. Waller; and having been dismantled, it was restored by Dr. Morley, bishop of Winchester. Cobbett was born in the parish of Farnham, and his remains are interred near the main entrance of the church.

FARO, a city and seaport of Portugal, chief town of the province of Algarve, is situated on the Rio Fermoso, near its mouth, 20 miles W. by S. of Tavira. It is surrounded by walls, and contains a cathedral, a military hospital, a custom-house, an arsenal, and several convents and charitable establishments. At the eastern end of the town is an old castle surrounded by Moorish fortifications. The harbor is small, but it has a good roadstead. The exports are figs, raisins, almonds, dates, oranges, lemons, wines, cork, sumach, baskets, and anchovies. Faro was burned by the English in 1596, and was partly destroyed by an earthquake in 1755. The population is about 8000.

FAROE ISLANDS, or Feroe Islands (Danish, *Färöerne*), a group in the North Sea belonging to Denmark. They are situated between Iceland and the Shetland Islands, about 200 miles N.W. of the latter, between 61° 20′ and 62° 25′ N. lat., and between 6° 16′ and 7° 40′ W. long. The total area of the group is 510 square miles, and that of the seventeen inhabited islands 490. The population in 1850 amounted to 9150, in 1860 to 8922, and in 1874 to

10,500. The principal islands are Strömö with 2400 inhabitants, Osterö 2067, Süderö 1387, Vaagö 702, Sandö 618, and Bordö 358. They consist throughout of rocks and hills, separated from each other by narrow valleys or ravines; but though the hills rise abruptly, there are often on their summits, or at different stages of their ascent, plains of considerable magnitude. They everywhere present to the sea perpendicular cliffs, broken into a thousand fantastic forms, affording at every turn, to those who sail along the coast, the most picturesque and varied scenery. The highest peaks are Slattaretind in Osterö, and Skellingfjeld, Skalingfield, or Ben Scarling in Strömö, which, according to barometric measurement, rise respectively to about 2890 and 2506 feet above the sea. The rocks are generally trap, and exhibit little variety of composition, though they present some striking geological phenomena. The zeolites and chalcedonies of the Faroes have long supplied the best specimens to the cabinets of Europe. Turf is abundant. Coal is found in Süderö and some of the other islands in sufficient quantity to make it a matter of exploitation. In 1872 an expedition was sent out by the United Steamship Company (*forenede Dampskibselskab*) to investigate the geology of the coal-fields, and in 1876 works were commenced at Trangisvaag and Frodebo.

The climate is foggy, and violent storms are frequent at all seasons. July and August are the only true summer months, but the winters are not very severe. It seldom freezes for more than one month, and the harbors are rarely ice-bound. The only grain crop is barley; and on account of the uncertainty of the weather, it is frequently reaped in a half-ripe condition. Agriculture is in a very backward state, the infield or cultivated land being calculated to be to the outfield or uncultivated in the proportion of one to sixty. As the plough is ill-suited to the rugged and uneven surface of the land, the ground is usually turned up with the spade, care being taken not to destroy the roots of the grass. Horses and cows are few in number, and the latter give very little milk, in consequence probably of the very coarse hay upon which they are fed. Sheep form the chief riches of the islanders, some individuals having flocks of from three to five hundred, and the total number in the islands being about 80,000. They are never housed either in summer or winter, and in severe seasons they suffer considerably. The wool is generally coarse, and is torn off the animals in so rough a manner as often to lacerate the skin. The northern hare (*Lepus alpinus*) is pretty abundant in Strömö and Osterö, having been introduced into the islands about 1840-50. Besides the ordinary Norway rat there still exist some few representatives of the older black rat (*Mus rattus*), and, according to popular accounts, a third species not yet scientifically identified. The catching of the numerous sea-birds which build their nests upon the face of the cliffs forms an important source of subsistence to the inhabitants. Sometimes the fowler is let down from the top of the cliff; at other times he climbs the rocks, or, where that is possible, is pushed upwards by poles made for the purpose. The puffin (*Alca arctica*) is the commonest species, and the eider duck is frequently shot for food. The cod fishery is especially important,—the dried fish being exported to Spain and France, the swim-bladders made into gelatine, and the ovaries prepared for the anchovy fisher of the Mediterranean. Several Salmonidæ are found in the streams and lakes,—among them the charr (*Salmo salvelinus*), which occurs in Upper Bavaria and Scotland. According to Mörch, there are 13 species of land and fresh-water mollusks, but not one of them is peculiar to the islands.

The trade of the Faroe Islands was for some time a monopoly in the hands of a mercantile house at Copenhagen, and this monopoly was afterwards assumed by the Danish Government, but by the law of March 21, 1855, all restrictions were removed. Hosiery, tallow, dried and salt fish, train-oil, feathers, skins, and butter are the chief exports. Thorshavn, the chief town of the islands, is situated on the S.E. side of Strömö, upon a narrow tongue of land, having creeks on each side, where ships may be safely moored. Its population is only between 500 and 600; but it is the seat of the chief Government and ecclesiastical officials, and has a castle, a hospital, and a library. The houses are built of wood and roofed with birch bark covered with turf, the greenness of which makes it impossible at a very short distance to distinguish the place from the surrounding fields. The character of the people is generally marked by great simplicity of manners, kindness, and hospitality. They are well fed and clothed, and seem to be kindly treated by the Danish Government. The average duration of life, as stated by Dr. Panum, is 44⅔ years, while in Denmark it is only 36.

The Faroe Islands were, it would appear, first colonized by a certain Grim Kamban in the time of Harold Haarfager; and Christianity was introduced by Sigmund Bresterson at the command of Olaf Tryggvason. They are said to derive their present name from the number of sheep (*faar*); in the Middle Ages they were known by the name of Friesland, which was corrupted by the Arabian geographers into Reslanda. English adventurers gave great trouble to the inhabitants in the 16th century, and the name of Magnus Heiresen, a native of Strömö, who was sent by Frederick II. to clear the seas, is still celebrated in many a song and story. There was formerly a bishopric at Kirkebo, but it was abolished at the introduction of Protestantism by Christian III., and the islands are now ecclesiastically dependent on the bishopric of Zealand. The kingdom of Denmark retained possession of the Faroes at the peace of Kiel in 1815, though they had originally belonged to Norway. The language of the people is a remnant of the Old Norse, but that of the courts, churches, and schools is the modern Danish. The statement that there is no native literature is a mistake: not to speak of the famous *Færeyinga Saga*, which was published by Rufn and Mohnike at Copenhagen in 1833, the botanist, H. C. Lyngbye, who visited the islands for the study of their Algæ, brought back and published in 1822 a number of the popular songs about Sigurd, and a new treatment of the same theme appeared at Paderborn in 1877.

FARQUHAR, GEORGE (1678-1707), a dramatist of the last century, the successor in comedy of Wycherley and Congreve, was the son of a clergyman, and was born in Londonderry, Ireland, in the year 1678. In his sixteenth year he was sent to Trinity College, Dublin, under the patronage of the bishop of Dromore. He was entered as a sizer or servitor, a class of poor scholars, who were compelled to wear a peculiar dress and perform menial offices. These are no longer exacted from their successors, but Goldsmith, sixty years after the date of Farquhar's admission, had to submit to the humiliations incident to the position of a sizer—to sweep part of the college courts, to carry up the fellows' dinner to table, and to wait in the hall till the fellows had dined. It certainly implied a contradiction, as Goldsmith observed, for men to be "at once learning the liberal arts, and at the same time treated as slaves," and neither in the case of Farquhar nor of Goldsmith was the system attended with favorable results. The former soon broke away from his studies, and appeared as an actor on the Dublin stage. He had the advantage of a good person, though with a weak voice, but was timid and sensitive, and an accident which happened to him when he had only been about a twelvemonth on the boards made him resolve to quit the profession. When performing the part of Guyomar in Dryden's *Indian Emperor* he had omitted to exchange his sword for a foil, and in a fencing scene wounded a brother performer so severely that his life was despaired of. The sufferer recovered, but Farquhar would never again return to the stage. The earl of Orrery gave him a lieutenancy in his regiment then in Ireland, and as a soldier Farquhar is said to have given proofs of his courage and conduct, though none are recorded. We have two letters written by him in Holland in 1700, but in these he says nothing of military service. While yet a minor he appeared as a dramatist. His comedy of *Love and a Bottle* was performed at Drury Lane in 1698, and its success far exceeded his expectations. His next comedy, *The Constant Couple* (1700), was still more favorably received. Wilks, a popular comedian and a special friend of Farquhar's (they had been associates in Dublin), by his performance of the part of Sir Harry Wildair contributed very much to the success of the play. "He *made* the part," says Farquhar. In the following year the dramatist brought out a sequel to it, entitled *Sir Harry Wildair*. Wilks's acting was again attractive, but like all continuations (that of Don Quixote excepted) the second part was much inferior to the first. Leigh Hunt has stated that Mrs. Oldfield, like Wilks, performed to admiration in this piece, but Mrs. Oldfield was not the original heroine (Lady Lurewell). The part was acted by Mrs. Verbruggen. Mrs. Oldfield performed in the two last and best of Farquhar's seven comedies, and is said to have taken to the stage by his advice. She was the theatrical idol—the Mrs. Jordan—of her day. Her exquisite acting and lady-like carriage were the delight of her contemporaries, and her beauty, her vanity, and her generosity found innumerable eulogists—

> "Engaging Oldfield, who, with grace and ease,
> Could join the arts to ruin and to please."[1]

In 1702 Farquhar published a trifling volume of *Miscellanies*—poems, letters, and a discourse on comedy. The poems are below mediocrity, and the letters are written in that overstrained style of gallantry and smartness which was then fashionable and considered witty. In one letter he gives a lady a picture of himself "drawn from the life." His mind, he says, was generally dressed, like his person, in black; he was taken for an easy-natured man by his own sex, and an ill-natured clown by the ladies; strangers had a worse opinion of him than he deserved, but this was recompensed by the opinion of his acquaintance, which was above his desert. Self-portraiture is seldom faithful, but we may conclude from Farquhar's outline, that the young dramatist was somewhat grave and reserved, and wanted address for general society. He was liveliest with the pen in his hand. The discourse on comedy is more worthy of the author than his poems or letters. In it he defends the English disregard of the dramatic unities. "The rules of English comedy," he says, "don't lie in the compass of Aristotle or his followers, but in the pit, box, and galleries." In 1703 Farquhar had another comedy on the stage—*The Inconstant, or the way to win him*—the *hint* of which he says, he took from Fletcher's *Wild Goose Chase*, but was charged with spoiling the original. The poetry of Fletcher certainly evaporates when its scenes are transmuted into the prose dialogue of Farquhar.

About this time the dramatist was betrayed into what was perhaps the greatest blunder of his life. A lady conceived a violent passion for him, and, though penniless like himself, contrived to circulate a report that she was possessed of a large fortune. Farquhar snapped at the gilded bait. He married the lady, and found too late that he had been deceived. It is related, however, that he had the magnanimity to pardon a deception which must have appeared a compliment to his genius, and in truth there was something to forgive on his own part for having been so readily entrapped contrary to all the rules of love and the drama. Increased exertion, however, was necessary, and in 1704 he produced *The Stage Coach*, a piece adapted from the French by Farquhar in conjunction with Anthony Motteux, a clever, reckless playwright and essayist, and remarkable as having, though a Frenchman, given the world the best English translation of Don Quixote. Three more comedies proceeded from Farquhar before his career was sadly closed at the age of thirty. *The Twin Rivals* was brought out in 1705, *The Recruiting Officer* in 1706, and *The Beaux Stratagem* in 1707. The last two are vastly superior to Farquhar's other plays, and are the works by which he is now remembered. To relieve the poor dramatist from his difficulties, increased by his ill-starred marriage, the duke of Ormond is said to have advised him to sell his commission in the army and pay his debts, his grace promising at the same time to give him a captaincy in his own regiment. Farquhar sold his commission, but the duke either forgot or was unable to fulfil his promise. Farquhar's earliest biographer ascribes the unfortunate counsel to a "certain great courtier," who made solemn assurance which he forgot to keep. *The Beaux Stratagem* was written in six weeks, while death was impending over its author. Before he had finished the second act he knew that he was stricken with a mortal illness, but it was necessary to persevere and to be "consumedly lively" to the end. He had received in advance £30 for the copyright from Lintot the bookseller. The play was brought on the stage March 8, and Farquhar lived to have his third night, and an extra benefit on the 29th of April, on which day he is said to have died. He left his two children to the care of his friend Wilks:—"Dear Bob, I have nothing to leave thee to perpetuate my memory but two helpless girls. Look upon them sometimes and think of him that was to the last moment of his life thine, GEORGE FARQUHAR." Wilks obtained a benefit at the theatre for the dramatist's widow, and the daughters had a pension of £30 a year, which one of them was in receipt of so late as 1764. The plots of Farquhar's comedies are skilfully conducted and evolved; his situations are well chosen (in these his friend Wilks's advice would be useful), and his dialogues are full of life and spirit. To the polished wit and brilliancy of Congreve he has no pretension. His scenes are light and sketchy, and his characters altogether on a lower level than Congreve's, but they were quite equal to them in stage effect. Sergeant Kite, Scrub, Archer, and Boniface are distinct original characters which long charmed on the stage, while the incidents with which they are mixed up—the unexpected encounters, adventures, artifices, and disguises—are irresistibly comic and attractive in representation. Pope considered Farquhar a mere farce writer, while Goldsmith (who evidently adopted him as a model) preferred him to Congreve. On the stage, with good actors, he might be so preferred, but never in the library. He had the advantage of being less designedly and elaborately licentious than Congreve. Love intrigues then formed the chief business of the comic drama; and in the management of them the homely domestic virtues that form the happiness and cement of society were disregarded or made the subject of ridicule. It is true that the world of comedy was, as argued by Charles Lamb, an artificial world, never perhaps regarded as real or as supplying patterns of morals or manners, but the effect of such representations was to lower and corrupt the national taste, while the fact that no pursuit was then so profitable to an author as writing for the stage was also injurious to our imaginative literature. On this moral view of the question, the reasoning of Macaulay and the eloquent objurgation of Thackeray are unanswerable.[2] The artificial comedy, or comedy of manners, as seen in the beginning of the last century, is now "quite extinct on our stage," as Leigh Hunt has observed; but Hunt is surely in error in dating the decline of English comedy from the time of Farquhar. To say nothing of Goldsmith's two plays, Sheridan's *Rivals* and *School for Scandal* show no declension in brilliancy of dialogue, wit, or vivacity, and some of the plays of Cumberland and the Colmans evince high dramatic talent. (R. CA.)

FARRAGUT, DAVID GLASCOE (1801–1870), first admiral of the United States navy, was the son of Major George Farragut, a Catalan by descent, a Minorquin by birth, who had emigrated to America in 1776, and, after the peace, had married a lady of Scotch family and settled near Knoxville, in Tennessee; there Farragut was born on the 5th July, 1801. At the early age of nine he entered the navy, under the protection of his name-father, Captain David Porter, with whom he served in the "Essex" during her cruise in the Atlantic in 1812, and afterwards in the Pacific, until her capture by the "Phœbe," in Valparaiso Bay, on the 28th March, 1814. He afterwards served on board the "Washington," 74, carrying the broad pennant of Commodore Chauncey in the Mediterranean, and pursued his professional and other studies under the instruction of the chaplain, Mr. Folsom, with whom he contracted a life-long friendship. Folsom was appointed from the "Washington" as U. S. consul at Tunis, and obtained leave for his pupil to pay him a lengthened visit, in the course of which he acquired a familiar knowledge of Arabic and Turkish. Farragut is said, in his later years, to have spoken fluently all the principal European languages; this is probably an exaggeration, but with an hereditary knowledge of Spanish, he may have picked up some French and Italian at this time; until the very end of his career, it was his only visit to European waters. In 1825 he was promoted to the rank of lieutenant, whilst serving in the navy yard at Norfolk, where he continued till 1832; he then served for a commission on the coast of Brazil, and was again appointed to the yard at Norfolk. It is needless to trace the ordinary routine of his service step by step. The officers of the U. S. navy have one great advantage which is wanting to our own; when on shore they are not necessarily parted from the service, but are employed in their several ranks in the different dockyards, escaping thus not only the private grievance and pecuniary difficulties of a very narrow half-pay, but also, what from a public point of view is much more important, the loss of professional aptitude, and of that skill which comes from unceasing practice. On the 8th September, 1841, Farragut was promoted to the rank of commander, and on the 14th September, 1855, to that of captain. At this time he was in charge of the navy yard, Mare Island, California, from which post he was recalled in 1858, and appointed to the "Brooklyn" frigate, the command of which he held for the next two years. When the war of secession broke out in 1861, he was "waiting orders" at Norfolk. By birth and marriage he was a Southerner, and the citizens of Norfolk counted on his throwing in his lot with them; but professional pride, and affection for the flag under which he had served for more than fifty years, held him true to his allegiance: he passionately rejected the proposals of his fellow-townsmen, and as it was more than hinted to him that his longer stay in Norfolk might be dangerous, he hastily quitted that place, and offered his services to the Government at Washington. These were at once accepted; he was requested to sit on the Naval Retiring Board,—a board then specially constituted for clearing the navy of unfit or disloyal officers, —and a few months later was appointed to the command of the "Western Gulf Blockading Squadron," with the rank of flag-officer, and ordered to proceed forthwith, in the "Hartford," to the Gulf of Mexico, to collect such vessels as could be spared from the blockade, to proceed up the Mississippi, to reduce the defences which guarded the approaches to New Orleans, and to take and hold the city. All this Farragut executed to the letter, with a skill and caution that won for him the love of his followers, and with a dash and boldness that won for him the admiration of the public, and the popular name of "Old Salamander." The passage of the Mississippi was forced on the 24th April, 1862, and New Orleans surrendered on the 26th; this was immediately followed by the operations against Vicksburg, from which, however, Farragut was compelled to withdraw, having relearnt the old lesson that against heavy earthworks, crowning hills of sufficient height, a purely naval attack is unavailing: it was not till the following summer, and after a long siege, that Vicksburg surrendered to a land force under General Grant. During this time the service on the Mississippi continued both difficult and irksome; nor until the river was cleared could Farragut seriously plan operations against Mobile, a port to which the fall of New Orleans had given increased importance. Even then he was long delayed by the want of monitors with which to oppose the ironclad vessels of the enemy. It was the end of July, 1864, before he was joined by these monitors; and on the 5th August, undismayed by the loss of his leading ship, the monitor "Tecumseh," sunk by a torpedo, he forced the passage into the bay, destroyed or captured the enemy's ships, including the ram "Tennessee," bearing Admiral Buchanan's flag, and took possession of the forts. The town was not occupied till the following April, but with the loss of its harbor it ceased to have any political or strategical importance. With this Farragut's active service came to an end; for though in September, 1864, he was offered the command of the force intended for the reduction of Wilmington, the state of his health, after the labors and anxieties of the past three years, in a trying climate, compelled him to decline it and to ask to be recalled. He accordingly returned to New York in December, and was received with the wildest display of popular enthusiasm. It was then that the Government instituted the rank of vice-admiral, previously unknown in the American service. Farragut was promoted to it, and in July, 1866, was further promoted to the rank of admiral. In 1867, with his flag flying in the "Franklin," he visited Europe. The appointment was an honorable distinction without political or naval import: the "Franklin" was, to all intents, for the time being, a yacht at Farragut's disposal; and her arrival in the different ports was the signal for international courtesies, entertainments, and social gayety. She returned to America in 1868, and Farragut retired into private life. Two years later, on the 14th August, 1870, he died at Portsmouth, New Hampshire.

---

[1] Pope—*Sober Advice from Horace*. It was to this fascinating actress that the satirist alluded as the lady who detested being buried in woollen, and said to her attendant—

> "One would not sure be frightful when one's dead—
> And—Betty—give this cheek a little red."

She was only forty-seven when she died, leaving all the court and half the town in tears.

[2] See Macaulay's essay on the Comic Dramatists of the Reformation, and Thackeray's *English Humorists*. In 1840, Leigh Hunt published biographical and critical notices of Wycherley, Congreve, Vanbrugh, and Farquhar, prefixed to an edition of their dramatic works—a valuable addition to our dramatic literature.

No biography of Farragut, at all fitting his great reputation, has yet appeared; the only one that can be mentioned, *Life and Naval Career of Vice-Admiral Farragut*, by the Rev. P. C. Headley (1865), notwithstanding its claim to be based on personal information, is a badly-written boys' story-book, overloaded with childish and irrelevant matter. A better account of his more distinguished services is to be found in Putnam's *Rebellion Record* (1864–68) or Boynton's *History of the Navy during the Rebellion* (1867). (J. K. L.)

FARRAKHÁBÁD [Furruckábád], a district of British India, in the Agra division, and under the jurisdiction of the lieutenant-governor of the North-Western Provinces, lies between 26° 45′ 45″ and 27° 42′ 45″ N. lat., and 79° 10′ 45″ and 80° 6′ 0″ E. long. It is bounded on the N. by Budáon and Sháhjahánpur, E. by Harduí, S. by Cawnpur and Etáwah, and W. by Máinpurí and Etah. The district is a flat alluvial plain in the middle *duáb*. The principal rivers are—the Ganges, which has a course of 87 miles either bordering on or passing through the district, but is not at all times navigable by large boats throughout its entire course; the Budh Gangá, which enters the district in its north-west corner, and falls into the Ganges opposite the town of Farrakhábád, after a course of 45 miles; the Kálí-nadí (84 miles), and the Isán-nadí (42 miles), both tributaries of the Ganges; and the Arind-nadí, which, after a course of 20 miles in the south of the district, passes into Cawnpur. The census of 1872 returned the population at 499,722 males and 419,026 females,—total, 918,748, of whom 816,733 were Hindus, 101,538 Mahometans, and 477 Christians. The area of the district is 1744 square miles, of which 1021 are returned as under cultivation, and 264 as cultivable, but not actually under tillage. The principal products are rice, wheat, barley, millets, pulses, cotton, sugar-cane, potatoes, etc. The grain crops, however, are insufficient for local wants, and grain is largely imported from Oudh and Rohilkhand. The district is, therefore, liable to famine, and it has been severely visited by this calamity five times during the present century—in 1803–4, 1815–16, 1825–26, 1837–38, and in 1868–69.

The civil station and principal town is Farrakhábád, situated on the right or west bank of the Ganges in 27° 24′ N. lat. and 79° 40′ E. long.; population, 65,441. The other towns are—Fathigarh (Futtehgurh or Futtygur), civil and military station on the Ganges, 3 miles east of Farrakhábád, population 13,439; Kanauj, on the right bank of the Kálí-nadí, 17,903; Káimganj, 10,323; Shámsábád, 8710; Allahganj, 6246; Chibramau, 5444. Kanauj is of great archæological interest as being the ancient Hindu capital of this part of India. The ruins of the ancient town cover an area of five square miles. The only municipality in the district is that of Farrakhábád-cum-Fathigarh, with a population of 78,880; municipal revenue in 1875, £8177, 10s.; expenditure, £766, 6s. The total revenue of the district in 1876 was £197,229; the expenditure on civil administration, £43,755. The regular police force consisted of 943 officers and men, maintained at a cost of £10,279. For the education of the people there were 320 Government and aided schools in the district, attended by 7507 pupils, and receiving state aid to the extent of £3416. For medical relief four charitable dispensaries are maintained, at which 789 indoor and 19,732 outdoor patients were treated in 1875. Farrakhábád is one of the healthiest districts in the *duáb*, but fevers are prevalent during August and September. The average annual mean temperature is almost 80°; the average annual rainfall, 29·4 inches.

Of the tract comprising the present district, the portion lying north of the Kálí-nadí was included within the *jagír* or fief of the Rohilla nawáb of Farrakhábád, while the country to the south of the river formed part of the territories of the vizír of Oudh. During the wars of the middle of the last century, the district frequently changed hands, at one time being held by the Rohillas, and at another by the nawáb vizír. In 1774, however, the latter, with the assistance of the English, completely defeated the Rohillas; and Farrakhábád, together with the whole of Rohilkhand, passed into his hands, and remained with him till 1801, when it was ceded to the East India Company. In 1804 the Marhattás, under Holkar, ravaged this tract, but were utterly routed by Lord Lake at the town of Farrakhábád. During the mutiny Farrakhábád shared the fate of other districts, and passed entirely out of our hands for a time. The native troops, who had for some time previously evinced a seditious spirit, finally broke into rebellion on the 18th June, 1857, and placed the titular nawáb of Farrakhábád on the throne. The English military residents took shelter in the fort, which they held until the 4th July, when, the fort being undermined, they endeavored to escape by the river. One boat succeeded in reaching Cawnpur, but only to fall into the hands of the Náná. Its occupants were made prisoners, and perished in the massacre of the 10th July. The other boat was stopped on its progress down the river, and all those in it were captured or killed, except four who escaped. The prisoners were conveyed back to Fathigarh, and murdered there by the nawáb on the 19th July. The rebels were defeated in several engagements, and on the 3d January, 1858, the English troops recaptured Fathigarh fort; but it was not till May that order was thoroughly re-established. Since then nothing has occurred to disturb the peace of the district.

FARRANT, RICHARD, composer of English church music, flourished during the 16th century. Very little is known about him. Fétis gives 1530 as the date of his birth, but on what authority does not appear. He became a gentleman of the Chapel Royal in the reign of Edward VI., but resigned his post in 1564, on being appointed master of the children of St. George's Chapel, Windsor. In this capacity he presented a play before the queen at Shrovetide, 1568, and again at Christmas of the same year, receiving on each occasion the sum of £6, 13s. 4d. In November, 1569, he was reinstated as gentleman of the Chapel Royal. It is stated by Hawkins (*History of Music*, vol. iii. 279) that Farrant was also one of the clerks and organists of St. George's Chapel, Windsor, and that he retained these posts till his death. Many of his compositions are printed in the collections of Barnard and Boyce. Among the most admired of them are a service in G minor, and the anthems "Call to remembrance" and "Hide not thou thy face." It is doubtful whether Farrant is entitled to the credit of the authorship of the beautiful anthem "Lord, for thy tender mercies' sake." No copy of the music under his name appeared in print till 1800, although it had been earlier attributed to him. Some writers have named John Hilton, and others Thomas Tallis, as the composer. From entries in the *Old Check Book of the Chapel Royal* (recently edited for the Camden Society by Dr. Rimbault) it appears that Farrant died, not in 1585, as Hawkins states, but on November 30, 1580 or 1581.

FARS, or FARSISTAN, a province of Persia, extending along the Persian Gulf, and conterminous with Khusistan, Irak, and Kirman. Like the provinces to the N. and S., it is divided in three parallel districts,—the Dushtistan Germsir or hot country, the Tengsir or land of the passes, and the Sirhud or cold country. Its mountain ranges run parallel with the coast-line, and inclose a great number of valleys, both longitudinal and transverse. In some of these are considerable lakes, as, for example, the lake of Shiraz, and the salt lake Bakhtagan, which is about 75 miles long, and receives the waters of the Polwar or Kur. Of the rivers which flow into the Persian Gulf, the most important are the Prestaf in the S. and the Sefid Rud in the N. The coast is for the most part steep and inaccessible, but there are harbors at Bushire, Bender Kongun, and Bender Kakhil. As the cultivation of the Dushtistan region depends entirely on the periodical rains, years of abundance alternate with years of dearth. Inland among the mountains there is a great deal of excellent pasture land, but most of it lies quite unemployed by the thinly scattered population. Grain of various kinds, dates, tobacco, cotton, and hemp are all grown to some extent, and are usually of excellent quality; wine is manufactured, and the silk-worm reared; and a certain amount of attention is given to the weaving of cottons, silks, woollens, and camel-hair fabrics. An account of the exports will be found under BUSHIRE, vol. iv. Shiraz is the capital, and Firusabad, Darabjird, and Bebahan are towns of some importance. Most of the villages are mere collections of mud-built huts, and present a very poverty-stricken appearance, in striking contrast to the splendor of the ancient cities of Shakpur, Pasargadæ, and Persepolis, which lie within the province. No satisfactory estimate of the population can be given.

FASANO, a town of Italy, in the circondario and province of Bari, 32 miles S. of Bari, and a little to the W. of the railway to Brindisi. It stands in a rich olive district, and has a good trade in the produce. During summer the plague of flies is such that the inhabitants retire to a hill in the neighborhood, called La Selva, where there is already a considerable suburb growing up. The ancient Egnatia stood in this vicinity. Population 14,800.

FASTI, plural of the adjective *fastus*, but more commonly used as a substantive, is derived, according to Varro, from *fas*, meaning what is binding, or allowable, by divine law, as opposed to *jus*, or human law. *Fasti dies* thus came to mean the days on which law business might be transacted (see Ovid, *Fasti*, i. 48) *sine piaculo*, thus corresponding to our own "lawful days." Originally the fasti were a kind of official year-book, or almanac, with dates and directions for religious ceremonies, court-days, market-days, divisions of the month, and the like. Festus Pompeius calls them *totius anni descriptio*. In later times they meant state records in general. The fasti, again, were of two distinct kinds—*kalendaria*, or *fasti kalendares*, subdivided into *urbani* and *rustici*, and next, *fasti magistrales*, or *historici*. Until 314 B.C. the lore of the *kalendaria* remained the exclusive and lucrative monopoly of the priesthood; but in that year Cn. Flavius, a pontifical secretary, introduced the custom of publishing in the forum tables containing the requisite information, besides brief references to victories, triumphs, prodigies, etc. These tables were also called fasti. Ovid's *Fasti* have been well described as "a poetical year-book" illustrating the fasti published by Julius Cæsar when he remodelled the Roman year. In the tables of Flavius, the letters F., N., N.P., F.P., Q. Rex C.F., C., EN., stood for *fastus, nefastus, nefastus priore* (in the first half of the day), *fastus priore, quando rex sacrorum comitiavit fastus, comitialis* and *intercisus*. The *dies intercisi* were partly *fasti* and partly *nefasti*. Upon the cultivators fewer feasts, sacrifices, ceremonies, and holidays were enjoined than on the inhabitants of cities; and the rustic fasti contained little more than the ceremonies of the kalends, nones, and ides, the fairs, signs of zodiac, increase and decrease of the days, the tutelary gods of each month, and certain directions for rustic labors to be performed each month. The *fasti magistrales* were concerned with the several feasts, and everything relating to the gods, religion, and the magistrates; to the emperors, their birthdays, offices, days consecrated to them, with feasts and ceremonies established in their honor, or for their prosperity. They came to be denominated *magni*, by way of distinction from the bare kalendar, or *fasti kalendares*. Of this class, the *fasti consulares*, for example, were a chronicle or register of time, in which the several years were denoted by the respective consuls, with the principal events which happened during their consulates. A famous specimen of the same class are the *fasti Capitolini*, so called because they were deposited in the Capitol by Alexander Farnese, after their excavation from the Roman forum in 1547. They are chiefly a nominal list of statesmen, victories, triumphs, etc., from the expulsion of the kings to the death of Augustus. A considerable number of fasti of the first class have also been discovered; but none of them appear to be older than the time of Augustus. The Prænestine calendar, discovered in 1770, contains the months of January, March, April, and December, and a portion of February. The tablets give an account of festivals, as also of the triumphs of Augustus and Tiberius. But some kinds of fasti included under the second general head were, from the very beginning, written for publication. The *Annales Pontificum*—different from the *kalendaria* properly so called—were "annually exhibited in public on a white table, on which the memorable events of the year, with special mention of the prodigies, were set down in the briefest possible manner. Any one was allowed to copy them" (Teuffel's *History*). Like the pontifices, the augurs also had their books, *libri augurales*. In fact, all the state offices had their fasti corresponding in character to the consular fasti named above.

For details of *fasti* and their discovery, see the great work of Foggini, published at Rome in 1779. Watt's *Bibliotheca Britannica* contains a long list of references to authorities on the subject. See also Cruttwell's *History of Roman Literature*, 1877. An admirable summary on *fasti*, with numerous bibliographical references, is given in Teuffel's *Geschichte des Römischen Literatur*, 1870,—translated by Wagner under the title of *A History of Roman Literature*, 1873.

FASTING (*νηστεύειν*, *jejunare*) is most accurately defined as a withholding of meat, drink, and all natural food from the body for a determined period. So it is defined by the Church of England, in the 16th homily, on the authority of the Council of Chalcedon[1] and of the primitive church generally. In a looser sense the word is employed to denote abstinence from certain kinds of food merely; and this meaning, which in ordinary usage is probably the more prevalent, seems also to be at least tolerated by the Church of England when it speaks of "fast or abstinence days," as if fasting and abstinence were synonymous.[2] More vaguely still, the word is occasionally used as an equivalent for moral self-restraint generally. This secondary and metaphorical sense (*νηστεύειν κακότητος*) occurs in one of the fragments of Empedocles.

For the physiological aspects of the subject the reader may consult the article DIETETICS (vol. vii. pp. 183, 184).

Fasting is of special interest when considered as a discipline voluntarily submitted to for moral and religious ends. As such it is very widely diffused. Its modes and motives vary considerably according to climate, race, civilization, and other circumstances; but it would be difficult to name any religious system of any description in which it is wholly unrecognized.[3] The origin of the practice is very obscure.[4] Mr. Herbert Spencer has collected, from the accounts we have of various savage tribes in widely separated parts of the globe, a considerable body of evidence tending to suggest that it may have arisen out of the custom of providing refreshments for the dead, either by actually feeding the corpse, or by leaving eatables and drinkables for its use. The offerings to the dead are often made in so lavish a manner as necessarily to involve the survivors in temporary starvation, and it is no uncommon thing for a man to ruin himself by a funeral feast. It is suggested that the fasting which was at first the natural and inevitable result of such sacrifice on behalf of the dead may eventually have come to be regarded as an indispensable concomitant of all sacrifice, and so have survived as a well-established usage long after the original cause had ceased to operate.[5] It is not pretended that this explanation is sufficient to account satisfactorily for all the known cases of primitive fasting; indeed its extreme precariousness at once becomes evident when it is remembered that, now at least, it is usual for religious fasts to precede rather than to follow sacrificial and funeral feasts, if observed at all in connection with these. Mr. Spencer himself (p. 284) admits that "probably the practice arises in more ways than one," and proceeds to supplement the theory already given by another—that adopted by Mr. E. B. Tylor—to the effect that it originated in the desire of the primitive man to bring on at will certain abnormal nervous conditions favorable to the seeing of those visions and the dreaming of those dreams which are supposed to give the soul direct access to the objective realities of the spiritual world.[6] Probably, if we leave out of sight the very numerous and obvious cases in which fasting, originally the natural reflex result of grief, fear, or other strong emotion, has come to be the usual conventional symbol of these, we shall find that the practice is generally resorted to, either as a means of somehow exalting the higher faculties at the expense of the lower, or as an act of homage to some object of worship. The axiom of the Amazulu that the "continually stuffed body cannot see secret things" meets even now with pretty general acceptance; and if the notion that it is precisely the food which the worshipper foregoes that makes the deity more vigorous to do battle for his human friend be confined only to a few scattered tribes of savages, the general proposition that "fasting is a work of reverence toward God" may be said to be an article of the Catholic faith.[7]

Although fasting as a religious rite is to be met with almost everywhere, there are comparatively few religions, and those only of the more developed kind, which appoint definite public fasts, and make them binding at fixed seasons upon all the faithful. Brahmanism, for example, does not appear to enforce any stated fast upon the laity.[8] Among the ancient Egyptians fasting seems to have been associated with many religious festivals, notably with that of Isis (Herod. ii. 40), but it does not appear that, so far as the common people were concerned, the observance of these festivals (which were purely local) was compulsory. The *νηστεία* on the third day of the Thesmophoria at Athens was observed only by the women attending the festival (who were permitted to eat cakes made of sesame and honey). It is doubtful whether the fast mentioned by Livy (xxxvi. 37) was intended to be general or sacerdotal merely.

Jewish Fasts.—While remarkable for the cheerful, non-ascetic character of their worship, the Jews were no less distinguished from all the nations of antiquity by their annual solemn fast appointed to be observed on the 10th day of the 7th month (Tisri), the penalty of disobedience being death. The rules, as laid down in Lev. xvi. 29–34, xxiii. 27–32, and Numb. xxix. 7–11, include a special injunction of strict abstinence ("ye shall afflict your souls"[9]) from evening to evening. This fast was intimately associated with the chief feast of the year. Before that feast could be entered upon, the sins of the people had to be confessed and (sacramentally) expiated. The fast was a suitable concomitant of that contrition which befitted the occasion. The practice of stated fasting was not in any other case enjoined by the law; and it is generally understood to have been forbidden on Sabbath.[10] At the same time, private and occasional fasting being regarded as a natural and legitimate instinct, was regulated rather than repressed. The only other provision about fasting in the Pentateuch is of a regulative nature, Numb. xxx. 14 (13), to the effect that a vow made by a woman "to afflict the soul" may in certain circumstances be cancelled by her husband.

The history of Israel from Moses to Ezra furnishes a large number of instances in which the fasting instinct was obeyed both publicly and privately, locally and nationally, under the influence of sorrow, or fear, or passionate desire. See, for example, Judg. xx. 26; 1 Sam. vii. 6

---

[1] "The Fathers assembled there . . . decreed in that council that every person, as well in his private as public fast, should continue all the day without meat and drink, till after the evening prayer. And whosoever did eat or drink before the evening prayer was ended should be accounted and reputed not to consider the purity of his fast. This canon teacheth so evidently how fasting was used in the primitive church as by words it cannot be more plainly expressed." *Of Good Works: and first, of Fasting.*

[2] As indeed they are, etymologically; but, prior to the Reformation, a conventional distinction between *abstinentia* and *jejunium naturale* had long been recognized. "Exceptio eduliorum quorundam portionale jejunium est" (Tertullian).

[3] Confucianism ought perhaps to be named as one. Zoroastrianism is frequently given as another, but hardly correctly. In the Liber *Sad-der* indeed (Porta xxv.) we read, "Cavendum est tibi a jejunio; nam a mane ad vesperam nihil comedere non est bonum in religione nostra;" but according to the Père de Chinon (Lyons, 1671) the Parsee religion enjoins, upon the priesthood at least, no fewer than five yearly fasts. See Hyde, *Veterum Persarum Religio*, p. 449, 548 (ed. 1700).

[4] During the Middle Ages the prevalent notion was that it had its origin in paradise. The germ at least of this idea is to be found in Tertullian, who says: "Acceperat Adam a Deo legem non gustandi de arbore agnitionis boni et mali, moriturus si gustasset; verum et ipse tunc in psychicum reversus . . . facilius ventri quam Deo cessit, pabulo potius quam præcepto annuit, salutem gula vendidit, manducavit denique et periit, salvus alioquin si uni arbusculæ jejunare maluisset" (*De Jejuniis*, c. 3).

[5] *Principles of Sociology*, i. p. 170, 284, 285. Compare the passage in the appendix from Hanusch, *Slavischer Mythus*, p. 408.

[6] Spencer, *Prin. of Sociology*, i. 256, etc.; E. B. Tylor, *Primitive Culture*, i. 277, 402; ii. 372, etc.

[7] Hooker, *E. P.*, v. 72. In the Westminster Assembly's Larger Catechism fasting is mentioned among the duties required by the second commandment.

[8] The Brahmans themselves on the eleventh day after the full moon and the eleventh day after the new "abstain for sixty hours from every kind of sustenance;" and some have a special fast every Monday in November. See Picart, *The Religion and Manners of the Bramins.*

[9] נֶפֶשׁ is here to be taken as substantially equivalent to "desire," "appetite."

[10] See Judith viii. 6. "And yet it may be a question whether they (the Jews) did not always fast upon Sabbath," says Hooker (*E. P.*, v. 72, 7), who gives a curious array of evidence pointing in this direction. He even makes use of Neh. viii. 9–12, which might be thought to tell the other way. Justinian's phrase "Sabbata Judæorum a Mose in omne ævum jejunio dicata" (l. xxxvi. c. 2; comp. Suetonius in Octav. c. 76) may be accounted for by the fact that the day of atonement is called Sabbat Sabbatôn ("a perfect Sabbath").

(where the national fast was conjoined with the ceremony of pouring out water before the Lord); Jer. xxxvi. 6, 9; and 2 Sam. xii. 16.[1] Sometimes the observance of such fasts extended over a considerable period of time, during which, of course, the stricter *jejunium* was conjoined with *abstinentia* (Dan. x. 2). Sometimes they lasted only for a day. In Jonah iii. 6, 7, we have an illustrative example of the rigor with which a strict fast might be observed; and such passages as Joel ii. and Isa. lviii. 5 enable us to picture with some vividness the outward accompaniments of a Jewish fast day before the exile.

During the exile many occasional fasts were doubtless observed by the scattered communities, in sorrowful commemoration of the various sad events which had issued in the downfall of the kingdom of Judah. Of these, four appear to have passed into general use—the fasts of the 10th, 4th, 5th, and 7th months—commemorating the beginning of the siege of Jerusalem, the capture of the city, the destruction of the temple, the assassination of Gedaliah. As time rolled on they became invested with increasing sanctity; and though the prophet Zechariah, when consulted about them at the close of the exile (Zech. viii. 19), had by no means encouraged the observance of them, the rebuilding of the temple does not appear to have been considered an achievement of sufficient importance to warrant their discontinuance. It is worthy of remark that Ezekiel's prophetic legislation contains no reference to any fast day; the book of Esther (ix. 31), on the other hand, records the institution of a new fast on the 13th of the 12th month.

In the post-exile period private fasting was much practised by the pious, and encouraged by the religious sentiment of the time (see Judith viii. 6; Tob. xii. 8, and context; Sirach xxxiv. 26; Luke ii. 37, and xviii. 12). The last reference contains an allusion to the weekly fasts which were observed on the 2d and 5th days of each week, in commemoration, it was said, of the ascent and descent of Moses, at Sinai. The real origin of these fasts and the date of their introduction are alike uncertain; it is manifest, however, that the observance of them was voluntary, and never made a matter of universal obligation. It is probable that the Sadducees, if not also the Essenes, wholly neglected them. The second book (*Seder Moed*) of the Mishna contains two tractates bearing upon the subject of fasting. One (*Yoma*, "the day") deals exclusively with the rites which were to be observed on the great day of expiation or atonement; the other (*Taanith*, "fast") is devoted to the other fasts, and deals especially with the manner in which occasional fasting is to be gone about if no rain shall have fallen on or before the 17th day of Marcheschwan. It is enacted that in such a case the rabbis shall begin with a light fast of three days (Monday, Thursday, Monday), *i.e.*, a fast during which it is lawful to work, and also to wash and anoint the person. Then, in the event of a continued drought, fasts of increasing intensity are ordered; and as a last resort the ark is to be brought into the street and sprinkled with ashes, the heads of the Nasi and Abbeth-din being at the same time similarly sprinkled.[2] In no case was any fast to be allowed to interfere with newmoon or other fixed festival. Another institution treated with considerable fulness in the treatise *Taanith* is that of the אנשי מעמד (*viri stationis*), who are represented as having been laymen severally representing the twenty-four classes or families into which the whole commonwealth of the laity was divided. They used to attend the temple in rotation, and be present at the sacrifices; and as this duty fell to each in his turn, the men of the class or family which he represented were expected in their several cities and places of abode to engage themselves in religious exercises, and especially in fasting. The suggestion will readily occur that here may be the origin of the Christian *stationes*. But neither Tertullian nor any other of the fathers seems to have been aware of the existence of any such institution among the Jews; and very probably the story about it may have been a comparatively late invention. It ought to be borne in mind that the Aramaic portion of the *Megillath Taanith* (a document considerably older than the treatises in the Mishna) gives a catalogue only of the days on which fasting was forbidden. The Hebrew part (commented on by Maimonides) in which numerous fasts are recommended is of considerably later date. See Reland, *Antiq. Hebr.*, p. iv. c. 10; Derenbourg, *Hist. de Palestine*, p. 439.

Practice of the Early Christian Church.—Jesus himself did not inculcate asceticism in His teaching, and the absence of that distinctive element from His practice was sometimes a subject of hostile remark (Matt. xi. 19). We read, indeed, that on one occasion He fasted forty days and forty nights; but the expression, which is an obscure one, possibly means nothing more than that He endured the privations ordinarily involved in a stay in the wilderness. While we have no reason to doubt that he observed the one great national fast prescribed in the written law of Moses, we have express notice that neither He nor His disciples were in the habit of observing the other fasts which custom and tradition had established. See Mark ii. 18, where the correct reading appears to be—"The disciples of John, and the Pharisees, were fasting" (some customary fast). He never formally forbade fasting, but neither did He ever enjoin it. He assumed that, in certain circumstances of sorrow and need, the fasting instinct would sometimes be felt by the community and the individual; what He was chiefly concerned about was to warn His followers against the mistaken aims which His contemporaries were so apt to contemplate in their fasting (Matt. vi. 16–18). In one passage, indeed, He has been understood as practically commanding resort to the practice in certain circumstances. It ought to be noted, however, that Matt. xvii. 21 is probably spurious; and that in Mark ix. 29 the words "and fasting" are omitted by Westcott and Hort as well as by Tischendorf on the evidence of the Cod. Sinaiticus (first hand) and Cod. Vaticanus.[3] The reference to "the fast" in Acts xxvii. 9 has generally been held to indicate that the apostles continued to observe the yearly Jewish fast. But this inference is by no means a necessary one. According to Acts xiii. 2, 3, xiv. 23, they conjoined fasting with prayer at ordinations, and doubtless also on some other solemn occasions; but at the same time the liberty of the Christian "in respect of an holiday, or of the new moon, or of the Sabbath" was strongly insisted on, by one of them at least, who declared that meat whether taken or abstained from commendeth not to God (Col. ii. 16–23; 1 Cor. viii. 8; Rom. xiv. 14–22; 1 Tim. iv. 3–5). The fastings to which the apostle Paul alludes in 2 Cor. vi. 5, xi. 27, were rather of the nature of inevitable hardships cheerfully endured in the discharge of his sacred calling. The words which appear to encourage fasting in 1 Cor. vii. 5 are absent from all the oldest manuscripts and are now omitted by all critics;[4] and on the whole the precept and practice of the New Testament, while recognizing the propriety of occasional and extraordinary fasts, seem to be decidedly hostile to the imposition of any of a stated, obligatory, and general kind.

The usage of the Christian church during the earlier centuries was in this, as in so many other matters, influenced by traditional Jewish feeling, and by the force of old habit, quite as much as by any direct apostolic authority or supposed divine command. Habitual temperance was of course in all cases regarded as an absolute duty; and "the Bridegroom" being absent, the present life was regarded as being in a sense one continual "fast." Fasting in the stricter sense was not unknown; but it is certain that it did not at first occupy nearly so prominent a place in Christian ritual as that to which it afterwards attained. There are early traces of the customary observance of the Wednesday and Friday fasts—the *dies stationum* (Clem. Alex., *Strom.*, vii. 877), and also of a "quadragesimal" fast before Easter. But the very passage which proves the early origin of "quadragesima," conclusively shows how uncertain it was in its character, and how unlike the Catholic "Lent." Irenæus, quoted by Eusebius (v. 24), informs us with reference to the customary yearly celebration of the mystery of the resurrection of our Lord, that disputes prevailed not only with respect to the day, but also with respect to the manner of fasting in connection with it. "For some think that they ought to fast only one day, some two, some more days; some compute their day as consisting of *forty hours* night and day; and this diversity existing among those that observe it is not a matter that has just sprung up in our times, but long ago among those before us." It was not pretended that the apostles had legislated on the matter, but the general and natural feeling that the anniversaries of the crucifixion and the resurrection of Christ ought to be celebrated by Christians took expression in a variety of ways according to the differing tastes of individuals. No other stated fasts, besides those already mentioned, can be adduced from the time before Irenæus; but there was also a tendency—not unnatural in itself, and already sanctioned by Jewish practice—to fast by way of preparation for any season of peculiar privilege. Thus, according to Justin Martyr (*Apol.*, ii. 93), catechumens were accustomed to fast before baptism, and the church fasted with them. To the same feeling the quadragesimal fast which (as already stated) preceded the joyful feast of the resurrection, is to be, in part at least, attributed. As early as the time of Tertullian it was also usual for communicants to prepare themselves by fasting for receiving the eucharist. But that Christian fasts had not yet attained to the exaggerated importance which they afterwards assumed is strikingly shown in the well-known *Shepherd of Hermas* (lib. iii. sim. v.), where it is declared that "with merely outward fasting nothing is done for true virtue;" the believer is exhorted chiefly to abstain from evil and seek to cleanse himself from feelings of covetousness, and impurity, and revenge: "on the day that thou fastest content thyself with bread, vegetables, and water, and thank God for these. But reckon up on this day what thy meal would otherwise have cost thee, and give the amount that it comes to to some poor widow or orphan, or to the poor." The right of bishops to ordain special fasts, "ex aliqua sollicitudinis ecclesiasticæ causa" (Tertullian), was also recognized.

---

[1] There is, as Graf (*Gesch. Bücher des A. T.*, p. 41) has pointed out, no direct evidence that the fast on the 10th of the 7th month was ever observed before the exile. But the inference which he draws from this silence of the historical books is manifestly a precarious one at best. Bleek calls Lev. xvi. "ein deutliches Beispiel Mosaischer Abfassung" (*Einleitung*, p. 31, ed. 1878).

[2] The allusion to the ark warns us to be cautious in assuming the laws of the Mishna to have been ever in force.

[3] The idea, however, is found in the *Clementine Homilies*, ix. 9 Compare Tertullian *De Jejuniis*, c. 8. "Docuit etiam adversus diriora dæmonia jejuniis præliandum."

[4] On the manuscript evidence the words "I was fasting," in Acts x. 30, must also be regarded as doubtful. They are rejected by Lachmann, Tregelles, and Tischendorf.

Later Practice of the Church.—According to an expression preserved by Eusebius (*H. E.*, v. 18), Montanus was the first to give laws (to the church) on fasting. Such language, though rhetorical in form, is substantially correct. The treatise of Tertullian,—*Concerning Fasting: against the Carnal*,—written as it was under Montanistic influence, is doubly interesting, first as showing how free the practice of the church down to that time had been, and then as foreshadowing the burdensome legislation which was destined to succeed. In that treatise (c. 15) he approves indeed of the church practice of not fasting on Saturdays and Sundays (as elsewhere, *De Corona*, c. 3, he had expressed his concurrence in the other practice of observing the entire period between Easter and Pentecost as a season of joy); but otherwise he evinces great dissatisfaction with the indifference of the church as to the number, duration, and severity of her fasts.[1] The church thus came to be more and more involved in discussions as to the number of days to be observed, especially in "Lent," as fast days, as to the hour at which a fast ought to terminate (whether at the 3d or at the 9th hour), as to the rigor with which each fast ought to be observed (whether by abstinence from flesh merely, *abstinentia*, or by abstinence from lacticinia, *xerophagia*, or by literal *jejunium*), and as to the penalties by which the laws of fasting ought to be enforced. Almost a century, however, elapsed between the composition of the treatise of Tertullian (*cir.* 212) and the first recorded instances of ecclesiastical legislation on the subject. These while far from indicating that the church had attained unanimity on the points at issue, show progress in the direction of the later practice of catholicism. About the year 306 the synod of Illiberis in its 26th canon decided in favor of the observance of the Saturday fast.[2] The council of Ancyra in 314, on the other hand, found it necessary to legislate in a somewhat different direction,—by its 14th canon enjoining its priests and clerks at least to taste meat at the love feasts.[3] The synod of Laodicea framed several rules with regard to the observance of "Lent," such as that "during Lent the bread shall not be offered except on Saturday and Sunday" (can. 49), that "the fast shall not be relaxed on the Thursday of the last week of Lent, thus dishonoring the whole season; but the fast shall be kept throughout the whole period" (can. 50), that "during the fast no feasts of the martyrs shall be celebrated" (can. 51), and that no wedding or birthday feasts shall be celebrated during Lent" (can. 52). The synod of Hippo (393 A. D.) enacted that the sacrament of the altar should always be taken fasting, except on the Thursday before Easter. Protests in favor of freedom were occasionally raised, not always in a very wise manner, or on very wise grounds, by various individuals such as Eustathius of Sebaste (*c.* 350), Aerius of Pontus (*c.* 375), and Jovinian, a Roman monk (*c.* 388). Of the Eustathians, for example (whose connection with Eustathius can hardly be doubted), the complaint was made that "they fast on Sundays, but eat on the fast-days of the church." They were condemned by the synod of Gangra in Paphlagonia (*cir.* 860) in the following canons:—Can. 19, "If any one fast on Sunday, let him be anathema."[4] Can. 20, "If any one do not keep the fasts universally commanded and observed by the whole church, let him be anathema." Jovinian was very moderate. He "did not allow himself to be hurried on by an inconsiderate zeal to condemn fasting, the life of celibacy, monachism, considered purely in themselves. . . . He merely sought to show that men were wrong in recommending so highly and indiscriminately the life of celibacy and fasting, though he was ready to admit that both under certain circumstances might be good and useful" (Neander). He was nevertheless condemned (390) both by Pope Siricius at a synod in Rome, and by Ambrose at another in Milan. The views of Aerius, according to the representations of his bitter opponent Epiphanius (*Hær.* 75, "Adv. Aerium"), seem on this head at least, though unpopular, to have been characterized by great wisdom and sobriety. He did not condemn fasting altogether, but thought that it ought to be resorted to in the spirit of gospel freedom according as each occasion should arise. He found fault with the church for having substituted for Christian liberty a yoke of Jewish bondage.[5]

Towards the beginning of the 5th century we find Socrates (439) enumerating (*H. E.*, v. 22) a long catalogue of the different fasting practices of the church. The Romans fasted three weeks continuously before Easter (Saturdays and Sundays excepted). In Illyria, Achaia, and Alexandria the quadragesimal fast lasted six weeks. Others (the Constantinopolitans) began their fasts seven weeks before Easter, but fasted only on alternate weeks, five days at a time. Corresponding differences as to the manner of abstinence occurred. Some abstained from all living creatures; others ate fish; others fish and fowl. Some abstained from eggs and fruit; some confined themselves to bread; some would not take even that. Some fasted till three in the afternoon, and then took whatever they pleased. "Other nations," adds the historian, "observe other customs in their fasts, and that for various reasons. And since no one can show any written rule about this, it is plain the apostles left this matter free to every one's liberty and choice, that no one should be compelled to do a good thing out of necessity and fear." When Leo the Great became pope in 440, a period of more rigid uniformity began. The imperial authority of Valentinian helped to bring the whole West at least into submission to the see of Rome; and ecclesiastical enactments had, more than formerly, the support of the civil power. Though the introduction of the four Ember seasons was not entirely due to him, as has sometimes been asserted, it is certain that their widespread observance was due to his influence, and to that of his successors, especially of Gregory the Great. The tendency to increased rigor may be discerned in the 2d canon of the synod of Orleans (541), which declares that every Christian is bound to observe the fast of Lent, and, in case of failure to do so, is to be punished according to the laws of the church by his spiritual superior; in the 9th canon of the synod of Toledo (653), which declares the eating of flesh during Lent to be a mortal sin; in Charlemagne's law for the newly conquered Saxony, which attaches the penalty of death to wanton disregard of the holy season.[1] Baronius mentions that in the 11th century those who ate flesh during Lent were liable to have their teeth knocked out. But it ought to be remembered that this severity of the law early began to be tempered by the power to grant dispensations. The o-called Butter Towers (Tours de beurre) of Rouen, 1485–507, Bourges, and other cities, are said to have been built with money raised by sale of dispensations to eat lacticinia on fast days.

---

[1] Quinam isti (adversarii) sint, semel nominabo: exteriores et interiores botuli psychicorum. . . . Arguunt nos quod *jejunia propria* custodiamus, quod stationes plerumque in vesperam *producamus*, quod etiam *xerophagias* observemus, siccantes cibum ab omni carne et omni jurulentia et uvidioribus quibusque pomis, nec quid vinositatis vel edamus vel potemus; lavacri quoque abstinentiam congruentem arido victui.

[2] The language of the canon is ambiguous; but this interpretation seems to be preferable, especially in view of canon 23, which enacts that jejunii superpositiones are to be observed in all months except July and August. See Hefele, *Councils*, i. 148 (Engl. trs.).

[3] Compare the 52d [51st] of the Apostolical canons. "If any bishop or presbyter or deacon, or indeed any one of the sacerdotal catalogue, abstains from flesh and wine, not for his own exercise but out of hatred of the things, forgetting that all things were very good, . . . either let him reform, or let him be deprived and be cast out of the church. So also a layman." To this particular canon Hefele is disposed to assign a very early date.

[4] Compare canon 64 of the (supposed) fourth synod of Carthage: "He who fasts on Sunday is not accounted a Catholic" (Hefele, ii. 415).

[5] Priscillian, whose widespread heresy evoked from the synod of Saragossa (418) the canon, "No one shall fast on Sunday, nor may any one absent himself from church during Lent and hold a festival of his own," appears, on the question of fasting, not to have differed from the Encratites and various other sects of Manichean tendency (c. 406).

It is probable that the apparent severity of the mediæval Latin Church on this subject was largely due to the real strictness of the Greek Church, which, under the patriarch Photius in 864, had taken what was virtually a new departure in its fasting praxis. The rigor of the fasts of the modern Greek Church is well known; and it can on the whole be traced back to that comparatively early date. Of the nine fundamental laws of that church (*ἐννέα παραγγέλμάτα τῆς ἐκκλησίας*) two are concerned with fasting. Besides fasts of an occasional and extraordinary nature, the following are recognized as of stated and universal obligation:—(1) The Wednesday and Friday fasts throughout the year (with the exception of the period between Christmas and Epiphany, the Easter week, the week after Whitsunday, the third week after Epiphany); (2) The great yearly fasts, viz., that of Lent, lasting 48 days, from the Monday of Sexagesima to Easter eve; that of Advent, 39 days, from November 15th to Christmas eve; that of the Theotokos (*νηστεία τῆς θεοτόκου*), from August 1st to August 15th; that of the Holy Apostles, lasting a variable number of days from the Monday after Trinity; (3) The minor yearly fasts before Epiphany, before Whitsunday, before the feasts of the transfiguration, the invention of the cross, the beheading of John the Baptist. During even the least rigid of these the use of flesh and lacticinia is strictly forbidden; fish, oil, and wine are occasionally conceded, but not before two o'clock in the afternoon. The practice of the Coptic church is almost identical with this. A week before the Great Fast (Lent), a fast of three days is observed in commemoration of that of the Ninevites, mentioned in the book of Jonah. Some of the Copts are said to observe it by total abstinence during the whole period. The Great Fast continues fifty-five days; nothing is eaten except bread and vegetables, and that only in the afternoon, when church prayers are over. The Fast of the Nativity lasts for twenty-eight days before Christmas; that of the Apostles for a variable number of days from the Feast of the Ascension; and that of the Virgin for fifteen days before the Assumption. All Wednesdays and Fridays are also fast days except those that occur in the period between Easter nd Whitsunday. The Armenians are equally strict; but adds Rycaut) "the times seem so confused and without ule that they can scarce be recounted, unless by those who live amongst them, and strictly observe them, it being the chief care of the priest, whose learning principally consists in knowing the appointed times of fasting and feasting, the which they never omit on Sundays to publish unto the people."[2]

At the council of Trent no more than a passing allusion was made to the subject of fasting. The faithful were simply enjoined to submit themselves to church authority on the subject; and the clergy were exhorted to urge their flocks to the observance of frequent jejunia, as conducive to the mortification of the flesh, and as assuredly securing the divine favor. Bellarmine (*De jejunio*) distinguishes jejunium spirituale (abstinentia a vitiis), jejunium morale (parsimonia et temperantia cibi et potus), jejunium naturale (abstinentia ab omni prorsus cibo et potu, quacunque ratione sumpto), and jejunium ecclesiasticum. The last he defines simply as an abstinence from food in conformity with the rule of the church. It may be either voluntary or compulsory; and compulsory either because of a vow or because of a command. But the definition given by Alexander Halensis, which is much fuller, still retains its authority:—"Jejunium est abstinentia a cibo et potu secundum formam ecclesiæ, intuitu satisfaciendi pro peccato et acquirendi vitam æternam." It was to this last clause that the Reformers most seriously objected. They did not deny that fasting might be a good thing, nor did they maintain that the church or the authority might not ordain fasts, though they deprecated the imposition of needless burdens on the conscience. What they protested against was the theory of the opus operatum et meritorium as applied to fasting. As matter of fact, the Reformed churches in no case gave up the custom of observing fast days, though by some churches the number of such days was greatly reduced. In many parts of Germany, the seasons of Lent and Advent are still marked by the use of emblems of mourning in the churches, by the frequency of certain phrases (Kyrie eleison, Agnus Dei) and the absence of others (Hallelujah, Gloria in excelsis) in the liturgical services, by abstinence from some of the usual social festivities, and by the non-celebration of marriages. And occasional fasts are more or less familiar. The Church of England has retained a considerable list of fasts; though Hooker (*E. P.*, v. 72) had to contend with some who, while approving of fastings undertaken "of men's own free and voluntary accord as their particular devotion doth move them thereunto," yet "yearly or weekly fasts such as ours in the Church of England they allow no further than as the temporal state of the land doth require the same for the maintenance of seafaring men and preservation of cattle; because the decay of the one and the waste of the other could not well be prevented but by a politic order appointing some such usual change of diet as ours is."

In the practice of modern Catholicism the following are recognized as fasting days, that is to say, days on which one meal only, and that not of flesh, may be taken in the course of twenty-four hours:—The forty days of Lent (Sundays excepted), all the Ember days, the Wednesdays and Fridays in Advent, and the vigils of certain feasts, namely, those of Whitsuntide, of St. Peter and St. Paul, of the Assumption of the Blessed Virgin Mary, of All Saints, and of Christmas day. The following are simply days of abstinence, that is to say, days on which flesh at all events must not be eaten:—The Sundays in Lent, the three Rogation days, the feast of St. Mark (unless it falls in Easter week), and all Fridays which are not days of fasting. In the English Church, the "days of fasting or abstinence" are the forty days of Lent, the Ember days, the Rogation days, and all the Fridays in the year, except Christmas day. The evens or vigils before Christmas, the Purification of the Blessed Virgin Mary, the Annunciation of the Blessed Virgin Mary, Easter day, Ascension day, Pentecost, St. Matthias, the Nativity of St. John Baptist, St. Peter, St. James, St. Bartholomew, St. Matthew, St. Simon and St. Jude, St. Andrew, St. Thomas, and All Saints are also recognized as "fast days." By the 64th canon it is enacted that "every parson, vicar, or curate, shall in his several charge declare to the people every Sunday at the time appointed in the communion-book [which is, after the Nicene creed has been repeated] whether there be any holy-days or fast-days the week following." The 72d canon ordains that "no minister or ministers shall, without license and direction of the bishop under hand and seal, appoint or keep any solemn fasts, either publicly or in any private houses, other than such as by law are or by public authority shall be appointed, nor shall be wittingly present at any of them under pain of suspension for the first fault, of excommunication for the second, and of deposition from the ministry for the third." While strongly discouraging the arbitrary multiplication of public or private fasts, the English Church seems to leave to the discretion of the individual conscience every question as to the manner in which the fasts she formally enjoins are to be observed. In this connection the homily *Of Fasting* may be again referred to. By a statute of the reign of Queen Elizabeth it was enacted that none should eat flesh on "fish days" (the Wednesdays, Fridays, and Saturdays throughout the year) without a license, under a penalty. In the Scottish Presbyterian churches days of "fasting, humiliation, and prayer" are observed by ecclesiastical appointment in each parish once or twice every year on some day of the week preceding the Sunday fixed for the administration of the sacrament of the Lord's Supper. In some of the New England States, it has been usual for the governor to appoint by proclamation at some time in spring a day of fasting, when religious services are conducted in the churches. National fasts have more than once been observed on special occasions both in this country and in the United States of America.

[1] Cap. iii. pro partib. Saxoniæ: "Si quis sanctum quadragesimale jejunium pro despectu Christianitatis contempserit et carnem comederit, morte moriatur. Sed tamen consideretur a sacerdote ne forte causa necessitatis hoc cuilibet proveniat, ut carnem comedat." See Augusti, *Christliche Archäologie*, x. p. 374.

[2] See Fink's article "Fasten" in Ersch and Gruber's *Encyclopädie*; Lane, *Modern Egyptians*; and Rycaut, *Present State of the Armenian Church.*

On the subject of fasting the views of Aerius are to a large extent shared by modern Protestant moralists. Rothe, for example, who on this point may be regarded as a representative thinker, rejects the idea that fasting is a thing meritorious in itself, and is very doubtful of its value even as an aid to devotional feeling. Of course when bodily health and other circumstances require it, it becomes a duty; and as a means of self-discipline it may be used with due regard to the claims of other duties, and to the fitness of things. In this last aspect, however, habitual temperance will generally be found to be much more beneficial than occasional fasting. It is extremely questionable, in particular, whether fasting be so efficient as it is sometimes supposed to be in protecting against temptation to fleshly sin. The practice has a well ascertained tendency to excite the imagination; and in so far as it disturbs that healthy and well-balanced interaction of body and mind which is the best, or at least the normal, condition for the practice of virtue, it is to be deprecated rather than encouraged (*Theologische Ethik*, sec. 873–875).

Mahometan Fasts.—Among the Mahometans, the month Ramadan, in which the first part of the Koran is said to have been received, is by command of the prophet observed as a fast with extraordinary rigor. No food or drink of any kind is permitted to be taken from daybreak until the appearance of the stars at nightfall. Extending as it does over the whole "month of raging heat," such a fast manifestly involves considerable self-denial; and it is absolutely binding upon all the faithful whether at home or abroad. Should its observance at the appointed time be interfered with by sickness or any other cause, the fast must be kept as soon afterwards as possible for a like number of days. It is the only one which Mahometanism enjoins; but the doctors of the law recommend a considerable number of voluntary fasts, as, for example, on the tenth day of the month Moharram. This day, called the "Yom Ashoora," is held sacred on many accounts:—"because it is believed to be the day on which the first meeting of Adam and Eve took place after they were cast out of paradise; and that on which Noah went out from the ark; also because several other great events are said to have happened on this day, and because the ancient Arabs, before the time of the prophet, observed it by fasting. But what, in the opinion of most modern Moslems, and especially the Persians, confers the greatest sanctity on the day of Ashoora is the fact of its being that on which El-Hoseyn, the prophet's grandson, was slain a martyr at the battle of the plain of Karbala." It is the practice of many Moslems to fast on this day, and some do so on the preceding day also. Mahomet himself called fasting the "gate of religion," and forbade it only on the two great festivals, namely, on that which immediately follows Ramadan and on that which succeeds the pilgrimage. See Lane, *Modern Egyptians*, chaps. iii., xxiv. (J. S. BL.)

FASTING, CLAUS (1746–1791), a Danish poet, was born at Bergen in Norway on the 29th of October, 1746. In 1762 he came to reside in Copenhagen. He very early took an active part in letters, and was among the foremost champions of the romantic revival against French taste and the overpowering affectation of Klopstock, then personally reigning in the Danish capital. Fasting edited a brilliant æsthetic journal, the *Kritiske Tilskuer*, or Critical Observer, and in 1772 he formed in Copenhagen the Norwegian Society, a sort of literary club, which included among its members all the best young talent of the time. Soon after this, however, he returned to his native town, and from 1778 to 1781 edited there a journal entitled *Provinzialblade*, or Provincial Pages, in which he published most of his poems. In 1783 he was made a member of the municipal council of Bergen, and there he died in 1791. His works were first edited in 1837, when they were issued in one volume, with a biographical study by Lyder Sagen.

FATES, in Latin mythology, a name given to certain beings who, by euphemism similar to that which gave to the Greek ERINYES (*q. v.*) the name of Eumenides, were also known as Parcæ, or the Merciful. Originally the one Fatum, or *spoken word* of Jupiter, answered precisely to the single Aisa, the *spoken word* of Zeus, in the mythology of the Greeks. The conversion of one Fate into three had reference to the distinction of time into the past, present, and future; and thus the Fates answer to the Teutonic Norns or Weird Sisters.

FATHERS OF THE CHURCH. Ecclesiastically the word "father" is used in a variety of secondary significations. In the Old Testament even we find the name applied to priests (Judg. xvii. 10, xviii. 19), and to prophets (2 Kings ii. 12, vi. 21, xiii. 14), as well as to kings (2 Kings v. 13); and in the days of later Judaism there was a definite office which was known as that of the Father of the Synagogue.[1] In the Christian church almost every kind of spiritual relationship in which age or authority was in any way implied came to be expressed by some word denoting paternity. Thus we find such names as abba, papa, pater, bestowed occasionally upon godfathers, confessors, instructors, and almost invariably upon bishops and heads of monasteries. The decrees of the council of Nice are often referred to as those of the 318 fathers. The expression "church fathers" (patres ecclesiastici), however, has come to be used in a comparatively definite and restricted sense, as denoting in the aggregate those teachers of the ancient church who, from the close of the apostolic age onwards, either orally or in writing, expounded and defended the orthodox faith, and came to be acknowledged, either by tacit consent or by express declaration of the church, as duly qualified exponents of her doctrines. The title of father is generally held to imply soundness of doctrine, holiness of life, the approval of the church, and undoubted antiquity (Perrone). The word itself is fitted to suggest the idea of age, and also some such notion as that which is expressed in 1 Cor. iv. 15.

The patristic period of the church's history is generally held to begin with the close of the apostolic age; but historians are not agreed as to the date at which it may be said to have closed. Some Roman Catholic writers speak of Bernard, who died in 1153, as having been the "last of the fathers," while Greek patristic is often brought down so far as to the council of Florence. But it is usual to speak of the scholastic period as having begun with Anselm; and there seems to be no good reason for removing Bernard from the list of the schoolmen. As no very important author either in Latin or in Greek can be assigned to the centuries immediately preceding Anselm, it may therefore be said, roughly speaking, that the patristic period practically closed for the Eastern Church with Joannes Damascenus, and for the Western with Gregory the Great.

The patristic canon has never been quite definitely fixed, and no precise line of demarcation can be drawn between those ancient teachers of Christianity who are and those who are not entitled to be reckoned "fathers." The name is often bestowed on some whose title, when viewed from the standpoint of rigid orthodoxy, cannot but be regarded as somewhat doubtful. While Arius and Eusebius of Nicomedia have obviously no title to be called "fathers," it has not been thought necessary to withhold the honorable appellation from Origen or Tertullian.[2] The authors usually named as fathers may be arranged according to chronology into three groups, called respectively the apostolic, the primitive, and the post-Nicene. The apostolic fathers,—that is to say, the fathers who were to some extent contemporary with the apostles,—are Clement of Rome, Ignatius, Polycarp, the author of the *Shepherd of Hermas*, and the author of the *Epistle of Barnabas* (see APOSTOLIC FATHERS). The chief primitive or ante-Nicene fathers are Irenæus, Justin Martyr, Origen, Clement of Alexandria, Cyprian, Tertullian, Gregory Thaumaturgus. Among the post-Nicene fathers may be mentioned Ambrose, Athanasius, Augustine, Basil, Chrysostom, Cyril of Jerusalem, Cyril of Alexandria, Epiphanius, Gregory of Nazianzum, Gregory of Nyssa, Gregory the Great, Hilary, Jerome, and Leo. A distinction is usually recognized between the patres and those who were merely scriptores ecclesiastici, and it is to the latter category that such writers as Eusebius and Socrates the historians most properly belong. The Eastern and the

[2] See Perrone, *Loci Theologici*, p. ii. sect. ii. cap ii., De sanctis patribus.

Western Church have each four authors of note whom they recognize as fathers *par excellence.* Those of the Eastern are Athanasius, Basil, Chrysostom, and Gregory of Nazianzum. Those of the Western are Jerome, Ambrose, Augustine, and Gregory—the fathers respectively of her monastic system, of her sacerdotal authority, of her scientific theology, and of her popular religion (Milman, *Latin Christianity*, b. ii. c. 4).

The study of the fathers has sometimes been regarded as constituting a distinct discipline called patrology or patristic, which, however, practically resolves itself into the church history of the first six centuries. For information on the individual fathers and on the influence they exerted upon one another and upon the thought and life of the church the reader is referred to the various articles, biographical, archæological, and historical, relating to that period.

The much-disputed question as to the authority of the fathers resolves itself into the more general one as to the place of tradition considered as a source of dogma and a rule of life apart from the Scriptures (see vol. v. p. 663). There seems to be no sufficient evidence for the statement made by Turrettin and others to the effect that some Catholic writers set the writings of the fathers individually on a level with the canonical Scriptures; and it is certainly an exaggeration to say that Cardinal Cajetan regarded them as having no authority at all.[1] The Tridentine doctrine is that no one is entitled to interpret Scripture in a sense contrary to the interpretations of holy mother church or to the *unanimous* consent of the fathers.[2] Roman Catholic writers accordingly as a rule attach comparatively little weight to the peculiarities of individual fathers, and hold themselves committed to nothing that is not established by what they consider to be unanimous and unvarying tradition. They distinguish, moreover, between the function of the fathers as witnesses and their function as instructors. As witnesses to the tradition and teaching of the church, they give testimony which is binding on the Catholic conscience; as independent teachers, they are entitled to be listened to with deference and respect, but their interpretations and arguments are to be freely accepted or as freely rejected according to their merits.[3] Protestant writers, while fully admitting the merits, literary and other, of many of the fathers, usually dwell much upon the admitted fact of their fallibility, and strive to show that the attempt to establish an unambiguous tradition by their means is in very many cases much more illusory than Catholic writers are disposed to allow.[4] They do not, however, deny that on many important points there is such a thing as a consensus patrum; but this they regard as having at best no other authority than what is merely human and ecclesiastical, the Bible alone being the supreme rule of faith and life. The fundamental Protestant antithesis to the Tridentine doctrine according to which the canonical books and the traditions preserved by the church are to be received and reverenced "pari pietatis effectu ac reverentia" is very clearly expressed in the sixth Article of the Church of England, which declares that "Holy Scripture containeth all things necessary to salvation; so that whatsoever is not read therein nor may be proved thereby is not to be required of any man that it should be believed as an article of faith, or be thought requisite or necessary to salvation."

The first writer in patrology may be said to have been Jerome, himself one of the greatest of the fathers. His work, *De Viris Illustribus, sive Catalogus scriptorum ecclesiasticorum*, was reprinted, along with the similar works of Gennadius of Marseilles, Isidore of Seville, and Ildefonso of Toledo, by Fabricius in his *Bibliotheca Ecclesiastica* (1718). Among modern writers on this subject Möhler (*Patrologie*, 1842), Alzog (*Grundriss der Patrologie*, 1866), Engelhardt (*Litterarische Leitfaden zu Vorlesungen über die Patristik*, 1823), and J. E. L. Danz (*Initia doctrinæ patristicæ*, 1839) may be referred to. See also Cave's *Apostolici* (1677) and *Ecclesiastici* (1683), Ittigii *Tractatus de Bibl. Patr.* (Lips. 1707), and Dowling's *Notitia Scriptorum SS. Patrum* (Oxon. 1839). The most important collective editions of the fathers are the Latin *Magna Bibliotheca Veterum Patrum* of De la Bigne (Paris, 1575), of which the *Maxima Bibliotheca* (Lyons, 1677) is an improved reprint, and the exhaustive *Patrologiæ cursus completus* of Migne, in which the collection of Latin authors, brought down to the time of Innocent III., occupies 221 volumes (Paris, 1844–1855), while the Greek division, extending to the council of Florence, is completed in 166 vols. (Paris, 1857–1866). (J. S. BL.)

FATHIPUR, or FUTTEHPOOR, a district of British India in the Allahábád division, under the jurisdiction of the lieutenant-governor of the North-Western Provinces, lies between 25° 26′ 15″ and 26° 13′ 0″ N. lat., and 80° 19′ 0″ and 81° 25′ 0″ E. long. It is bounded on the N. by Rái Bareli and Sultánpur, E. by Allahábád, S. by Hamírpur and Bandá, and W. by Cawnpur. Fathipur district is situated in the extreme south-eastern corner of the *duáb* or tract of the country between the Ganges and the Jumna, which respectively mark its northern and southern boundary. The whole district consists of an alluvial plain formed by the deposits of the two great rivers. The central part is almost perfectly level, and consists of highly cultivated land, interspersed with tracts impregnated with saltpetre (*usar*) and jungle. A ridge of higher land, forming the watershed of the district, runs along it from east to west at an average distance of about five miles from the Ganges. Fathipur therefore consists of two inclined planes, the one five miles broad, sloping down rapidly to the Ganges, and the other, from fifteen to twenty miles broad, falling gradually to the Jumna. The country near the banks of the two rivers is cut up into ravines and *nalás* running in all directions, and is almost entirely uncultivable. Besides the Ganges and Jumna, the only rivers of importance are the Pándú, a tributary of the Ganges, and the Rind and Nún, which both fall into the Jumna. The census of 1872 returned the population of Fathipur at 663,877, of whom 593,256 were Hindus, 70,554 Mahometans, and 5 Christians. The area of the district is 1586 square miles, of which 871 are returned as cultivated, and 172 as cultivable. Two harvests are gathered during the year, the *kharif* or autumn crop, consisting chiefly of rice, *joár*, and *bájrá*, and the *rabí* or spring crop, consisting principally of wheat, barley, gram, oats, pease, etc. The principal lines of road are the grand trunk road, which runs through the whole length of the district from east to west, the Mughál road to Khajwá, and the Bandá road. The East Indian railway runs through the district parallel to the grand trunk roads, having stations at Khága, Barhampur, Fathipur, Malwa, and Mohar.

The civil station and principal town is Fathipur, situated on the grand trunk road in 25° 57′ N. lat. and 80° 54′ E. long.; population 19,879. It is also constituted a municipality, the municipal income in 1875 amounting to £1314, and the expenditure to £1196. The town carries on a considerable trade in grain, hides, grease, and soap. The other important trading towns are—Binki, the largest grain and cattle mart in the district; Khajwá, noted for its brass and copper work; Korah, with a trade in metal work, whips, and skins; Náráyani, with a large market for grain and local produce. The revenue of the district in 1876 was £165,409; the expenditure on civil administration, £54,404. The force for the protection of person and property in 1875 consisted of 522 regular police, costing £6732, and 1898 village watchmen, costing £6898. The schools in the district numbered 260 in 1875, attended by 6416 pupils, and costing £2662. The Fathipur charitable dispensary afforded medical relief in 1875 to 410 indoor and 4863 outdoor patients. The climate is more humid than in the other districts of the *duáb*, and although fevers are common, it is not considered an unhealthy district. The average annual rainfall is 35·7 inches.

The tract in which this district is comprised was conquered in 1194 by the Patháns; but subsequently, after a desperate resistance, it was wrested from them by the Mughals. In the 18th century it formed a part of the *subah* of Korah, and was under the government of the vizír of Oudh. In 1765, by a treaty between the East India Company and the nawáb, Korah was made over to the Delhi emperor, who retained it till 1772, when it was again restored to the nawáb vizír's dominions. Finally, in 1801, the nawáb, by treaty, reconveyed it to the company in commutation of the amount which he had stipulated to pay in return for the defence of his country. In June, 1857, the district rose in rebellion, and the usual murders of Europeans took place. Order was established after the fall of Lucknow, on the return of Lord Clyde's army to Cawnpur.

FATHIPUR SIKRI, a town in the Agra district in the

North-Western Provinces of India, on the road from Agra to Jáipur, situated in 27° 58′ N. lat. and 75° 5′ E. long. It is a ruined city, and is interesting only from an archæological point of view. It was founded by Akbar about 1570, as a thank-offering for the birth of a son, Selim, afterwards the emperor Jahangir, obtained through the intercession of a famous Mahometan saint. The principal building is the great mosque, which is said by Fergusson to be hardly surpassed by any in India. "It measures 550 feet east and west by 470 feet north and south, over all. The mosque itself, 250 feet by 80 feet, is crowned by three domes. In its court-yard, which measures 350 feet by 440 feet, stand two tombs. One is that of Selim Chisti [the holy man above mentioned], built of white marble, and the windows with pierced tracery of the most exquisite geometrical patterns. It possesses besides a deep cornice of marble, supported by brackets of the most elaborate design. The other tomb, that of Nawáb Islám Khán, is soberer and in excellent taste, but quite eclipsed by its surroundings. Even these parts, however, are surpassed in magnificence by the southern gateway. As it stands on a rising ground, when looked at from below, its appearance is noble beyond that of any portal attached to any mosque in India, perhaps in the whole world." Fathipur Sikri was a favorite residence of Akbar throughout his reign, and his palace was one of great magnificence. After Akbar's death, Fathipur Sikri was deserted, within 50 years of its foundation. The buildings are situated within a walled inclosure about seven miles in circumference. They are now all more or less in ruins. The town at present contains 8513 inhabitants.

FATIMAH (606–632), the daughter of Mahomet by his wife Khadijah, and one of the four women whom the prophet regarded as perfect, was born at Mecca in 606. At the age of fifteen she was married to Ali, of whom she was the only wife. The Arabian dynasty named Fatimites, which from 909 to 1171 ruled over Egypt and the northern part of Africa, and latterly over Syria and Palestine, claimed to be descended from Fatimah. The religious tenets of their adherents differed considerably from those of the orthodox Mahometans, and latterly they sought to give to the Koran an allegorical interpretation so as to avoid obedience to its literal precepts. See MAHOMET.

FATTORE, IL. See PENNI.

FAUCHER, LÉON (1803–1854), a French statesman and political economist, was of Jewish extraction, and was born at Limoges 8th September, 1803. His parents afterwards removed to Toulouse, and he found the means of supporting himself by the execution of designs for embroidery while attending the college of that place. From Toulouse he went to Paris, where for a short period he followed the profession of private tutor; but on the outbreak of the revolution of 1830 he became immersed in the political struggles of the time and a contributor to the political journals. In 1833 and 1834 he was editor of the *Constitutionnel*, after which he joined the staff of the *Courier*, and in 1839 became its editor. In politics he belonged to the party known as the dynastic left, and he was frequently consulted by the Thiers ministry of 1840. In 1842 the *Courier* changed hands, and on its new proprietors wishing slightly to modify its principles, Faucher resigned the editorship, and from that time devoted his attention almost exclusively to questions of political economy. In 1843 he visited England with the view of studying the social aspects of that country, and in October of the same year he began a series of articles in the *Revue des Deux Mondes*, recording the impressions made by his visit. These papers, though not altogether free from the defects incident to the imperfect knowledge of a foreigner, are characterized not less by shrewdness of observation than by able statement and illustration of economical principles, and form an important contribution towards the solution of the great social questions of the time. Shortly after this he became one of the editors of the *Journal des Economists*, to the pages of which he contributed several valuable papers, more especially on the tariff of customs. He also took a prominent part in the organization of the French association on the model of the free-trade league of England, but on account of the extreme opinions of the majority of its members he soon resigned his connection with it. In 1846, chiefly on account of his advocacy of free-trade doctrines, he was elected member of the chamber of deputies for Rheims, and in the chamber he took a leading part in the discussion of all economical and financial questions. After the revolution of 1848 he became a member of the new assembly for the department of Marne, and in December of the same year he was named minister of public works, and a little later minister of the interior; but he was compelled through the opposition manifested to his measures by the extreme republicans to resign his office 14th May, 1849. On 10th April, 1851, he again accepted the same office from Louis Napoleon, then president of the republic, but when Napoleon resolved to appeal to universal suffrage Faucher again resigned; and after the *coup d'état* he also refused to become a member of the constitutional commission instituted by the emperor. The occurrence of an affection of the throat which gradually assumed an alarming form induced him to pass the summer of 1854 in different parts of the Pyrenees. He had resolved to remain in Italy over the winter, but in November business affairs called him to Paris, and on his way back to Italy he was seized at Marseilles by typhoid fever, and died 14th December. During his whole political career Faucher maintained his probity unsullied, and in very difficult circumstances held with unswerving steadfastness to the path pointed out to him by convictions which were formed solely by a scientific study of political problems and an unprejudiced regard for the welfare of the human race. His economical writings are characterized by clearness of statement, fulness of information, incisiveness of reasoning, and firm grasp of principles. In relation to the cause of free trade in France he occupies, more than any other Frenchman, a position analogous to that occupied by Cobden in relation to the same cause in England; and perhaps both by his writings and by his former relations with Napoleon he had no small share, though an indirect and posthumous one, in bringing about the commercial treaty which through the intervention of Cobden was effected between the two countries in 1860.

The principal writings of Faucher were contributed to the *Revue des Deux Mondes*, and were published posthumously in 2 vols. under the title *Mélanges d'économie politique et de finance*, 1856. Among his other writings the principal are *Recherches sur l'or et sur l'argent, considérés comme étalons de la valeur*, 1843, and *Études sur l'Angleterre*, 2 vols., 1845. The former work and a portion of the latter have been translated into English. A short biography of Faucher, by Léonce de Lavergne, is contained in the *Revue des Deux Mondes* for January, 1855.

FAUCHET, CLAUDE (1530–1601), French historian and antiquary, was born at Paris in 1530. Of his early life few particulars are known. He applied himself to the study of the early French chroniclers, and proposed to publish extracts which would throw light on the first periods of the monarchy. During the civil wars he lost a large part of his books and manuscripts in a riot, and was compelled to leave Paris. He then settled at Marseilles. Attaching himself afterwards to Cardinal de Tournon, he accompanied him in 1554 to Italy, whence he was several times sent on embassies to the king, with reports on the siege of Siena. His services at length procured him the post of president of the chambre des monnaies, and thus enabled him to resume his literary studies. Having become embarrassed with debt, he found it necessary, at the age of seventy, to sell his office; but the king, amused with an epigram, gave him a pension, with the title of historiographer of France. Fauchet has the reputation of an impartial and scrupulously accurate writer; and in his works are to be found important facts not easily accessible elsewhere. He was, however, entirely uncritical, and his style is singularly inelegant. His principal works treat of Gaulish and French antiquities, of the dignities and magistrates of France, of the origin of the French language and poetry, of the liberties of the Gallican church, etc. A collected edition was published in 1610. Fauchet took part in a translation of the *Annals* of Tacitus, which appeared in 1582. He died at Paris about the close of 1601.

FAUCHET, CLAUDE (1744–1793) the Abbé Fauchet, a French constitutional bishop, and a noted actor in the Revolution, was born at Dornes, in the department of Nièvre, September 22, 1774. He devoted himself to the service of the church, passed through the usual course of studies, and was rapidly promoted. Before he was thirty years of age he made his mark as an orator in a panegyric of St. Louis, delivered before the French Academy. For some time he was engaged as tutor to the children of the marquis of Choiseul, a brother of the famous minister of

Louis XVI.; and he was afterwards nominated grand-vicar of the archbishop of Bourges, preacher to the king, and abbé of Montfort-Lacarre in Brittany. The influence of the new philosophy was clearly seen in his discourses, and the political tone of his sermon, *Discours sur les mœurs rurales*, at the festival of La Rosiere at Surènes, especially exposed him to censure. As he was proof against remonstrance, he was deprived of his office as preacher to the king. This occurred in 1788; and when in the following year the Revolution broke out, Abbé Fauchet was ready to fight with the foremost in the great cause. His speeches fired the primary assemblies and the sections of Paris, and on the memorable 14th of July he was one of those who led the people to the attack on the Bastille, displaying, it is said, not only courage under fire, but skill worthy of an accomplished officer. He was elected a member of the commune of Paris, figured in the clubs, blessed the tricolor flag for the National Guard, and by all means helped forward with a passionate zeal the revolutionary movement. He contributed to the reorganization of the church by his *Discours sur la religion nationale;* and in May, 1791, he was appointed constitutional bishop of Calvados. During the same period he had delivered three discourses on liberty, a discourse on the harmony of religion and liberty, the funeral oration of the Abbé de l'Épée, and an *Éloge civique* of Franklin. The last of these was spoken in the rotunda of the corn-market in the course of the festivities of the federation in July, 1790. In these pieces the swift progress of the Revolution was reflected in a growing intensity of sympathy and enthusiasm on the part of the orator; and hostility to the church carried him well nigh to a denial of the faith of which he was a minister. In the winter of 1790–91 Fauchet organized, in the precincts of the Palais Royal, his "Cercle Social," with regenerative intent, to be carried out chiefly by means of fluent oratory. He presided in the meetings under the self-assumed title of "Procureur général de la Vérité." Condorcet was one of his coadjutors, and "ten thousand persons of respectability" flocked to hear them,—a noisy and phantasmal affair, which came to a speedy end. In 1791 Fauchet was elected deputy to the legislative assembly, and afterwards to the convention. He wrote in favor of an agrarian law, voted against payment of priests who refused the oath to the constitution, and was one of the first to submit to the decree for suppression of ecclesiastical costume. The excesses of the Jacobins, however, alarmed him, and he began to incline towards the Girondists. On the trial of the king he spoke earnestly and courageously against the proposal to put him to death, and voted for the appeal to the people, imprisonment, and banishment. The execution of the king drove him still nearer to the party of the Girondists, and thus made him an object of the wrath of the Mountain. His name was one of those included in the proscription list, but he continued to act as secretary of the assembly till May 31, 1793, when the decree of accusation against the Girondists was passed. On the 18th July he was accused, not only as a Girondist, but also, and without ground, as an accomplice of Charlotte Corday, the murderer of Marat. He was sent to the Conciergerie, was condemned with the Girondist deputies by the revolutionary tribunal on October 30, and with them executed on the 31st.

FAUJAS DE SAINT-FOND, BARTHÉLEMI (1741–1819), French geologist and traveller, was born at Montélimart, May 17, 1741. He was educated at the Jesuits' College at Lyons; and, showing in his boyhood much poetic sensibility and a propensity to versifying, he received from some of his worldly-wise elders the earnest warning,—If you would succeed, don't make verses. He appears to have submitted to this counsel; for he went to Grenoble and applied himself to the study of law, and was admitted advocate to the parliament. He rose to be president of the seneschal's court (1765), a post which he honorably filled, but the duties of which became before long intolerably irksome, for his feeling for nature was not extinguished, and his favorite relaxation was found in visits to the Alps. His final bent, however, was not to the poetic but to the scientific interpretation of nature. In his frequent Alpine rambles he was amassing observations and facts, the full value of which could only be known at a later time. Geology was in its infancy, had scarcely even a name, when Faujas began his studies of the forms, structure, composition, and superposition of rocks, nor was it possible for him to divine how vast the science that was to arise upon the foundation of the facts of which he was so keen and so diligent an observer. In 1776 he put himself in communication with Buffon, who was not slow to perceive that the humble labors of Faujas would be of great service to him in his larger and more imaginative sphere of work. Invited by Buffon to Paris, he quitted the law, and was appointed by Louis XVI. assistant naturalist to the museum, to which office was added some years later (1785, 1788) that of royal commissioner for mines. In 1775 he had discovered in the Velay a rich mine of pozzuolana, which he opened, and which was largely worked by the Government. One of the most important of his works was the *Recherches sur les volcans éteints du Vivarais et du Velay*, which appeared in 1778. In this work, rich in facts and observations, he developed his theory of the origin of volcanoes. In his capacity of commissioner for mines Faujas travelled in almost all the countries of Europe, everywhere devoting his chief attention to the surface of the globe, and the nature and constituents of the rocks composing it. It was he who first called attention to the basaltic formation of the cave of Fingal (Staffa). He sustained heavy losses during the early years of the Revolution, but for these he was in 1797 indemnified by a grant made by the council of five hundred. Having been nominated in 1793 professor at the Jardin des Plantes, he held this post till he was nearly eighty years of age, retiring in 1818 to his estate in Dauphiné. Faujas took a warm interest in the balloon experiments of the brothers Montgolfier, and published a very complete *Description des expériences de la machine aërostatique de MM. Montgolfier*, etc. (1783, 1784). He contributed many scientific memoirs to the *Annales* and the *Mémoires* of the museum of natural history. Among his separate works, in addition to those already named, are—*Histoire naturelle de la province du Dauphiné* (1781, 1782); *Minéralogie des Volcans* (1784); *Voyage en Angleterre, en Ecosse, et aux Iles Hébrides* (1797); and *Essai de géologie* (1803–1809). Faujas died at his estate of Saint-Fond in Dauphiné, July 18, 1819.

FAUN. In Latin mythology, this name denoted a class of rural deities, who fostered the productive powers of the earth and of animals, and had their dwelling in woods and groves, where they sported with the nymphs. In the later traditions of the people, Faunus was said to have succeeded Picus and Saturnus as king of the Laurentes; but these names may, like many others in the mythology of Italy, be referred to processes or phenomena in the natural world, Saturnus or Seviternus being the god of the seed time and the harvest, and Picus the deity who cleaves the trees of the forest with the stroke of the lightning or the fury of the storm. There is much likeness between the characteristics of Faunus and those of the Greek Pan, and the two names may have a common origin, although the Latin Faunus has been regarded as an euphemistic name (from the root of the verb *faveo*) applied to deities whose anger was dreaded. As revealing the secrets of the future, whether by dreams or by strange sounds, the male Faunus and the female Fauna or Faula were known as fatuus and fatua, from the verb *fari*, to speak, which reappears in the Latin Fatum. In honor of these rural gods the festival of the Faunalia was celebrated yearly in December.

FAURIEL, CHARLES CLAUDE (1772–1844), a distinguished French historian, philologist, and critic, was born at St. Étienne, 21st October, 1772. His parents belonged to the artisan class, but their circumstances were such as to enable them to afford him a good education at Tournon and Lyons. Though from his earliest years preferring a life of study and retirement, Fauriel could not at first altogether escape the claims of the restless times in which he lived, and in 1793 he became sub-lieutenant in the fourth battalion of light infantry, then in garrison at Perpignan. He would appear to have resigned this appointment within a year, but it is certain in any case that he was for some time secretary to General Dugommier, and that he also served under Latour d'Auvergne. In 1794, however, he had returned to St. Étienne, where, but only for a short period, he filled a municipal office; and from 1795 to 1799 he devoted himself to strenuous study, more especially of the literature and history, both ancient and modern, of Greece and Italy. Having paid a visit to Paris in 1799, he was introduced to Fouché, minister of police, who immediately conceived for him a strong liking, and induced him to become his private secretary. The duties of this office

Fauriel discharged both to the satisfaction of Fouché and with such courtesy and kindness as to secure many lasting friendships; but he must have found it scarcely congenial; and as he continued to unite with the labor it entailed upon him the same continuous application to study as formerly, he found it necessary in 1801 to recruit his health by foreign travel. In resigning his office in the following year, he was therefore actuated doubtless as much by these considerations as by the ostensible excuse that he had scruples in serving longer under Napoleon, when the latter, in violation of strict republican principles, became consul for life.

Some articles which Fauriel in 1800 published in the *Decade* on a work of Madame de Staël were the means of ripening his slight acquaintance with that distinguished authoress into intimate friendship—a friendship which in its intellectual relations had considerable influence on her future career. Through her he was shortly afterwards introduced into the literary society of Auteuil. Neither in the literary history of his time nor in that particular circle can Fauriel be called the most prominent figure, but his position would not have been so unique in relation to either had it been more obtrusive. By nature strongly sympathetic, gifted also with a finely balanced judgment which was informed and cultivated to a high degree of perfection by an almost unexampled erudition, and so intensely interested in all that related to literature and history as to be almost forgetful of self and devoid of the love of fame, he soon became the confidant and almost the literary mentor of the most distinguished of his contemporaries, whom he benefited, not only by his contagious enthusiasm and suggestive criticism, but by placing at their disposal the results of his own laborious researches. Those who enjoyed his closest intimacy were the physiologist Cabanis and the Italian poet Manzoni, and perhaps after these, the historians Guizot and Thierry, the latter of whom in his preface to his *Études historiques* speaks of him as the friend and sure and faithful counsellor, whose judgment was his rule in doubt, and whose sympathy with his labors his greatest incentive to progress. During his connection with Auteuil the attention of Fauriel was naturally turned to philosophy, and from the letter which Cabanis addressed to him on final causes it would appear that he must be named the precursor of that school of philosophy in France which recognizes Cousin as its head—that he was the first to direct attention to the importance of studying philosophy in its historical relations, and to advocate what is known as eclecticism. His great merit indeed is in emphasizing the necessity of studying, not only the philosophy, but the general literature and civilization of modern times in their primitive sources; although it must be admitted that his preference for early and uncultured forms of literature has in it something of exaggeration. For some years he was engaged on a history of Stoicism, but perhaps more on account of his attention having been accidentally directed to the subject by others than from any special interest in philosophy, and at any rate the work was never completed, all the papers connected with it having accidentally perished in 1814. He also occupied himself at the same time with the study of Arabic, Sanskrit, and the old French dialects, but all with a special reference to his historical researches. The chief task he had set before him was an inquiry into the origin of modern civilization, the wide range of his preliminary studies being accounted for by the fact that they were of the nature of soundings taken with a view to discover with some approximation to certainty where the treasure he was in search of was concealed; and it was because he became convinced that the object of his quest was to be found in southern Gaul that his studies gradually came to have a bearing more or less direct on the elucidation of the early history of that country. His opinions on subjects which had an incidental relation to his chief purpose were occasionally contributed to periodicals; and as a kind of interlude to his severer studies he published in 1810 a translation of the *Parthenais oder die Alpenreise* of the Danish poet Baggesen, with a preface on the various kinds of poetry; in 1823 translations of two tragedies of his friend Manzoni, with a preface *Sur la théorie de l'art dramatique;* and in 1824 his translation of the popular songs of modern Greece, with a *Discours preliminaire* on popular poetry, in which he claims for that species of literature a preference in some respects over the most cultivated and artistic productions on account of its freshness and its intimate connection with nature and reality, and also as the best key to the comprehension of a nation's history, inasmuch as it is the spontaneous expression and outflow of its peculiar genius and of its deepest experiences.

After the revolution of 1830, the Government was persuaded by his friends to establish expressly for Fauriel a chair of foreign literature. In 1836 he was elected a member of the Academy of Inscriptions and Belles Lettres, and in the same year he published in four volumes *L'Histoire de la Gaule méridionale sous la domination des conquérants Germains*—the second portion of a work which, when completed, was to have consisted of three parts, the first on southern Gaul under the Roman dominion, and the third and most important embracing the period from the dismemberment of the empire of Charlemagne to the end of the 13th century, and including the brilliant though premature spring-time of early literature and culture which for a short period relieved the sterile winter that had so long overshadowed the intellect of Europe. In 1837 Fauriel published, along with an introduction, a translation of the Provençal poem on the war of the Albigenses, and in 1839 he became a member of the commission of the Histoire littéraire de la France, to which work he contributed a number of articles on the writers of the 13th century. He died 15th July, 1844. After his death appeared, in 1846, *Histoire de la littérature provençale,* which formed his course of professorial lectures for 1831–32, and may be regarded as a portion of the third part of the great work which he had sketched out on the history of southern Gaul. In these lectures he sought to prove that from the embers of the civilization of Greece and Rome, which, by a peculiar combination of circumstances, had been transferred not wholly quenched to the foreign soil of Provence, was lighted the spark which originated the greater part of the romances of chivalry (that is, not only those of the cycle of Charlemagne, but of the cycle of the Round Table), and thus kindled the civilization of modern Europe. Various opinions have been formed as to the amount of truth in this theory, and it must at least be admitted that Fauriel has been somewhat hampered and biased in his inquiry by preconceived conclusions; but in any case he must be allowed the merit of having first fully revealed the importance of the epoch of which he treats, and having supplied the greater part of the materials for the solution of the problems which it presents for discussion. Indeed, the distinguishing quality of his writings is their suggestiveness, and their value is therefore scarcely lessened even when their conclusions are disputed. The statement of Renan, made in 1855, that he is the man of our times who has put in circulation the greatest number of new ideas, can scarcely, however, be accepted, even when we remember his indirect influence on the contemporary writers of France; but none was more than he *en rapport* with the spirit of the 19th century, or has done a more important work in reference to those problems which are strictly literary or historical. The professorial lectures of Fauriel for 1833–34 were published in 1854, under the title of *Dante et les origines de la langue et de la littérature italiennes;* and among his miscellaneous writings the most important are his examination of the *Système de M. Raynouard sur l'origine des langues romanes,* contributed to the *Bibliothèque de l'École des Chartes,* and his lives of Dante and Lope de Vega in the *Revue des Deux Mondes* for October, 1834, and September, 1839, respectively.

The best and fullest account of Fauriel is that by Sainte-Beuve in his *Portraits Contemporains,* vol. iv. See also the review of Fauriel's work on Provençal literature by H. Fortoul in the *Revue des Deux Mondes* for May, 1846, and the short notice of his work on Dante by Renan in the *Revue des Deux Mondes* for December, 1855.

FAUST, or FUST, printer. See FUST.

FAUSTINA, ANNIA, wife of Marcus Aurelius, was the daughter of Antoninus Pius and the empress Annia Galeria Faustina Augusta. Her husband, whose original name was Marcus Annius Verus, was the son of her maternal uncle Annius Verus; and both, through their grandfather Annius Verus, consul for the third time in 126 A.D., traced their descent from Numa Pompilius. Besides Commodus, Faustina had six children whose names are known,—viz., Annius Verus, Annia Lucilla Augusta, Vibia Aurelia, Sabina, Domitia Faustina, Fadilla; but she is supposed to have had eleven. Faustina was either one of the most profligate or most maligned of women. Wieland appears to be almost her only apologist in modern times; and in her own day (if we accept the testimony of contemporary historians) the only man who believed in her virtue and goodness was her great and wise husband,—whose testimony, it has been urged, ought to be deemed sufficient to outweigh the gossip of Dion Cassius. On the other hand, it might be contended that the emperor was just as likely to misjudge the character of his wife as of his son Commodus, the buffoon of the imperial purple. The empress's impunity amid her alleged vices, and the emperor's patronage of her supposed paramours, have even been deemed unfavorable to the reputation for judgment and sincerity of one of the noblest men of antiquity. Faustina died in 175, at Halala, near Mount Taurus, in Cappadocia, whither she had accompanied Marcus in his expedition against the rebel Avidius Cassius, commander-in-chief of the imperial armies in Asia. Aurelius, in memory of his wife, raised the obscure village to the rank of a city, with the name of Faustinopolis. In her honor, too, he founded charitable schools for orphan girls—which were similar to those that Antoninus had established in memory of his own wife, the elder Faustina. The title *Mater Castrorum* first appeared on the coins of the younger Faustina. *Pudicitia* is another legend commemorative of this supposed incarnation of immodesty. Marcus Aurelius placed his wife's statue in the temple of Venus, and Faustina was numbered among the guardian deities of Rome.

FAUSTUS. Although probably the name of an actual historical personage, Faustus or Faust is principally interesting as an ideal figure of a twofold and in some respects antithetical type,—on the one hand the deliberate choice of evil, on the other an unsatisfied aspiration towards the highest good. The development of the latter conception from the former—of Goethe's Faust from the mediæval Faustus—is an interesting study in itself, and affords a curious example of the accretions and modifications incidental to popular myths. The Faustus of tradition arose from the fusion of two more primitive conceptions,—that of a compact with the evil one, of which the Theophilus of ecclesiastical legend supplies the typical example, and that of the subjugation of the infernal powers by intellectual pre-eminence, as in the cases of Virgil, Pope Sylvester, and Michael Scott. Early in the sixteenth century the two currents of tradition united in the person of an adventurer calling himself Faustus the Younger, from which it may be inferred that the name had already become typical. The existence of an elder Faustus cannot, however, be proved; nor can he, as sometimes suggested, be identified with Gutenberg's coadjutor, the printer Fust. A conjuring book bearing his name (*Dr. Faust's Dreifacher Höllenzwang*) exists in several MSS. dated early in the sixteenth century, and has been published in the magical collections of Scheible and Horst. It nevertheless appears from the style to be at least a century later. The younger Faust's own existence has been disputed, but apparently on no good grounds. He is mentioned as a contemporary by Trithemius (1507), Mutianus Rufus (1513), Begardi (1539), and Gast (1548). Trithemius denounces him as a charlatan, who purposely shunned him for fear of exposure. Rufus and Gast claim to have been actually in his company. The former entertains the same opinion of him as Trithemius; the latter considers that a learned dog and horse which accompanied him were probably devils. The same judicious author vouches for his having been carried away by the demon in or about the year 1525. This catastrophe is also mentioned in an inscription on a picture still extant in Auerbach's cellar at Leipsic, bearing that date, and depicting the feats familiar to Goethe's readers. Further particulars are given by Wier in his well known work *De præstigiis dæmonum*, and in Manlius's *Locorum communium collectanea* (1562), in a passage often erroneously attributed to Melanchthon, whose conversation Manlius is not reporting on this occasion. According to him, Faustus was born at Knittlingen in Würtemberg (the popular legend says Rohda in Saxony, and other places are also mentioned), and educated at the university of Cracow. However unworthy of such a distinction, he had evidently by this time become a popular hero, around whom the floating accumulations of legend respecting such national wizards as the Bohemian Zyto, the English Friars Bacon and Rush, and the Polish Twardowski were gradually tending to group themselves. These ultimately took shape in the standard version of Faustus's life, published at Frankfort by Johannes Spiess in 1587. This remarkable book, the work of an anonymous scholar acquainted with Latin, first mentions Mephistopheles as the name of Faustus's familiar spirit, introduces new elements suggested by the compiler's animosity to Rome, and gives especial prominence to the traditions which represent Faustus in connection with classical mythology. The effect is to exalt his importance as a type by exhibiting him as in some sort a representative of free thought and free learning, thus paving the way for Goethe's more profound interpretation of his alleged compact with the fiend. The more obvious tragic aspects of the situation were magnificently brought out by Marlowe, whose tragedy of *Faustus*, founded on an English translation of the German narrative, is thought to have appeared as early as 1589. Marlowe's play contains some of the finest dramatic poetry in our language, and he dwells with especial delight on Faustus's evocation of Helen, which by education and sympathy he was peculiarly qualified to apprehend. It was inevitable, however, that he should be principally studious of dramatic effect; and the perception of the full significance of this episode, as well as of the story generally, was reserved for a more reflective age. A more homely moral was drawn by Faustus's next biographer, Johann Wiedemann, who (1599) rewrote the narrative from an edifying point of view, interspersing copious historical parallels and theological disquisitions,—which latter, indeed, are not wanting in the earlier version,—and omitting what he deemed unsuitable for pious ears. His pedantic labors, subsequently revised in the same spirit by Pfitzer (1664), unfortunately led to the almost total disappearance of the older narrative, except in the abridged form of a chap book, in which it has survived nearly to our own times, and has even been reprinted in America. Another development of the myth was now at hand—the dramatic. It formed the theme of *Justi Placidii infelix prudentia*, a play in Latin verse published at Leipsic in 1598. By 1618, as appears from Ayrer's *Opus Theatricum*, a play on the subject was a stock piece on the boards of the German puppet-theatre. Heine thinks that it was introduced by the English itinerant players who traversed Germany at the time,—a supposition confirmed by Lessing's previous indication of an English element in the text. These marionette pieces long maintained themselves as a popular entertainment. Zedler mentions them as still frequently performed in 1735; Heine saw the story of Faustus thus represented as late as 1826. It was not committed to writing, and was partly extemporized for the occasion. Restorations have nevertheless been given by Scheible (1847), Hamm (1850), and Engel (1872). Such representations undoubtedly served to keep the legend alive until it met with critics and poets able to discern its significance in the persons of Lessing and Goethe. The original draft of the latter's *Faust*, as pointed out by Heine, is almost entirely based upon the puppet representation. Lessing's interest in Faust is believed to have been awakened by a performance of the old play at Berlin in 1753. He took up the subject shortly afterwards, and, according to his own statement, at different periods of his life sketched out the ground plan of two versions,—the first on the lines of the original legend, the second without any supernatural element. Both are said, on his own authority, to have been nearly completed in December, 1775, but were probably lost in the following year, along with a trunk containing other MSS. An anonymous *Faust* appeared in 1775 at Munich, and has recently been republished as Lessing's, which it certainly is not. The conception of Goethe's *Faust* was formed as early as 1770, and, according to the contemporary testimony of Merck, the composition had made great progress as early as 1775. The first part, notwithstanding, was not completed until 1807, nor the second until 1831. The analysis of this wonderful work will fall more appropriately under the heading GOETHE (*q. v.*). It need only be remarked here that, while Goethe has finally achieved the transformation of Faustus from a vulgar conjurer into a personification of humanity in one of its most interesting phases, the result, in the first part, is still inadequate to the power of the machinery and the dignity of the situation. As Charles Lamb tersely expressed it, "What has Margaret to do with Faust?" The much abused and underrated second part may be regarded as an endeavor to remedy this defect, which might have fully succeeded but for the taste for allegory which had become a mania with Goethe in his later years. The Helena episode is nevertheless a masterpiece, and the fifth act presents the quintessence of Goethe's wisdom with the authority of a last testament:—

> "Ja, diesem Sinne bin ich ganz ergeben:
> Das ist der Weisheit letzter Schluss!"

Among later attempts at a literary treatment of the Faust legend may be mentioned Klinger's romance, translated into English by Borrow, and chiefly remarkable for the introduction of the Borgia family; Klingemann's unwittingly burlesque tragedy, "the hero of which is not the old Faust driven desperate by the uncertainty of human knowledge, but plain John Faust the printer driven desperate by an ambitious temper and a total deficiency of cash" (Carlyle); Heine's ingenious and highly dramatic ballet (*Der Doktor Faust, ein Tanzpoem*); and Lenau's poem, partly epic and partly dramatic, not deficient in isolated beauties, but a mere repetition of Goethe in all essential respects. Goethe's example, as well as the generally subjective character of modern poetry, has led to the creation of a number of ideal figures impersonating some particular thought or principle, and betraying more or less affinity to their original. Such are the Manfred of Byron, the Paracelsus of Browning, the Balder of Dobell, the Spiridion of George Sand, the Konrad Wallenrod of Mickiewicz, last and not least remarkable the Brand of the Norwegian poet Ibsen. The affinity between the typical figures of Faustus and Tannhäuser is very powerfully indicated in the last poem of the lyrical collection entitled *Der neue Tannhäuser*, by Eduard Grisebach (1871).

The best works on the history of the Faustus legend are—Eistelhuber, *Faust dans l'histoire et dans la légende* (Paris, 1863); Düntzer, *Die Sage von Dr. Johann Faustus* (Stuttgart, 1846); the article by W. Sommer in Ersch and Grüber's *Encyclopædia*, and that in Meyer's *Conversations Lexicon*. For its bibliography see Peter, *Die Literatur der Faustsage* (3d edit. Leipsic, 1857), and the "Bibliotheca Faustiana" in the first part of Engel's *Deutsche Puppenkomödien* (1872). The earliest extant edition of the English version of the German legend, from which it departs in several respects, bears date 1592, but the work had been published previously. It is reprinted in the third volume of Thoms's *Early English Prose Romances* (1827). (R. G.)

FAVARA, a town of Sicily, in the province of Girgenti, is situated 5 miles E.S.E. of Girgenti in a mountainous district near the Hypas, a tributary of the Acragas. It possesses a beautiful old chateau of the Charamonti family, built in the 14th century. In the neighborhood of Favara there are large sulphur mines, marble quarries, and deposits of bitumen; and it has also a considerable trade in grain and fruits. The population in 1871 was 15,197.

FAVART, Charles Simon (1710–1792), French dramatist, was born at Paris, November 13, 1710. He was the son of a noted pastry-cook, a man of some parts who in his leisure hours amused himself with making verses. The son was educated at the college of Louis-le-Grand, and after his father's death carried on the business for a time for the sake of his mother. His first success in literature was a poem entitled *La France délivrée par la Pucelle d'Orléans*, which obtained the prize of the Académie des Jeux Floraux. After the production of his first vaudeville, *Les Deux Jumelles*, circumstances enabled him to relinquish his business and devote himself entirely to the drama. He provided many pieces anonymously for the lesser theatres, and first put his name to *La Chercheuse d'Esprit*, which was produced in 1741. Among his most successful works were *Annette et Lublin*, *Le Coq du Village* (1743), *Ninette à la Cour* (1755), *Les Trois Sultanes* (1761), and *L'Anglais á Bordeaux* (1763). Favart became director of the Opéra Comique; and in 1745 he married Mademoiselle Duronceray, a beautiful young singer and actress who had made a successful début the year before. By their united talents and labors the Opéra Comique rose to such a height of success that the jealousy of rival theatres was aroused, and through their influence the house was suppressed the same year. Favart thus left without resources accepted the proposal of Marshal Saxe, and undertook the direction of a troop of comedians which was to accompany his army into Flanders. It was part of his duty to compose from time to time impromptu verses on the events of the campaign, amusing and stimulating the spirits of the men. So popular were Favart and his troop that "the enemy" became desirous of sharing his services, and permission was given to gratify them, battles and comedies thus curiously alternating with each other. But in the midst of his success a heavy blow fell upon him. The marshal had looked with evil eyes upon Favart's young wife, and attempted to seduce her. To escape him the wife fled to Paris, and the wrath of the foiled adulterer fell upon the husband. A *lettre de cachet* was issued against him, and he only saved himself by flight and concealment in a cave. Madame Favart meanwhile had been distinguishing herself at the Comédie Italien; but as she still rejected the brutal advances of the marshal, she was suddenly arrested and confined in a provincial convent, where she was treated as a prisoner of state. After an imprisonment of more than a year her fortitude gave way, and, yielding to the will of her pursuer, she was at length liberated. After the marshal's death in 1750, Favart returned to Paris, and resumed his pursuits as a dramatist. It was at this time that the Abbé de Voisenon became intimately associated with him and took part in his labors, though to what extent is uncertain. Madame Favart, after a long and painful illness, died at Paris, April 22, 1772. She is remembered as a bold reformer of stage costumes, breaking with the custom of dressing all the *dramatis personæ* in court or showy style, and introducing the use of costumes appropriate to the various characters. She had remarkable powers of mimicry, especially of the speech and accent of foreigners. She assisted her husband in some of his best productions. He felt her loss deeply, survived her twenty years, becoming nearly blind in his last days, and died at Paris, May 12, 1792. His works have been several times republished. In 1809 appeared his *Mémoires et Correspondance littéraire, dramatique, et anecdotique*, which furnish valuable information on the state of the literary and theatrical worlds in the 18th century. This work, in 3 vols. 8vo, was edited by his grandson A. P. C. Favart and H. F. Dumolard.

FAVERSHAM, or Feversham, a municipal borough and market-town of England, county of Kent, is situated 10 miles W.N.W. of Canterbury, and 47 E.S.E. of London by rail. The town consists of four principal streets, forming an irregular cross, in the centre of which are the town-hall and market-place. The parish church is a spacious cruciform structure, surmounted by a tower and spire; both its exterior and its interior have lately undergone restorations. Faversham has a free grammar school, a national school, a theatre, and assembly-rooms. Faversham Creek, which communicates with East Swale, is navigable up to the town for vessels of 150 tons. The shipping trade is pretty extensive, chiefly in coal, timber, and agricultural produce. The oyster fisheries are the principal industry, but brewing, brickmaking, and the manufacture of Roman cement are carried on, and there are several large powder mills in the vicinity of the town.

Faversham is very ancient, and on account of its situation directly opposite the south-east extremity of the Isle of Sheppey early rose into consideration. In 812 it was styled "the king's little town of Fefresham," and in 930 it was the meeting place of a *witan* or national council. King Stephen and Queen Maud founded here, in 1147, a Cluniac abbey, and both they and their son, Eustace count of Boulogne, were buried within its walls. It was to Faversham that the boatmen conveyed James II. after preventing his escape in a small vessel lying at Shellness. The population in 1871 was 7198.

FAVORINUS, *Φαβωρῖνος*, a celebrated sophist, flourished during the reign of Hadrian. A Gaul by birth, he was a native of Arles, but at an early age began his life-long travels through Greece, Italy, and the East. He may have acquired some knowledge of Latin and Greek even before he left Gaul, for Arles was within a short distance of the Phocian colony of Marseilles—that "Athens of the West" which Varro calls "trilinguis," and which, according to Strabo, had taught the Gauls to become Philhellenes. His extensive knowledge, combined with great oratorical powers, raised him to eminence both in Athens and Rome. With Plutarch, who dedicated to him his treatise *περὶ τοῦ πρώτου ψυχροῦ*, with Herodes Atticus, to whom he bequeathed his library at Rome, with Demetrius of Alexandria, Cornelius Fronto, and Aulus Gellius, with Hadrian himself, he lived on intimate terms. His good humor appears to have been as inexhaustible as his wit, though in his later years he condescended to violent abuse of his rival Polemon, who divided with him the suffrages of Asia, the Smyrniote faction pronouncing Polemon to be the greater rhetorican of the two, while that of Ephesus declared for Favorinus. It was Favorinus who, on being silenced by Hadrian in an argument in which the sophist might easily have refuted his adversary, made the subsequent explanation to his friend that it was foolish to criticise the logic of the master of thirty legions. It was one of his sarcastic boasts that though he had offended Hadrian he still continued to live. When the servile Athenians, feigning to share the emperor's displeasure with the sophist, pulled down a statue which they had erected to the latter, Favorinus remarked that if Socrates also had only had a statue at Athens, he might have been spared the hemlock. Of the very numerous works of Favorinus, we possess only a few fragments preserved by Aulus Gellius, Diogenes Laertius, Philostratus, and Suidas, the second of whom borrows from his Παντοδαπὴ Ἱστορία. His Πυῤῥώνειοι Τρόποι, in ten books, mentioned by Philostratus in his *Lives of the Sophists*, i. 8, § 4, appears to have been his chief work.

The most modern sources of information regarding the life and work of Favorinus are *Fragmenta Philosophorum Græcorum*, collected and annotated by F. W. A. Mullach, Paris, 1857 and 1860. See also J. F. Gregor's *Commentatio de Favorino*, 1755, and Forsmann's *Dissertatio de Favorino*, 1789.

FAWKES, Francis (1721–1777), a poet and translator, was a native of Yorkshire, and was born in the year 1721. After studying at Jesus College, Cambridge, where he graduated M.A., he entered into holy orders, and was successively curate of Bramham, curate of Croydon, vicar of Orpington, and rector of Hayes, and finally was made one of the chaplains to the princess of Wales. He published *Bramham Park, a Poem*, in 1745; a volume of poems and translations in 1761; and *Partridge Shooting, a Poem*, in 1767. His translations of the minor Greek poets—Anacreon, Sappho, Bion and Moschus, Musæus, Theocritus, and Apollonius—acquired for him considerable fame, but it may be safely predicted that when they are forgotten Fawkes will be remembered for his fine song, *Dear Tom, this brown jug, that now foams with mild ale.* He also edited a Family Bible with notes. He died on the 26th August, 1777.

FAWKES, Guy (1570–1606), the most notorious of the Gunpowder Plot conspirators, was born at York, of a gentle family, in the year 1570. His grandfather and father were notaries and proctors of the ecclesiastical courts of York, the former being registrar of the exchequer court of the province, the latter an advocate of the consistory court of the cathedral. It is believed that the family was connected with the ancient house of the Fawkeses of Farnley in Yorkshire, but the evidence of such connection does not amount to proof. Guy was educated at the free school at the "Horsefayre," just outside the city of York, and had for schoolfellows Thomas Morton, afterwards bishop of Durham, and Thomas, grandson of Sir John Cheke. The school was under the superintendence of the dean and chapter, and this, and the fact of his immediate ancestors being employed in the ecclesiastical courts, would have led us to conclude that Fawkes was brought up in conformity to the established church. But we have more direct evidence of this, for the names, both of his parents and of his grandmother, occur several times in the list of communicants of the parish of St. Michael-le-Belfrey in which they lived. Perhaps the most determinant event in Fawkes's life happened when he was quite young. His father died when he was about eight years old, and before he came of age his mother married again. Her second husband was one Dionis Baynbridge, settled at Scotton near Knaresborough. Baynbridge was connected with several Roman Catholic families. Several families, steadfast in the old faith, were settled near Scotton,—among them, that of Sir William Ingilby of Ripley, whose sister was mother of the Robert, Thomas, and John Winter with whom, later in life, Fawkes was brought into such close contact. For some years he lived under the roof of his stepfather, who, we have every reason to believe, was a Roman Catholic. Guy was the only son and, as there was no will, the sole heir of his father. He said in confession, "My father left me but small living, which I spent." There is, in fact, evidence that when he came of age he sold the little land left him, and soon after, as it appears, enlisted as a soldier of fortune in the army of Flanders, and is said to have been present at the taking of Calais by the Archduke Albert in 1598. He was sent by Sir William Stanley and the Jesuits in Flanders to join Christopher Wright in a mission to the king of Spain immediately after the death of Elizabeth. Early in 1604 he was again in Flanders and with Stanley.

The Catholics in England had hoped much from the accession of James I. To facilitate his passage to the throne, he had given great cause for such hopes, promising that the fines against recusants should not be exacted, and bestowing honors upon several Roman Catholic gentlemen. Therefore, when, after James was securely seated on the throne, the severe laws of Elizabeth against priests and recusants were again put into execution, many Roman Catholic gentlemen experienced feelings of deep resentment. Robert Catesby, a man steeped in plots, conspiracies, and secret embassies, but a gentleman of great personal power and fascination, conceived a plan for the remedy of all this His parents had suffered much for their religion, and h himself had been an incessant plotter among the discontented Catholics of the later years of Elizabeth's reign, and for joining in Essex's rebellion had been heavily fined. But there is no reason to believe that he, or indeed any of the conspirators, were actuated by selfish motives or feelings of revenge in assenting to that scheme for the carrying out of which they dared and suffered so much. Catesby's own words probably express best the way in which they regarded the matter. "The nature of the disease," he said, "requires so sharp a remedy." It should also be remembered that the plot was conceived and entered upon before the more severe execution of the laws against recusants. Catesby's plan was to blow up king, lords, and commons in the Parliament House with gunpowder. Early in 1604 he wrote to his cousin Thomas Winter desiring him to come to London. Winter, after some hesitation, having consented, found Catesby at Lambeth with John Wright. All three were old plotters and companions in plots and conspiracies. Catesby now broached his new scheme to Winter, who at first wondered at the strangeness of the conception and doubted of success, but finally gave his consent to it or to anything that Catesby should decide to enter upon. Wishing, however, to leave no quiet way untried to obtain their end, it was decided that Winter should go over to Flanders, to meet Velasco, the constable of Castile, who was coming to England to negotiate the peace with Spain. Winter was to inform the constable of the state of the Catholics in England, and to entreat him to solicit the king that the penal laws against them might be recalled. Catesby named Fawkes as a likely man in case this quiet way failed. Winter saw the constable at Bergen, and giving up the hope that much would be done by his means, sought out Fawkes, whom he found with Stanley at Ostend. Representing to him that something was in hand to be done in England, they passed together from Gravelines to Greenwich April 22, 1604, and at once went to Catesby. At a meeting soon after they were joined by Thomas Percy, another zealous Romanist, a relative of the earl of Northumberland, and one of the king's pensioners. The plot was propounded and approved of; all took a solemn oath of secrecy and perseverance, and afterwards received the sacrament from Gerard, a Jesuit, who was in another room. In May a house adjoining the Parliament House was hired in Percy's name, from the cellars of which the conspirators proposed to work a mine. Having, however, with great labor worked about half-way through the nine feet of stone which composed the wall, they discovered that a vault, immediately under the House of Lords, was to let, and as this exactly suited their purpose, it was at once engaged by Fawkes, who, being little known in England, passed as Percy's servant, and took the name of Johnson. Barrels of gunpowder which had been stored in a house at Lambeth were brought over in the night, large stones and bars of iron were placed upon them, and the whole covered with billets of wood, so that no suspicion might be excited in case it was found necessary to admit a stranger. All was prepared about May, 1605. The plan of the plot was that after the blow had been given, as most probably the Prince of Wales would attend and perish with the king, the duke (Charles) was to be seized and carried into the country if possible; or otherwise possession was to be obtained of the person of the Princess Elizabeth, who was then at Combe Abbey in Warwickshire, and a rising was to be prepared among the Catholics of the midland counties. Fawkes was to fire the train, and then to get over as quickly as possible into Flanders in a ship prepared for his passage. After being several times prorogued, parliament was to meet on the 5th of November.

During the progress of the preparations many other gentlemen, Robert Winter, Christopher Wright, Keyes, Rookwood, Sir Everard Digby, and Francis Tresham, had been sworn in by Catesby to assist with labor or money. In the interval between the completion of the preparations and the opening of parliament, Fawkes was sent into Flanders to acquaint Stanley and Owen the Jesuit with the plot, and to secure their co-operation after the event of the explosion. A great cause of disagreement among the conspirators was the fact that the Catholic lords and members of parliament would be destroyed in a common catastrophe with those whom the plot was specially intended to strike. That the Catholics should somehow be warned there was general agreement, but not as to the method in which the warning should be given. This disagreement no doubt caused the failure of the whole transaction. Ten days before the opening of Parliament, Lord Monteagle, a Catholic and a friend of several of the conspirators, received an anonymous letter giving him a warning, couched in ambiguous terms, not to attend the opening, for "they shall receyve a terrible blowe this parleament." It is not known who wrote the letter. Tresham was, and is, generally suspected; but when Catesby accused him of it, he vehemently and with oaths denied all knowledge of the matter. Something in the character of the letter and of the attendant circumstances seems to render it probable that the whole thing was prepared beforehand to quash the plot, but in such a manner that the Government should not be fully alive to the danger until the conspirators had had time to escape. It has also been suggested that the whole plot itself was got up by Cecil, and was nothing but a state trick. However, Monteagle at once took this letter to Salisbury, who communicated it to the king, directly his Majesty returned from Royston, where he had been hunting, and it seems to have been at once decided that every precaution should be taken. Winter received warning that all was discovered. Tresham also warned Catesby and the others that all was known, and passionately desired them to make good their escape to foreign lands. They, however, determined to await further events, and Fawkes especially stuck to his post in the vault with that coolness of courage which seems to have been one of his chief characteristics.

The Lord Chamberlain on the 4th November, going over the Parliament House to see that all was prepared for the morrow, visited the vault, and there saw this "very tall and desperate fellow," who, together with the large quantity of fuel, exciting suspicions which he communicated to the king, it was decided that a more strict search should be made. Sir Thomas Knevet, a Westminster magistrate, was ordered to direct this search, and going down to the house suddenly, just before midnight, he came upon Fawkes just stepping out of the door. The 36 barrels of powder were discovered; Fawkes was seized, bound with his own garters, and searched. Upon him were found a watch, a tinder box, and some touchwood. He at once avowed his purpose, and said that if he had been within the house when taken he would have blown up house, takers, himself, and all. He was taken to Whitehall and examined before the king. Answering all questions with careless sarcastic indifference, he would say nothing to implicate his confederates. The other conspirators fled into the country to Dunchurch, where a meeting of the Catholic gentry had been convened under pretence of a hunting party. In the hue and cry which followed, all were either killed or taken. Fawkes and the others were repeatedly examined, and torture was, no doubt, in his case used to break the wonderful will and nerve of the man. On 27th January, 1606, the trial took place. All were condemned to be drawn, hanged, and quartered. On Thursday the 30th, Digby, R. Winter, Grant, and Bates (Catesby's servant) suffered in St. Paul's churchyard; the next day, T. Winter, Rookwood, Keyes, and Fawkes, at Westminster. So all yet alive who, from belief in the cause or from love of Catesby, had joined his outrageous plot ascended the scaffold, Fawkes last; "his body being weak with torture and sickness, he was scarce able to go up the ladder." He "made no long speech, but after a sort seeming sorry for his offence, asked a kind of forgiveness of the king and the state for his bloody intent," and so died.

Jesuit evidence describes Fawkes as a man "of great piety, of exemplary temperance, of mild and cheerful demeanor, an enemy of broils and disputes, a faithful friend," and asserts that his society was sought by all the most distinguished in the archduke's camp for nobility and virtue. There seems to be no doubt that he had qualities which under a different rule would have carried him to honor instead of to ignominy. There is something in the whole character of his actions and undertakings in this plot which seems to imply absolute self-renunciation for the cause believed to be just. But nothing could possibly have been more disastrous to the interest of the Catholics of England. The stringency of the laws against recusants was greatly increased, and their observance more severely exacted. The 5th November was ordered to be kept as a day of thanksgiving for ever, by an Act which was not repealed for over two centuries. The festivities which were long common on what is called Guy Fawkes's day are now perhaps dying out. The custom was to dress up an absurd figure in rags with a tall cap and a lantern, to parade with this through the streets singing rhymes, and finally at night to burn the effigy. This holocaust was in some places an important annual ceremony, presided over by the local officials.

The question as to the part taken by the Jesuits in the Gunpowder Plot has been a much debated one. There seems to be no doubt that Garnet, the superior of the order in England, had a guilty knowledge of the plot, if he did not even actively encourage it. He was tried and condemned March 28 and executed May 3, 1606.

Many valuable letters and memorials connected with this plot are preserved in the Public Record Office. The anonymous letter to Lord Monteagle and the reports of Fawkes's various examinations are there, as well as the reports of the examinations of Winter and other conspirators, supposed conspirators, suspected persons, and persons in any way connected with them. These were some years ago collected and bound in a volume called the *Gunpowder Plot Book*. They are not, however, separately calendared in the published series of calendars, but are noticed chronologically with the other papers. Winwood's *Memorials* contain valuable letters from Cecil and others to Sir C. Cornwallis about the plot, from the Cotton Library. See *Fawkeses of York in the Sixteenth Century*, and Jardine's *Narrative of the Gunpowder Plot*.

FAXARDO. See SAAVEDRA.

FAY, ANDRÁS (1786–1864), Hungarian poet and author, born 30th May, 1786, at Kohány, in the county of Zemplin, was educated for the legal profession at the Protestant college of Sárospatak. Being, however, subsequently obliged to abandon the law as a vocation on account of ill-health, he devoted himself to literary pursuits, and became one of the best writers of Hungarian narrative prose. His *Mesék* (*Fables*), the first edition of which appeared at Vienna in 1820, evinced his powers of satire and invention, and won him the well-merited applause of his countrymen. These fables, which, on account of their originality and simplicity, have caused Fáy to be regarded as the Hungarian Æsop, were translated into German by Petz, Raab, 1825, and partly into English by E. D. Butler, *Hungarian Poems and Fables*, London, 1877. Fáy wrote also numerous poems, the chief of which are to be found in the collections *Bokréta* (*Nosegay*), Pesth, 1807, and *Fris Bokréta* (*Fresh Nosegay*), Pesth, 1818. He also composed several plays and romances and numerous tales, busying himself through the whole of his career with every kind of literary work. In the year 1835 Fáy was elected representative for the county of Pesth, in the Hungarian diet, where he became for a time the leader of the opposition party; and, though afterwards eclipsed by Kossuth, he still continued to distinguish himself both by his liberal sentiments and by his unremitting efforts for the material internal progress of the nation. It is to him that the Pesth Savings Bank owes its origin, and he was one of the chief founders of the Hungarian National Theatre. He died on the 26th July, 1864. His earlier works were published in a collective form at Pesth, 1843–44, 8 vols. The most noteworthy of his later works is a humorous novel entitled *Jávor orvos és Bakator Ambrus szolgáia* (*Jávor the Doctor and his servant Ambrose Bakator*), Pesth, 1855, 2 vols.

FAYAL. See AZORES, vol. iii. p. 149.

FAYETTEVILLE, a town of the United States, capital of Cumberland co., North Carolina, is situated on Cape Fear River, 100 miles N.W. of Wilmington. It has cotton manufactures, and, on account of the large pine forests in its neighborhood, a considerable trade in timber, tar, and turpentine. It was settled in 1762, received its present name in 1784, was partly destroyed by fire in 1831, and was taken by the Union army in March, 1865. Population in 1870, 4660, of whom 2318 were colored.

FAYOUM, or Feiyoom. See Egypt, vol. vii. p. 671.

FEA, Carlo (1753–1834), an Italian archæologist, was born at Pigna in Piedmont, 2d February, 1753. At an early age he went to Rome, where he prosecuted his studies with a view to the legal profession, under the superintendence of his uncle, who was a distinguished ecclesiastic. He received the degree of doctor of laws from the university of La Sapienza, and for some time practised as an advocate; but archæology gradually came to occupy his chief attention, and with the view of obtaining better opportunities for his antiquarian researches he in 1798 took orders. As a member of the Archæological Society of Rome, Fea gave considerable aid to the antiquarian researches carried on under its auspices. He was also librarian to Prince Chigi. He died at Rome 18th March, 1834.

Fea revised, with the addition of notes, an Italian translation of Winckelmann's *Geschichte der Kunst*, and also added notes to some of Bianconi's works. Among his own works the principal are—*Miscellanea filologica, critica, e antiquaria; L'integretà del Panteon rivendicata a M. Agrippa; Frammenti di fasti consolari; Iscrizioni di monumenti pubblici;* and *Descrizione di Roma.*

FEARNE, Charles (1749–1794), an eminent writer on law, son of Charles Fearne, judge-advocate of the Admiralty, was born in London in 1749, and was educated at Westminster School. He adopted the legal profession, but, though well fitted by his talents to succeed as a barrister, he neglected his business and devoted most of his attention and his patrimony to the prosecution of scientific experiments, with the vain hope of achieving discoveries which would reward him for his pains and expense. He died in 1794, leaving his widow and family in necessitous circumstances. His *Essay on the Learning of Contingent Remainders and Executory Devices*, the work which has made his reputation as a legal authority, was called forth by a decision of Lord Mansfield in the case of Perrin *v.* Blake, and had the effect of reversing that decision. The 10th edition of this essay (1844) contains the notes added by Charles Butler to the 6th edition, with additions by Charles W. Smith. A volume entitled *Fearne's Posthumous Works* was published by subscription in 1797 for the benefit of his widow.

FEASTS. See Festivals.

FEATHERS. The scientific definition of the various parts of a feather will be found in the article Bird (vol. iii. p. 630). Here cognizance is taken of the purposes only to which feathers are applied either for use or ornament. These applications are numerous and varied, arising, as they do in some cases, from the physical properties of the quill, and again from the structure and elasticity of the vane; while for ornamentation, sometimes beauty of form, and oftener brilliancy of color, are the qualities which commend different feathers for use. The chief purposes for which feathers become commercially valuable may be comprehended under four divisions:—1st, bed and upholstery feathers; 2d, quills for writing; 3d, ornamental feathers; and 4th, miscellaneous uses of feathers.

Bed and Upholstery Feathers.—The qualities which render feathers available for stuffing beds, cushions, etc., are lightness, elasticity, freedom from matting, and softness. These are combined in the most satisfactory degree in the feathers of the goose and of several other allied aquatic birds whose bodies are protected with a warm downy covering. Goose feathers and down, when plucked in spring from the living bird, are most esteemed, being at once more elastic, cleaner, and less liable to taint than those obtained from the bodies of killed geese. The down of the eider duck, *Anas mollissima*, is esteemed above all other substances for lightness, softness, and elasticity; but it has some tendency to mat, and is consequently more used for quilts and in articles of clothing than unmixed for stuffing beds. The feathers of swans, ducks, and of the common domestic fowl are also largely employed for beds; but in the case of the latter bird, which is, of course, non-aquatic, the feathers are harsher and less downy than are those of the natatorial birds generally. Feathers which possess strong or stiff shafts cannot, without some preliminary preparation, be used for stuffing purposes, as the stiff points they present would not only be highly uncomfortable, but would also pierce and cause the escape of the feathers from any covering in which they might be enclosed. The barbs are therefore stripped or cut from these feathers, and when so prepared they, in common with soft feathers and downs, undergo a careful process of drying and cleaning, without which they would acquire an offensive smell, readily attract damp, and become a refuge for vermin. The drying is generally done in highly heated apartments or stoves, and subsequently the feathers are smartly beaten with a stick, and shaken in a sieve to separate all dust and small débris. Bed feathers come to the British market most largely from Germany; in Russia geese are kept almost exclusively on account of their feathers and quills; and from that country as well as France large quantities of goose and other upholstery feathers are obtained. The fine down of the eider duck obtained from high latitudes, as already mentioned, is principally consumed in bed quilts and for down-quilted articles of ladies' attire.

Quills for Writing.—The earliest period at which the use of quill feathers for writing purposes is recorded is the 6th century; and from that time till the introduction of steel pens in the early part of the present century they formed the principal writing implements of civilized communities. It has always been from the goose that quills have been chiefly obtained, although the swan, crow, eagle, owl, hawk, and turkey all have more or less been laid under contribution. Swan quills, indeed, are better and more costly than are those from the goose, and for fine lines crow quills have been much employed. It is only the five outer wing feathers of the goose that are useful for writing, and of these the second and third are the best, while left-wing quills are also generally more esteemed than those of the right wing, from the fact that they curve outward and away from the writer using them. Quills obtained in spring, by plucking or otherwise, from living birds are by far the best, those taken from dead geese, more especially if fattened, being comparatively worthless. To take away the natural greasiness, to remove the superficial and internal pellicles of skin, and to give the necessary qualities of hardness and elasticity, quills require to undergo some processes of preparation. The essential operation consists in heating the quills, generally in a fine sand-bath, to from 130° to 180° Fahr. according to circumstances, and scraping them under pressure while still soft from heat, whereby the outer skin is removed and the inner shrivelled up. If the heating has been properly effected, the quills are found on cooling to have become hard, elastic, and somewhat brittle. While the quills are soft and hot, lozenge-shaped patterns, ornamental designs, and names are easily and permanently impressed on them by pressure with suitable instruments or designs in metal stamps.

Ornamental Feathers.—Feathers do not appear to have been much used, in Europe at least, for ornamental purposes till the close of the 13th century. They are found in the conical caps worn in England during the reigns of Edward III. and Richard II.; but not till the period of Henry V. did they take their place as a part of military costume. Towards the close of the 15th century the fashion of wearing feathers in both civil and military life was carried to an almost ludicrous excess. In the time of Henry VIII. they first appeared in the bonnets of ladies; and during Elizabeth's reign feathers began to occupy an important place as head-dress ornaments of women. From that time down to the present, feathers of endless variety have continued to be leading articles of ornamentation in female head-attire; but, except for military plumes, they have long ceased to be worn in ordinary male costume. At the present day it is scarcely too much to say that all feathers of all birds are, in one way or other, turned to account by ladies for the purpose of personal ornament. Ostrich feathers, however, hold, as they have always held, a pre-eminent position among ornamental feathers; and the ostrich is the only bird which may be said to be reared exclusively for the sake of its feathers. Ostrich farming is now recognized as one of the established industries of South Africa. On these farms the birds are hatched by artificial incubation from eggs which are valued at £5 each. The birds are estimated to be worth about £30 apiece, a fine full-grown male being valued as high as £75. The birds begin to yield feathers when about a year old, and continue to an advanced age to produce two crops of plumes annually of a present yearly average value of £15. The feathers are generally plucked from the living animal—a process which does not appear to cause any great inconvenience. In the male bird, the long feathers of the rump and wings are white, and the short feathers of the body are jet black; while the rump and wing feathers of the female are white tinged with a dusky gray, the general body color being the latter hue. The feathers of the male are consequently much more valuable than those of the female, and they are separately classified in commerce. The art of the plumassier embraces the cleaning, bleaching, dyeing, curling, and making up of ostrich and other plumes and feathers. White feathers are simply washed in bundles in hot soapy water, run through pure warm water, exposed to sulphurous fumes for bleaching, thereafter blued with indigo solution, rinsed in pure cold water, and hung up to dry. When dry the shafts are pared or scraped down to give the feathers greater flexibility, and the barbs are curled by drawing them singly over the face of a blunt knife or by the cautious application of a heated iron. Dull-colored feathers are usually dyed black with logwood and sulphate or acetate of iron. Feathers which are dyed light colors are first bleached by exposure in the open air, and the dyes employed are the same as those for other animal substances. Much ingenuity is displayed in the making up of plumes, with the general result of producing the appearance of full, rich, and long feathers from inferior varieties and from scraps and fragments of ostrich feathers; and so dexterously can factitious plumes be prepared that only an experienced person is able to detect the fabrication.

To enumerate all the feathers used for ornamental purposes would be practically to give a complete list of all known and obtainable birds; but there are a few in addition to those of the ostrich which form steady articles of commercial demand. Among these are the feathers of the South American ostrich, *Rhea americana*, the marabout feathers of India obtained from *Leptoptilos argala* and *L. javanica*, the feathers of the various species of birds of paradise, and of numerous species of humming-birds. Swan-down and the skins of various penguins and grebes and of the albatross are used, like fur, for muffs and collarettes.

The Chinese excel in the preparation of artificial flowers and other ornaments from bright natural-colored or dyed feathers; and the French also skilfully work fragments of feathers into bouquets of artificial flowers, imitation butterflies, etc.

Miscellaneous Applications of Feathers.—Quills of various sizes are extensively employed as holders for the sable and camel hair brushes used by artists, etc. Feather brushes and dusters are made from the wing-feathers of the domestic fowl and other birds; those of a superior quality, under the name of vulture dusters, being really made of American ostrich feathers. A minor application of feathers is found in the dressing of artificial fly-hooks for fishing. As steel pens came into general use it became an object of considerable importance to find applications for the supplanted goose-quills; and in this quest no one was more deeply interested than M. Bardin, of Joinville le Pont near Paris, whose establishment sent out about 20,000,000 quills annually—the product of 2,000,000 geese. M. Bardin competed with the steel-pen makers by cutting several pens of the shape of metallic pens from each quill, but more largely he devoted himself to the preparation of quill tooth-picks. The cutting up of the feathers in this way leaves the shaft and barbs unused, and these he utilized in various ingenious ways,—the principal products being a kind of mat into which the barbs are woven, the shafts yielding a fibrous substance not unlike hogs' bristles, from which useful brushes are fabricated. (J. PA.)

FEBRUARY, the second month of the year. In ordinary years it contains 28 days; but in bissextile or leap year, by the addition of the intercalary day, it consists of 29 days. This month was not in the Romulian calendar. In the reign of Numa two months were added to the year, namely, January at the beginning, and February at the end; and this arrangement was continued until 452 B.C., when the decemvirs placed February after January. The ancient name of *Februarius* was derived from the verb *februaré*, to purify, or from *Februa*, the Roman festival of general expiation and lustration, which was celebrated during the latter part of this month. In February also the Lupercalia were held, and women were purified by the priests of Pan Lyceus at that festival. The most generally noted days of February are the following:—the 2d, Candlemas Day, one of the fixed quarter days used in Scotland; the 14th, St. Valentine's Day; and the 24th, St. Matthias. The church festival of St. Matthias was formerly observed on the 25th of February in bissextile years, but it is now invariably celebrated on the 24th.

FÉCAMP, a seaport-town of France, department of Seine-Inférieure, is situated on the English Channel, at the mouth of the small river Fécamp, 23 miles N.N.E. of Havre. The town consists almost entirely of one street, which is upwards of two miles in length. It occupies the bottom and sides of a narrow valley, opening out towards the sea between two high cliffs, on one of which stands a lighthouse. Its port, though small, is one of the best on the Channel, and has been greatly improved by the construction of an inner port with a fine quay. It carries on a considerable trade in Baltic and colonial produce, and in brandy and salt, and sends out vessels to the whale, cod, mackerel, and herring fisheries. In 1875 there entered the port 167 vessels, with a total tonnage of 26,321. The river affords abundant water-power for numerous cotton, oil, and other mills. Fécamp has also sugar refineries, tanneries, forges, and building docks, and manufactures of hardware, candles, and soda. The church is a large and handsome edifice; and the other principal buildings are the sea-bathing establishment, the theatre, the hospital, and the Institute for Poor Sisters. The Latin name of Fécamp was Fiscarium or Fiscanium; and the town owes its origin to a nunnery which was founded in 664, destroyed by the Normans in 841, and rebuilt for a Benedictine abbey by Richard I., duke of Normandy, in 998. The population in 1872 was 12,651.

FECKENHAM, or FECKNAM, JOHN DE, the last abbot of Westminster, was born of poor parents in Feckenham Forest in Worcestershire. The family name was Howman; and it is noted by Fuller (*Worthies of England*) that the abbot was the last clergyman who was "locally surnamed." He was of good parts and fond of learning; and, after receiving instruction from the parish priest, he was sent to the Benedictine monastery of Evesham, whence, at about the age of eighteen, he passed to Gloucester College, Oxford. He afterwards returned to Evesham, and there remained till the dissolution of the monastery in 1536, when he received a pension of a hundred florins. Resuming his studies at Oxford, he took in 1539 his degree of B.D. He was successively chaplain to Bell, bishop of Worcester, and to Bonner, bishop of London. When the latter was deprived of his see (1549), Feckenham was committed to the Tower. His learning and eloquence, however, made him so weighty an advocate that he was temporarily liberated ("borrowed from the Tower," he says in old English phrase) for the purpose of holding discussions on the points in dispute between Romanists and Protestants. Among these disputations were four with Hooper, bishop of Worcester. Remanded to the Tower, he was released at the accession of Queen Mary and became her chaplain. In rapid succession he was appointed chaplain to Bishop Bonner and prebendary and dean of St. Paul's. He was sent to Lady Jane Grey two days before her execution to commune with her, and "to reduce her," says Fox, "from the doctrine of Christ to Queen Mary's religion;" and two months later he was one of the disputants at Oxford against Cranmer, at the martyrdom of Ridley and Latimer. He showed, however, no eagerness of hostility to the martyrs; and indeed throughout Queen Mary's reign he distinguished himself by generous endeavors in behalf of the persecuted reformers. He also pleaded earnestly for the release of the Lady Elizabeth, thereby offending the queen. In May, 1556, the degree of D.D. was conferred upon him by the university of Oxford; and in September following he was made abbot of Westminster, fourteen Benedictine monks being placed under him. Queen Elizabeth on her accession (1558) sent for the abbot and offered him, it is said, the archbishopric of Canterbury, but he could not conform to the new faith. He sat in her first parliament, and was the last mitred abbot that was seen in parliament. His influence there was steadfastly directed against all movements of reformation. In 1560 he was sent to the Tower, and, with intervals of freedom, remained in confinement more or less strict for the rest of his life. He died in Wisbeach Castle, in the Isle of Ely, in 1585. Among the few pieces published by Feckenham are the *Conference-Dialogue* held between the Lady Jane Grey and himself, and several funeral orations or sermons.

FEDCHENKO, ALEXIS PAULOWITCH (1844–1873), a Russian naturalist and traveller, well known for his explorations in Central Asia. He was born at Irkutsk, in Siberia, on 7th February, 1844; and, after attending the gymnasium of his native town, proceeded to the university of

Moscow, for the study more especially of zoology and geology. In 1868 he travelled through Turkestan, the district of the lower Sír-Darya, and Samarcand; and shortly after his return he set out for Khokand, where he visited a large portion of territory till then unknown. Soon after his return to Europe he perished on Mont Blanc while engaged in an exploring tour in Switzerland, 15th September, 1873.

Accounts of the explorations and discoveries of Fedchenko have been published by the Russian Government,—his *Journeys in Turkestan* in 1874, *In the Khanat of Khokand* in 1875, and *Botanical Discoveries* in 1876. See Petermann's *Mittheilungen*, 1872–74.

FEDERAL GOVERNMENT. A federal union of sovereign states for mutual aid, and the promotion of interests common to all, is a procedure so consistent with self-interest that examples of it can be adduced from very early times. Had a federal union of Hellenic states been effected at the close of the Persian war, results would have been achieved which were vainly aimed at subsequently,—as by Athens herself, after the capture of Olynthus by Philip of Macedon. The effort to effect a union of states for the common good then failed; but at length, in the century following the death of Alexander, the Ætolian and Achæan confederacies were formed, and a spirit of unity was inspired which, if less tardily manifested, might have long perpetuated Hellenic freedom. For the first time a federative spirit contended effectively with the isolation which had so long animated the policy of the ancient world.

Aristotle collected the constitutions of 150 governments of the time of Alexander, including many cities bounded by their own walls, and, like the mediæval republics of Italy, standing for centuries almost within sight of each other without a thought of union except by conquest of the weaker by the stronger. The Panhellenic festivals long served to perpetuate a fraternal pride in the community of Hellenic blood, but they begot no results of sustained political unity. But when Macedonian ambition raised up a military empire on their own frontier stronger and far more dangerous than that of Persia, the statesmen of Greece learned the necessity of confederation for the safety of their autonomous governments. Of the unions which followed, the two most celebrated were the Ætolian league and the confederacy of Achæans. The constitution of the Ætolian league, though democratic, included an aristocratic or privileged class. It was a league of districts rather than of cities, with chiefs of the hill tribes and leading citizens attending the annual assemblies at Thermus, and might not inaptly be compared to the Swiss confederacy of city and forest cantons. The Spartans alone compared with the Ætolians in their prolonged maintenance of the power of independent action and self-government.

The Achæan league differed from that of the Ætolians in being one of cities. Grote speaks of it as never attaining to anything better than a feeble and puny life. But it gave good evidence of the benefits of federation. From remote times twelve towns had acknowledged confederate rights and obligations; in 275 B.C. other cities joined; and the importance of the confederacy continued to increase till 251 B.C., when Aratus became strategus, and brought his native Sicyon into the union. Upwards of seventy cities, while still controlling their own local affairs, were by this means associated under one federal government. The federal capital was at Ægium, and each city sent deputies annually thither till 194 B.C., when Philopœmen introduced the system of meeting by rotation in the principal cities, a procedure originating in jealousy, and the inevitable source of weakness.

Among the later European confederations the Swiss republic attracts most attention. As now constituted it consists of twenty-two sovereign states or cantons. The government is vested in two legislative chambers, a senate or council of state, and a national council, constituting unitedly the federal assembly. The executive council of seven members elects the president and vice-president for a term of three years. Before the French Revolution the German empire was a complex confederation, with the states divided into electoral colleges, consisting—(1) of the ecclesiastical electors and of the secular electors, including the king of Bohemia; (2) of the spiritual and temporal princes of the empire next in rank to the electors; and (3) of the free imperial cities. The emperor was elected by the first college alone. This imposing confederation came to an end by the conquests of Napoleon; and the Confederation of the Rhine was established in 1806 with the French emperor as protector. But its principles were violated by its so-called protector, and in 1815 the Germanic confederation was established by the Congress of Vienna, which in its turn has been displaced by the present German empire. This, in its new organization, has conferred on Germany the long-coveted unity and coherence the lack of which had been a source of weakness. The constitution dates, in its latest form, from the treaties entered into at Versailles in 1871. A federation was then organized with the king of Prussia as president, under the hereditary title of emperor of Germany. Delegates of the various confederated Governments form the Bundesrath; the Reichstag, or popular assembly, is directly chosen by the people; and the two assemblies constitute the federal parliament. This body has power to legislate for the whole empire in reference to all matters connected with the army, navy, postal service, customs, coinage, etc., all political laws affecting citizens, and all general questions of commerce, navigation, passports, etc. The emperor represents the confederacy in all international relations, with the chancellor as first minister of the empire, and has power, with consent of the Bundesrath, to declare war in name of the empire.

The United States of America more nearly resembles the Swiss confederacy, though retaining marks of its English origin. The original thirteen States were colonies wholly independent of each other. By the Articles of Confederation and Perpetual Union between the United States of America, drawn up by Congress in 1777, the States bound themselves in a league of common defence; a common citizenship was recognized for the whole union; but each State reserved its sovereignty along with every power not expressly delegated to Congress, and the jealousy in regard to States' rights has never been entirely laid aside. The theory of the confederacy is that of a federal republic formed by the voluntary union of sovereign States. The powers of the central government are determined by a written constitution, and are intrusted to three distinct authorities—executive, legislative, and judicial. The president, elected for a term of four years by electors chosen for that purpose by each State, is the representative head of the republic. The vice-president, *ex-officio* president of the senate, assumes the presidency in case of resignation or death. Legislative power is vested in the senate, composed of two members elected by each State for a term of six years; and in the Congress, consisting of representatives in numbers proportionate to the population of each State, holding their seats for two years. The supreme judicial authority, which forms the final court of appeal on all constitutional as well as legal questions, consists of a chief justice and eight judges, appointed for life by the president, subject to confirmation by the senate.

The essential principle involved in confederation is that it is a union of sovereign states. With a view to the common interests of all, they agree to abrogate certain functions of sovereignty in their separate capacity, in order that these shall be jointly exercised for the common good by the body which they concurrently vest with such sovereign functions; but all other sovereign rights are reserved. This differs essentially from the incorporation of two or more states into a united commonwealth, as in the union of England and Scotland. The new empire of Germany illustrates the former, the new kingdom of Italy the latter. In view of the sovereign rights reserved by the several members of a federal union of states, each may be presumed to have the right to withdraw from the confederation. State rights, including that of secession, were strongly asserted during the civil wars between the northern and southern States of America; but the result has naturally been to subordinate the will of individual States to the higher interests of the confederacy as a whole. The written constitution of the United States is subject to amendment at any time, by consent of two-thirds of both representative bodies; or by a convention specially called by the legislatures of two-thirds of the several States for the purpose.

The extension of responsible constitutional government by Great Britain to her chief colonies, under a governor or viceregal representative of the crown, has been followed in British North America by the union of the Canadian, maritime, and Pacific provinces under a federal government,—with a senate, the members of which are nominated by the crown, and a house of commons elected by the different provinces according to their relative population.

The governor-general is appointed by the crown for a term of seven years, and represents the sovereign in all matters of federal government. The lieutenant-governors of the provinces are nominated by him; and all local legislation is carried on by the provincial parliaments. The remarkable confederation of the Dominion of Canada, which has thus originated, presents the unique feature of a federal union of provinces practically exercising sovereign rights in relation to all local self-government, and sustaining a constitutional autonomy, while cherishing the colonial relationship to Great Britain. History has no parallel to this novel fact of a free people, the occupants of vast regions stretching from the Atlantic to the Pacific, enjoying all constitutional rights, electing their own parliaments, organizing an armed militia, controlling customs, emigration, and all else that pertains to independent self-government, while they continue to cherish the tie which binds them to the mother country, and to render a loyal homage to the representative of the crown. The harmonious relations resulting from this application of the system of federal government to the British American provinces has suggested the extension of the same principle to the colonies of South Africa, and may be regarded as the basis of a colonial system by means of which the vast colonial dependencies of Great Britain may perpetuate their relations with the mother country, while enjoying all the blessings of its well-regulated freedom, or may be trained to emulate its example as independent states. (D. W.)

FEDERICI, Camillo (1749–1802), Italian dramatist and actor, was born at Garessio, a small town in Piedmont, April 9, 1749. His real name was Giovanni Battista Viassolo, and that by which he is now known and which he transmitted to his children was taken from the title of one of his first pieces, *Camillo e Federico*. He was educated at Turin, and showed at an early age a great fondness for literature and especially for the theatre. The praises bestowed on his early attempts determined his choice of a career, and he obtained engagements with several companies both as writer and actor. He made a happy marriage in 1777, and soon after left the stage and devoted himself entirely to composition. He settled at Padua, and the reputation of his numerous comedies rapidly spread in Italy, and for a time seemed to eclipse that of his predecessors. Most of his pieces were of the melodramatic class, and he too often resorted to the same means of exciting interest and curiosity. He caught, however, something of the new spirit which was manifesting itself in German dramatic literature in the works of Schiller, Iffland, and Kotzebue, and the moral tone of his plays is generally healthy. Fortune did not smile upon him; but he found a helpful friend in a wealthy merchant of Padua, Francis Barisan, for whose private theatre he wrote many pieces. He was attacked in 1791 with a dangerous malady which disabled him for several years; and he had the misfortune to see his works, in the absence of any copyright law, published by others without his permission. At length, in 1802, he undertook to prepare a collected edition; but of this four volumes only were completed when he was again attacked with illness, and died at Padua (December 23). The publication of his works was completed in 14 volumes in 1816. Another edition in 26 volumes was published at Florence in 1826–27. A biographical memoir of Federici by Neymar appeared at Venice in 1838.

FEE (*feodum*), in English law, signifies an estate of inheritance (*i.e.*, an estate descendable to the heirs of the grantee so long as there are any in existence), as opposed to an estate for life. In a more primary sense it means an estate by tenure (land holden of a lord) as opposed to land owned allodially. See Digby's *History of the Law of Real Property*, p. 50, and the article Estate.

FEHMIC COURTS (Fehmgerichte or Vehmgerichte), celebrated secret tribunals which flourished in Germany from the end of the twelfth century to the middle of the 16th, and which, from the extent of their organization and the mystery which surrounded their proceedings, inspired a feeling of dread in all who came within their jurisdiction. Their origin is uncertain. The traditional account is that they were instituted by Charlemagne and Pope Leo III. to prevent the Saxons from relapsing into paganism. It is more probable that they arose from the relics of the ancient Teutonic free courts. Their immediate cause, however, is to be found in the utter lawlessness and disregard of authority then prevailing in Germany, which obliged the weak and the peace-loving to band themselves together as protection against the outrages of the princes and nobles. The birthplace of the Fehmic courts was Westphalia, where they appeared shortly after the deposition of Henry the Lion in 1179. The duchy was in consequence of this event annexed to the archbishopric of Cologne, and the archbishops appear to have had a good deal to do with the origination of the courts. Fehmic courts subsequently made their way into most other parts of Germany, but the institution never seems to have succeeded in gaining a firm footing outside the limits of Westphalia, or the Red Land, as it was called. Within this district, however, which included nearly the entire country between the Rhine and the Weser, they soon acquired an immense power, which was at first used only in a beneficial and upright manner, supplying a means of redress at a time when the public administration of justice was in abeyance. But in the end, as might have been anticipated, the secrecy of their proceedings and the arbitrary nature of their rules converted them into an instrument of tyranny in the hands of the very persons whose lawless deeds they were designed to suppress. The emperors themselves, who had at first encouraged the Fehmic courts, finding them a useful means of keeping their feudal dependants in check, were unable directly to resist their encroachments; and it was only with the restoration of public order and the establishment of a regular judicature that the influence of the Fehmgerichte gradually waned. The last regular court is said to have been held at Celle, in Hanover, in 1568; but there are traces of the institution at a much later date; and in the present century even, a relic of the once famous Fehmgerichte was to be found in Westphalia in the form of a society for the suppression of vice. It was abolished by order of Jerome Bonaparte in 1811.

It was necessary that a candidate for initiation into the Fehm should be born in wedlock, that he should be a Christian, and neither excommunicated nor outlawed, and that he should not be a party to any process before a Fehmic court. Originally only natives of Westphalia were admitted. At initiation the candidate took a solemn oath to support with his whole powers the Holy Fehm, to conceal its proceedings "from wife and child, father and mother, sister and brother, fire and wind, from all that the sun shines on and the rain wets, and from every being between heaven and earth," and to bring before the tribunal everything within his knowledge that fell under its jurisdiction. He was then initiated into the signs by which the members recognized each other, and was presented with a rope and a knife, upon which were engraved the mystic letters S.S.G.G., whose signification is still involved in doubt, but which are supposed to mean *Strick, Stein, Gras, Grein*. The emperor was the nominal head of the Fehmic courts. Under him the supreme president was the archbishop of Cologne as duke of Westphalia. The whole country over which the jurisdiction of the Fehmic courts extended was divided into districts, in each of which there was at least one court presided over by a judge called a Freigraf, or free count. Along with him sat an indefinite number of assessors, but never less than seven, called Freishöffen, or Freischöppen, in Latin *scabini*. These Freischöffen had the duty of bringing complaints before the courts, and of carrying into execution the sentences which were pronounced. There were two distinct sorts of Fehmic courts,—one which held its sittings openly, and another whose proceedings were conducted in secret. The open court, in one of its branches, exercised a jurisdiction in civil suits and over offences of a trifling description, in which cases it was unnecessary that either plaintiff or defendant should be a member of the Fehm. The other branch of the open court took cognizance of all crimes of an ordinary nature. The accuser was always one of the Freischöffen. The accused was cited by nailing the summons during night to the door of his house, or, if it was not known where he lived, by fixing four copies upon a post at cross roads near his supposed abode. If the accused appeared, the accuser stated the case, and the investigation proceeded by the examination of witnesses as in an ordinary court of law. The judgment was put into execution on the spot if that was possible. The secret court, from whose procedure the whole institution has acquired its evil character, was closed to all but the initiated; any one not a member on being discovered was instantly put to death, and the members present were bound under the same penalty not to disclose what took place. Crimes of a serious nature, and especially those that were deemed unfit for ordinary judicial investigation—such as heresy and witchcraft—fell within its jurisdiction, as also did appeals by persons condemned in the open courts, and likewise the cases before those tribunals in which the accused had not appeared. The accused if a member could clear himself by his own oath, unless he had revealed the secrets of the Fehm. If he were one of the uninitiated it was necessary for him to bring forward witnesses to his innocence from among the initiated, whose number varied according to the number on the side of the accuser, but twenty-one in favor of innocence necessarily secured an acquittal. The only punishment which the secret court could inflict was death. If the accused appeared, the sentence was carried into execution at once; if he did not appear, it was quickly made known to the whole body, and the Freischöffe who was the first to meet the condemned was bound to put him to death. A knife with the cabalistic letters was left beside the corpse to show that the deed was not a murder.

See Wigand, *Das Fehmgericht Westphalens*, 1825, and Usener, *Die Frei und Heimlichen Gerichte Westphalens*, 1832; also Scott's *Anne of Geierstein*, introduction and chap. xx. (H. J. E. F.)

FEITAMA, Sybrand (1694–1758), a Dutch author, was born at Amsterdam, December 10, 1694. He was originally intended for the ministry, but eventually adopted a commercial career. In middle life, having made a sufficient fortune, he retired from business, and dedicated his remaining years to literature, and to a circle of friends that included all the most eminent of his younger contemporaries. In 1733 he published his translation of *Télémaque*, to which he had given twenty years of revision. In 1735 appeared two volumes of his *Stage Poems*, original dramas for reading rather than acting. In 1743 was issued the first draft of his translation of the *Henriade*, in perfecting which he spent nearly a quarter of a century. Three volumes of his *Posthumous Poems* appeared in 1764. He died at Amsterdam on the 3d of June, 1758. The influence of Feitama over Dutch literature was very extensive and very pernicious. He was a cold and rhetorical versifier, a learned trifler, and hopelessly wedded to the French tradition. His two great translations, which are indeed admirably performed from his own standpoint, have long outlived their immense popularity in the last century.

FEITH, Rhijnvis (1753–1824), a Dutch poet, was of aristocratic extraction, and was born at Zwolle, the capital of the province Overijssel, on the 7th of February, 1753. It has been said with truth that his whole life was a model of social, personal, and literary good fortune; there has never lived a poet who enjoyed more unbroken prosperity. This is the more noticeable, because of all the important writers of Holland he is the one whose works are most full of melancholy and despair. He was educated at the universities of Harderwijk and Leyden, and took his degree at the latter in 1770. In 1772 he settled at his birthplace, and married. In 1780, in his twenty-seventh year, he became burgomaster of Zwolle, a post which he held for the remainder of his life. He built a luxurious villa, which he named Boschwijk, in the outskirts of the town, and here he lived in the greatest comfort. His first important production was *Julia*, in 1783, a novel written in emulation of *Werther*, and positively steeped in *Weltschmerz* and despair. This was followed in 1784 by the tragedy of *Thirsa*, the first of his dramatic poems. The next year was one of great mark in Feith's career: he published *Ferdinand and Constantia*, another Werther novel, and *The Patriots*, a tragedy. Both were very successful, and his poems were publicly crowned at Leyden. He was now the most popular poet in Holland, and this fact, combined with his burning patriotism, drew upon him the hatred of Bilderdijk. Other writers attacked his morbid melancholy, and in 1786 the critic Baron van Perponcher made a trenchant assault on him in a work on sentimentality. He was accordingly silent for some time, but in 1791 he printed a tragedy of *Lady Johanna Gray;* and in 1792 there appeared a portentous didactic poem, *The Grave*, in four cantos, which belongs to the most tearful school of churchyard poetry. In 1793 and in 1795 he produced his tragedies of *Ines de Castro* and *Mucius Cordus*, the first taken from an episode in the *Lusiad*, the second composed in honor of the Batavian republic. From 1796 to 1814 appeared five volumes of *Odes and Miscellaneous Poems*. In 1802 he published another didactic poem, *Old Age*, in six cantos, and in 1804 *Poems for Public Worship*. He died on the 6th of February, 1824. The next year a statue of the poet, the work of Gabriel, was erected in Zwolle, and an edition of his poetical works issued in thirteen volumes. As one of the most prominent members of the revival of Dutch letters, and as a fluent and careful verse-writer, Feith will always be honorably remembered. His own age accounted him one of the greatest of poets, but posterity has refused to indorse this judgment. His romantic inspiration was borrowed from Germany, and he did not hesitate to imitate Goethe, Wieland, and Novalis. It must be recollected, however, that these men were his immediate contemporaries, and that he showed great alacrity and acumen in perceiving the modern direction of their genius.

FEJÉR, Gyorgy (1766–1851), one of the most indefatigable Hungarian authors of the last generation, was born on the 23d April, 1766, at Kescthely, in the county of Zala. After finishing his scholastic course at the gymnasium he went to Pesth, where he attended the philosophical lectures at the university. From 1785 to 1790 he studied theology at Pressburg, after which he was engaged for some time as a private family tutor. From 1802 to 1804 he taught dogmatic theology at Stuhlweissenburg, where he for many years officiated as priest; and in 1808 he obtained a theological professorship at Pesth university. Ten years later (1818) he became chief director of the educational circle of Raab, and in 1824 was appointed librarian to the university of Pesth. Fejér was the most prolific of Hungarian authors,—his works, which are nearly all written either in Latin or Hungarian, exceeding 180 in number. They treat of numerous subjects, and are of various sizes, from mere pamphlets to several volumes. His most important work, *Codex diplomaticus Hungariæ ecclesiasticus ac civilis*, published from 1829 to 1844, in eleven so-called tomes, really exceeds forty volumes. It consists of old documents and charters from 104 A. D. to the end of 1439, and forms an extraordinary monument of patient industry. This work and many others relating to Hungarian national history have placed Fejér in the foremost rank of Hungarian historians. He died on the 2d July, 1851. His latest works were *A Kunok eredete* (*The Origin of the Huns*), and *A politikai forradalmak okai* (*The Causes of Political Revolutions*), both published in 1850. The latter production, on account of its liberal tendencies, was suppressed by the Austrian Government.

See *Magyar Irók: Életrajz-gyüjtemény*, Pesth, 1856, and *A magyar nemzeti irodalomtörténet vázlata*, Pesth, 1861.

FELDKIRCH, the chief town of the Vorarlberg district of Tyrol in Austria, is situated at the junction of the valley of the Ill with the valley of the Rhine, about 6½ miles above the confluence of the two rivers. The position is one of much natural beauty and also of great military strength; and the town has consequently been of far more importance than is indicated by its size. It is the seat of a number of administrative offices, the residence of a bishop, and the centre of a considerable transit trade. Among its own industries are cotton-spinning, weaving, bell-founding, copper-smithery, engineering, coopering, and the manufacture of *Kirschwasser*. The principal buildings are the parish church (which dates from 1487 and possesses a Descent from the Cross assigned to Holbein), a Capuchin monastery and church, a Jesuit seminary (the *Stella Matutina*, or Morning Star), a charity hospital with bathing establishment attached, and the *Kurhaus* with its park. To the east of the town lie the ruins of the castle of Schattenburg, and about a mile to the south begins the territory of the prince of Lichtenstein. Feldkirch, or rather Schattenburg, was at one time the seat of the counts of Montfort, but in 1377 it was sold by Count Rudolph VII. to the dukes of Austria. In 1799 the Feldkirch pass was the scene of an indecisive conflict between the Austrians under Hotze and Jellalich and the French under Oudinot and Massena; and in 1805 the Austrian forces under Wolfskehl were obliged to capitulate in the neighborhood. The population, almost exclusively Catholic, numbered 2868 in 1869.

FÉLEGYHÁZA, chief town of the former district of Little Cumania, in Hungary, about 66 miles S.E. of Pesth, 46° 41′ N. lat., 19° 52′ E. long., is advantageously situated on the railroad between Pesth and Szegedin. Amongst the principal edifices are a fine town-hall, a Roman Catholic gymnasium, and a large parish church. The surrounding country is covered with vineyards, fruit-gardens, and tobacco and corn fields, which are the principal source of employment to the inhabitants; but the town itself is chiefly noted for its great cattle-market. Numerous ancient Roman urns and other relics have been dug up in the vicinity of the town. In the 17th century Félegyháza was completely destroyed by the Turks, nor was it recolonized and rebuilt till 1743. The population, by the latest census (December 31, 1869), amounted to 21,313, chiefly Roman Catholics and by nationality Magyars.

FÉLIBIEN, ANDRÉ (1619-1695), Sieur des Avaux et de Javercy, French architect and historiographer, was born at Chartres in May, 1619. At the age of fourteen he went to Paris to continue his studies; and in 1647 he was sent to Rome in the capacity of secretary of embassy to the Marquis de Marueil. His residence at Rome he turned to good account by diligent study of its ancient monuments, by examination of the literary treasures of its libraries, and by cultivating the acquaintance of men eminent in literature and in art. Amongst these especially to be noted was Nicholas Poussin, whose friendship and counsels were of great value to him. On his return to France he married, and was ultimately induced, in the hope of employment and honors, to settle at Paris. Colbert, the great minister, recognized his abilities; and he was one of the first members (1663) of the Academy of Inscriptions. Three years later Colbert procured him the appointment of historiographer to the king. In 1671 he was named secretary to the newly founded Academy of Architecture, and in 1673 keeper of the cabinet of antiques in the palace of Brion. To these offices was afterwards added by Louvois that of deputy controller-general of roads and bridges. Félibien found time in the midst of his official duties for study and research, and produced many literary works. Among these the best and the most generally known is the *Entretiens sur les vies et sur les ouvrages des plus excellents peintres anciens et modernes*, which appeared in successive livraisons, the first in 1666, and the fifth in 1688. It was republished with several additions at Amsterdam in 1706, and again at Trévoux in 1725. Félibien wrote also *Origine de la Peinture* (1660), *Principes de l'architecture, de la sculpture, de la peinture*, etc. (1676-90), and descriptions of Versailles, of La Trappe, and of the pictures and statues of the royal residences. He edited the *Conférences* of the Academy of Painting, and translated the *Castle of the Soul* from the Spanish of St. Theresa, the *Life of Pius V.* from the Italian, etc. His personal character commanded the highest esteem, agreeing with the motto which he adopted—*Bene facere et vera dicere*. He died at Paris, June, 11, 1695.

FÉLIBIEN, DOM MICHEL (1666-1719), French historian, was a son of André, and was born at Chartres, September 14, 1666. After studying at the Collége des Bons-Enfants at Paris, he entered, at the age of sixteen, the Benedictine congregation of St. Maur. He devoted himself to a studious life, and produced in 1706 the learned *Histoire de l'Abbaye royale de Saint-Denis en France*. Drawn from original sources, and illustrated with engravings, it at once attracted attention, and made him a reputation as a scholar. He was soon after selected by Bignon, provost of the merchants of Paris, to write a history of that city, and notwithstanding his broken health he undertook the task. In 1713 he put forth his *Projet d'une histoire de la ville de Paris*, which was approved by Louis XIV. He steadily continued his labors for six years longer, but did not live to finish the work. He died at St. Germain des Près, September 25, 1719. His *History of Paris*, which was far advanced, was completed by Lobineau assisted by De Varigny, former secretary to Félibien, and was published in 5 vols. fol. in 1725 (not 1755, as stated by most of the authorities). Dom Michel was the author of several other works of less importance.

FELIX, the name of several popes.

FELIX I., a Roman by birth, succeeded Dionysius in the papal chair in December, 269. Regarding his pontificate there is little authentic information, but he is said to have given ecclesiastical sanction to the yearly celebration of the mass over the graves of the martyrs, a custom, however, which had been previously in existence; and the law regarding the consecration of churches is also ascribed to him. On account, it is said, of his having strongly supported the Christians during the persecutions under Aurelius, he was enrolled among the martyrs, his day being the 20th of May. He died in 274. A fragment of a letter to Maximus, bishop of Alexandria, in support of the doctrines of the Trinity and Incarnation against the arguments of Paul of Samosata, was in all probability written by Felix, but other three letters ascribed to him are certainly ungenuine.

FELIX II. (?), pope or antipope, was in 356 raised from the archdeaconate of Rome to the papal chair, when Tiberius was banished by the emperor Constantius for refusing to subscribe the sentence of condemnation against Athanasius. His election was contrary to the wishes both of the clergy and of the people, and the consecration ceremony was performed by certain prelates belonging to the court. In 357 Constantius, at the urgent request of an influential deputation of Roman ladies, agreed to the release of Tiberius on condition that he signed the semi-Arian creed. Constantius also issued an edict to the effect that the two bishops should rule conjointly, but Tiberius, on his entrance into Rome in the following year, was received by all classes with so much enthusiasm that Felix found it necessary to retire at once from Rome. Regarding the remainder of his life little is known, and the accounts handed down are contradictory, but he appears to have spent the most of it in retirement at his estate near Porto. He died in 365, and, on what grounds it is impossible to determine, was enrolled amongst the number of martyrs, his day being the 22d of July. In the reign of Gregory XIII. the claim of Felix to rank among the popes was discussed, and in order to discover whether any miraculous help was to be found to aid in the decision of the question, his sarcophagus was opened, when it is said the words "Pope and Martyr" were found inscribed on his body; but this supernatural testimony is in contradiction to the earlier authorities of the church.

FELIX III. (or II.) was descended from one of the most influential families of Rome, and succeeded Simplicius in the papal chair 2d March, 483. His first act was to repudiate the Henoticon, a deed of union, originating, it is supposed, with Acacius, patriarch of Constantinople, and published by the emperor Zeno with the view of allaying the strife between the Monophysites and their opponents in the Eastern church. He also addressed a letter of remonstrance to Acacius; but the latter proved refractory, and sentence of deposition was passed against him. As Acacius, however, had the support of the emperor, a schism (the first on record) arose between the Eastern and Western churches, which lasted for 34 years. Felix died in 492.

FELIX IV. (or III.), a native of Beneventum, was, on the death of John in 526, raised to the papal chair by the emperor Theodoric in opposition to the wishes of the clergy and people. His election was followed by serious riots, which were only quieted by the explanation of Theodoric that he had merely interposed his authority on account of the strifes of the ecclesiastical factions, and by his promise that in future the election should be vested in the clergy and people, although the confirmation of the emperor should also be required to render it valid. Felix, after an uneventful pontificate of four years, died in September, 530.

FELIX V. (or IV.). See AMADEUS VIII.

FELIX, of Urgel. See ADOPTIAN CONTROVERSY.

FELIX, of Valois (1127-1212), one of the founders of the monastic order of Trinitarians or Redemptionists, was born in the district of Valois, France, 19th April, 1127. Not long after he reached manhood he became a hermit in the forest of Galeresse, where he remained till his sixty-first year, when his disciple Jean de Matha suggested to him the idea of establishing an order of monks who should devote their lives to the redemption of Christian captives from the Mahometans. With this view they arrived at Rome about the end of 1197, and obtained the sanction of the pope for the establishment of the new order. On their return to France they founded the monastery of Cerfroi in Picardy, Felix remaining to govern and propagate the order, while Jean de Matha superintended the foreign journeys. A subordinate establishment was also founded by Felix in Paris near a chapel dedicated to St. Mathurin, on which account his monks were also called St. Mathurins. Felix died at Cerfroi, 4th November, 1212, and was canonized.

FELIX, ANTONIUS, a Roman procurator of Judæa, Sa-maria, Galilee, and Peræa, entered upon his office in the 11th or 12th year of the emperor Claudius. Both he and his brother Pallas were originally slaves, and, it is said, owed their freedom to Antonia, wife of the emperor, on which account it is probable that Felix received the surname Antonius. By some writers he is also called Claudius. Felix was cruel and licentious, and his accessibility to bribes led to a great increase of crime in Judæa under his government. The apostle Paul, after being apprehended in Jerusalem, was sent to be judged before Felix at Cæsarea, and so reasoned before him of righteousness, temperance, and judgment to come that Felix trembled. He nevertheless retained Paul in custody for two years, hoping that a bribe would be offered to secure his liberty, but at the end of this time Felix was succeeded in the government by Festus, and in order to gratify the Jewish people left Paul bound. On returning to Rome, Felix was accused of having taken advantage of a dispute between the Jews and Syrians of Cæsarea to slay and plunder the inhabitants, but through the intercession of his brother Pallas, who had great influence with the emperor Nero, he escaped unpunished.

FELIX, MINUCIUS. See MINUCIUS FELIX.

FELL, JOHN (1625–86), bishop of Oxford, was the son of Dr. Samuel Fell, dean of Christ Church, and was born at Longworth, in Berkshire, June 23, 1625. He passed from the free school of Thame to Christ Church College at the age of eleven, took his degree of B.A. in 1640, and three years later that of M.A. He served in the royal garrison of Oxford, and attained the rank of ensign. He afterwards took holy orders; and being ejected by the parliamentary visitors from his student's place, he lived in retirement at Oxford during the Commonwealth, privately keeping up the services of the Church of England, and administering the sacraments to many Royalists. At the Restoration he was made in rapid succession prebendary of Chichester, canon and dean of Christ Church. He had already obtained his degree of D.D., and was also chaplain to the king. In 1666 he was appointed vice-chancellor of the university, and he filled this post for several successive years. Dr. Fell set himself diligently to reform his college, to clear it of all remains of what he regarded as Puritan "hypocrisy and nonsense," to promote learning of all kinds, and to re-establish strict discipline. He did much for the improvement of the university press, therein carrying out the designs of Archbishop Laud. He zealously maintained the privileges of the university, and in so doing made himself unpopular with the townsmen. He also distinguished himself as a benefactor to the college by making and promoting many important additions to its buildings. Having shown himself a good scholar, and an earnest upholder of the Church of England, he was nominated in 1676 bishop of Oxford. He was allowed, however, still to hold his deanery of Christ Church *in commendam*. Fell, as a good Aristotelian, was alarmed at the institution and innovations of the Royal Society, and encouraged Stubbe to write against it, making very grave charges against its members. Among his numerous publications were a *Life of Dr. Henry Hammond* (1660), a Latin translation of Wood's *History and Antiquities of the University of Oxford* (1674), and a critical edition of the Greek Testament with many various readings (1675). This edition was twice reprinted at Leipsic, and at Oxford in 1703. It was followed in 1707 by the more important edition of Mill. When he had held the see of Oxford for ten years, Fell's health failed him, and anxiety about the changes attempted in the church by James II. hastened his end. He died at Oxford, July 10, 1686, and his remains were interred in the cathedral.

FELLATAHS, or FOULAHS. See AFRICA, vol. i. p. 235.

FELLENBERG, PHILIPP EMANUEL VON (1771–1844), educationist, was born 27th June, 1771, at Berne, in Switzerland. His father was of patrician family, and a man of importance in his canton, and his mother was a granddaughter of the Dutch admiral Van Tromp. From his mother and from Pfeffel, the blind poet of Colmar, he received a better education than falls to the lot of most boys, while the intimacy of his father with Pestalozzi gave to his mind that bent which it afterwards followed. In 1790 he entered the university of Tübingen, where he distinguished himself by his rapid progress in legal studies. On account of his health he afterwards undertook a walking tour in Switzerland and the adjoining portions of France, Swabia, and Tyrol, visiting the hamlets and farm-houses, mingling in the labors and occupations of the peasants and mechanics, and partaking of their rude fare and lodging. After the downfall of Robespierre he went to Paris and remained there long enough to be assured of the storm impending over his native country. This he did his best to avert, but his warnings were disregarded, and Switzerland was lost before any efficient means could be taken for its safety. Fellenberg, who had hastily raised a levy *en masse*, was proscribed; a price was set upon his head, and he was compelled to fly into Germany. Shortly afterwards, however, he was recalled by his countrymen, and sent on a mission to Paris to remonstrance against the rapacity and cruelty of the agents of the French republic. But in this and other diplomatic offices which he held for a short time, he was witness to so much corruption and intrigue that his mind revolted from the idea of a political life, and he returned home with the intention of devoting himself wholly to the education of the young. With this resolution he purchased in 1799 the estate of Hofwyl, near Bern, intending to make agriculture the basis of a new system which he had projected for elevating the lower and rightly training the higher orders of the state, and welding them together in a closer union than had hitherto been deemed attainable. For some time he carried on his labors in conjunction with Pestalozzi, but incompatibility of disposition soon induced them to separate. The scheme of Fellenberg at first excited a large amount of ridicule, but gradually it began to attract the notice of foreign countries; and pupils, some of them of the highest rank, began to flock to him from every country in Europe, both for the purpose of studying agriculture and to profit by the high moral training which he associated with his educational system. For forty-five years Fellenberg, assisted by his wife, continued his educational labors, and latterly raised his institution to the highest point of prosperity and usefulness. He died 21st November, 1844.

See Hamm, *Fellenberg's Leben und Wirken*, Bern, 1845; and Schöm, *Der Stifter von Hofwyl, Leben und Wirken Fellenberg's*.

FELLER, FRANÇOIS XAVIER DE (1735–1802), a Belgian author, was born at Brussels 18th August, 1735. In 1752 he entered a school of the Jesuits at Rheims, where he manifested a great aptitude for mathematics and physical science. He commenced his noviciate two years afterwards, and in testimony of his admiration for the apostle of India added Xavier to his surname. On the expiry of his noviciate he became professor at Luxembourg, and afterwards at Liége. In 1764 he was appointed to the professorship of theology at Tyrnau in Hungary, but in 1771 he returned to Belgium and continued to discharge his professorial duties at Liége till the suppression of the Jesuits in 1773. The remainder of his life he devoted to study, travel, and literature. On the invasion of Belgium by the French in 1794 he went to Paderborn, and remained there two years, after which he took up his residence at Ratisbon, where he died 23d May, 1802.

Feller's works exceed 120 volumes. In 1773 he published, under the assumed name Flexier de Reval (an anagram of Xavier de Feller), his *Catéchisme philosophique;* and his principal work, *Dictionnaire historique et littéraire* (published in 1781 at Liége in 8 volumes, and afterwards several times reprinted and continued down to 1848) appeared under the same name. Among his other works the most important are *Cours de morale chrétienne et de littérature réligieuse* and his *Coup d'œil sur congrès d'Ems*. The *Journal historique et littéraire*, published at Luxembourg and Liége from 1774 to 1794 in 70 volumes, was edited and in great part written by him.

FELLOWS, SIR CHARLES (1799–1860), a distinguished traveller and antiquary, was born in 1799 at Nottingham, where the family had held an ancestral estate for a considerable time. While only fourteen he drew sketches to illustrate a trip to the ruins of Newstead Abbey, which afterwards appeared on the title-page of Moore's *Life of Lord Byron*. In early youth he travelled through a great part of Britain, and in 1820 settled in London, where he proved an active member of the British Association for the advancement of science. In 1827 he distinguished himself as a traveller in Switzerland, and discovered the modern route to the top of Mont Blanc. After the death of his mother in 1832 he gave full scope to his natural bent, and passed the greater portion of each of the next ten years in Italy or Greece, or on the shores of the Levant. The numerous sketches he executed were largely used by Mr.

Murray in illustrating *Childe Harold.* In 1838 Fellows, induced by his passion for natural beauty and his preference of a simple peasant life to an artificial civilization, started for Asia Minor, where Smyrna was the centre of his travels. His explorations of parts of the interior and south led him to districts practically unknown to Europeans, and he thus discovered ruins of a number of ancient cities which existed earlier than 300 B.C. He entered Lycia and explored the Xanthus from the mouth at Patara upwards. Nine miles from Patara he discovered the ruins of Xanthus, the ancient capital of Lycia, finely situated on hills, and abounding in magnificent remains. About fifteen miles farther up he came upon the ruins of Tlos. After taking sketches of the most interesting objects, and copying a number of inscriptions, he returned to Smyrna through Caria and Lydia. Actuated by enlightened zeal, he soon brought his discoveries before European men of letters; and the publication of *A Journal written during an excursion in Asia Minor* (London, 1839) roused such strong interest in England that Lord Palmerston, at the request of the British Museum authorities, asked the English consul at Constantinople to get leave from the sultan to ship a number of the Lycian works of art. Late in 1839 Fellows, under the auspices of the British Museum, again set out for Lycia, accompanied by George Scharf, who assisted him materially in sketching. This second visit issued in the discovery of thirteen ancient cities, all enriched by works of art; and in 1841 appeared *An Account of Discoveries in Lycia, being a Journal kept during a Second Excursion in Asia Minor.* A third visit was made late in 1841, after Fellows had obtained the "firman" by personal application at Constantinople; and he and his party had the pleasure of pitching their tents under the town of Xanthus on the 30th of December. They shipped a number of works of art for England, and in the fourth and most famous expedition (1844) twenty-seven cases of marbles were dispatched for the British Museum, where they are now to be seen in the Lycian Saloon. The most noteworthy places on which the labors of Fellows cast a flood of light are Xanthus, Pinara, Patara, Tlos, Myra, and Olympus. The theatres in Lycian towns show the influence of the Greek drama among the so-called "barbarians;" and Lycian sculpture and architecture almost rival the Greek masterpieces. The arched tombs, one of which is in the British Museum, are compared by Fellows to Gothic architecture. These tombs are very common in Lycia. At Pinara, he says, "rises a singular round rocky cliff literally specked all over with tombs." For further information about Lycia compare with the works of Fellows Leake's *Asia Minor*, the *Travels in Lycia* of Spratt and Forbes, and *Description de l'Asie Mineure* by Texier. Papers on the Lycian language by Mr. Daniel Sharpe are appended to the works of Fellows. In 1844 Fellows presented to the British Museum his portfolios, accounts of his expeditions, and specimens of natural history illustrative of Lycia. In 1845 he received the order of knighthood "as an acknowledgment of his services in the removal of the Xanthian antiquities to this country." Fellows was twice married. He died in 1860.

In addition to the works above mentioned, Fellows published the following—*The Xanthian Marbles; their Acquisition and Transmission to England*, 1843; *An Account of the Ionic Trophy Monument excavated at Xanthus*, 1848; a cheap edition of his two *Journals*, entitled *Travels and Researches in Asia Minor, particularly in the Province of Lycia*, 1852; and *Coins of Ancient Lycia before the Reign of Alexander; with an Essay on the Relative Dates of the Lycian Monuments in the British Museum*, 1855.

FELO DE SE is one who commits murder upon himself. The technical conditions of murder apply to this crime; *e.g.*, "if one commits any unlawful malicious act, the consequence of which is his own death, as if attempting to kill another he runs upon his antagonist's sword, or shooting at another the gun bursts and kills himself," he is a *felo de se.* The horror inspired by this crime led to the revolting punishment of an "ignominious burial on the highway, with a stake driven through the body." This was abolished by 4 Geo. IV. c. 52, which ordered the burial of the body of a person found to be *felo de se* within 24 hours after the coroner's inquest, between the hours of 9 and 12 at night, and without Christian rites of sepulture. See SUICIDE.

FELONY. In English law crimes are divided into felonies and misdemeanors. The difference between them does not depend on their gravity as offences, nor on the amount of punishment attached to them,—it is purely historical. Felonies are those crimes which at common law brought with them after conviction forfeiture of goods. Since the Felony Act, noticed below, this is no longer an existing ground of distinction. Legal writers have sought to throw light on the nature of felony by examining the etymology of the word. One derivation suggested is from the Greek φῆλος, an impostor. Others connect it with the Latin verb *fallo.* Coke says it is *crimen animo felleo perpetratum* (a crime committed with malicious or evil intent). Spelman connects it with the word *fee*, signifying fief or feud; and felony in this way would be equivalent to *pretium feudi*, an act for which a man lost or gave up his fee (see Stephen's *Blackstone*, vol. iv. p. 7). And it appears that acts involving forfeiture were styled felonies in feudal law, although they had nothing of a criminal character about them. A breach of duty on the part of the vassal neglect of service, delay in seeking investiture, and the like were felonies. Injuries by the lord against the vassal were also felonies. In course of time felonies came to mean capital crimes, although there were a few felonies not punishable by death, and a few capital crimes which were not regarded as felonies. It became a principle of law that when a crime was declared by statute to be a felony, the punishment of death with forfeiture of land and goods necessarily attached (Blackstone's *Commentaries*, iv. 94). Blackstone accordingly makes felony include all capital crimes below treason. "Every person convicted of any felony for which no punishment is specially provided by the law in force for the time being is liable upon conviction thereof to be sentenced to penal servitude for any period not exceeding seven years, or to be imprisoned with or without hard labor and solitary confinement for any term not exceeding two years, and if a male to be once, twice, or thrice publicly or privately whipped in addition to such imprisonment" (Stephen's *Digest of the Criminal Law*, art. 18). The only practical distinction between felony and misdemeanor is that for the former arrests may be made by private persons acting without judicial authority. The Felony Act, 1870, abolished forfeitures for felony.

FELT is a fabric which results from the matting and intimate adhesion of fibrous materials among themselves, and is not, like ordinary cloth, produced by any spinning and weaving processes. All ordinary textile fibres possess sufficient adhesive tendency to enable them to be handled for spinning; but it is only in certain animal fibres that the peculiarity is so marked as to fit them for felting. The property results chiefly from the serrated or jagged structure of wool and hair, and efficient felting is also promoted by the crimped or wavy form which some fibres naturally assume. These properties are best developed in the short "carding" wool of such sheep as the merino and Saxony breeds, long "combing" wools possessing them in a less degree. Unwashed wool, being coated with the natural grease, does not felt. The hair of other animals, as of the rabbit, hare, coypu, vicugua, musquash, and ox, is employed for making felt of various kinds and for different purposes. Felt has been made and used from the most remote antiquity, and indeed, considering the simplicity of the material and the readiness with which wool felts, it is quite probable that it was known before woven fabrics. From time immemorial it has been employed for clothing and tent covers by the tribes of Central Asia, and to the present day it remains in extensive use among the Circassian, Armenian, and Tartar tribes. It is mentioned by Xenophon and Pliny, and Marco Polo describes its manufacture and applications in Central Asia. Felting results from combined pressure and moisture, and is favored by heat. Ordinary broad-cloth and all "fulled" woollen textures are partly felted, the fulling process having for its object a partial felting of the previously woven material; and the shrinking of woollen garments after washing, with which all are familiar, results from a felting by which the fibres draw closer together, the cloth gaining in thickness and solidity what it loses in superficial extent. The applications of felt are numerous, a certain range of qualities being used for clothing, domestic, and upholstery purposes, while other and generally rougher felts are employed for mechanical appliances. The manufacture of felt hats constitutes its most extensive application, for which see the article HAT. Its manufacture in the form of carpets, drugget, table-covers, and articles of clothing is also important and extensive. The felt for these purposes is made chiefly from wool, which is, after washing, first carded out into exceedingly fine uniform gossamer-like laps. These laps, of the length and breadth of the web to be made, are superimposed on each other in numbers corresponding to the thickness desired in the finished article. The superficial stratum is usually of finer texture than the body, and the mass when ready for felting has the appearance of a huge sheet of cotton wadding. In this state the compound lap is passed between a series of opposite pressing rollers partly immersed in water, some of which are solid and heavy and others hollow and heated internally by steam. In its progress the lap is not only squeezed between the rollers, but an oscillating motion being given to the upper series, it is at the same time submitted to a rubbing action, the result being that it issues a dense compact sheet of felt of uniform thickness. Felt so made is subsequently dyed, printed, and otherwise finished by the ordinary processes applicable to woven tissues. A patent has recently been secured for a carpet made of uniform strips of felt set on edge and tightly laced through the centre. Such a carpet is the same on both sides, and for it great durability, thickness, softness, and elasticity are claimed. Among the leading mechanical applications of felt may be enumerated the covering of steam boilers and cylinders, the lining of damp walls, steam-packing, non-conductors for kilns and refrigerators, filters, polishing wheels, lining between the planking and metal sheathing of ships, printers' blankets, and the covering of roofs. In the coarser qualities of felt cow-hair is the leading ingredient, and waterproof felting for roofs, etc., is impregnated with artificial asphalt and like substances. This manufacture was originally introduced by Croggon and Co. of London under a patent of Dr. Ritchie of Belfast; but the "roofing felt" now made is a misnomer, seeing it is a bituminous compound simply held together by waste flax and other vegetable fibres.

FELTHAM, Owen, a moral writer, whose essays were extremely popular during the 17th century. He is believed to have been the son of Thomas Feltham or Felltham of Mutford in Suffolk, and he was probably born about 1609. He was secretary to the earl of Thomond, under whose roof he wrote, when a youth of eighteen, a volume of one hundred *Resolves, Divine, Moral, and Political*, short and pithy essays, of which two editions saw the light in 1628. Of this book, which the author constantly augmented, eleven editions were printed before 1700 and several since. To later issues of the *Resolves* Feltham appended *Lusoria*, a collection of forty poems. Hardly anything is known of his life, except that Randolph addressed a poem of compliment to him, and became his friend, and that Feltham attacked Ben Jonson in an ode shortly before the aged poet's death, but contributed a flattering elegy to the *Jonsonus Virbius* in 1638. Early in life Feltham visited Flanders, and published his observations in 1652 under the title of *A Brief Character of the Low Countries.* He was a Royalist and a strict high-churchman. It is supposed that he died soon after 1677. Hallam, with excessive severity, has stigmatized Feltham as one of our worst writers. He has not, indeed, the elegance of Bacon, whom he emulated, and he is often obscure and affected after the fashion of his time; but his copious imagery and genuine penetration give his reflections a charm to those who have leisure to peruse them. To the middle classes of the 17th century he seemed a heaven-sent philosopher and guide, and was only less popular than Quarles the emblematist.

An edition published at London in 1806 contains an account of the life and writings of Feltham by James Cumming.

FELTRE, the ancient Feltria, a town of northern Italy, in the province of Belluno, and 16 miles S.W. of the town of that name. It stands on a hill at the foot of the Alps near the Piave, and is partially fortified. It possesses a beautiful town-hall with façades said to be by Palladio, a cathedral, numerous churches, an episcopal gymnasium, a diocesan school, and an orphan asylum. It has some trade in corn, wine, and oil, and manufactures of silk twist, wax, and leather. A money-lending establishment founded there in the 15th century still exists, and is said to be the oldest in Europe. Of the old castle, which was frequently besieged in the Venetian wars of the 14th and 15th centuries, little now remains but a square tower. The population of Feltre in 1871 was 4852, and including the suburbs 6570.

FELTRE, Morto da, a painter of the Venetian school, who worked at the close of the 15th century and beginning of the 16th. His real name appears to have been Pietro Luzzo; he is also known by the name Zarato or Zarotto, apparently from the place of his death: whether he was termed Morto (dead) from his joyless temperament is a disputed point. He may probably have studied painting first in Venice, but under what master is uncertain. At an early age he went to Rome, and investigated the ancient, especially the subterranean remains, and thence to Pozzuoli, where he painted from the decorations of antique crypts or "grotte." The style of fanciful arabesque which he formed for himself from these studies gained the name of "grottesche," whence comes "grotesque;" not, indeed, that Morto was the first painter of arabesque in the Italian Renaissance, for art of this kind had, apart from his influence, been fully developed, both in painting and in sculpture, towards 1480, but he may have powerfully aided its diffusion southwards. His works were received with much favor in Rome. He afterwards went to Florence, and painted some fine grotesques in the Palazzo Pubblico. Returning to Venice towards 1505, he assisted Giorgione in painting the Fondaco dei Tedeschi, and seems to have remained with him till 1511. If we may trust Ridolfi, Morto eloped with the mistress of Giorgione, whose grief at this transaction brought him to the grave; the allegation, however, is hardly reconcilable with other accounts. It may have been after 1511 that Morto returned to his native Feltre, then in a very ruinous condition from the ravages of war in 1509. There he executed various works, including some frescoes, still partly extant, and considered to be almost worthy of the hand of Raphael, in the loggia beside San Stefano. Towards the age of forty-five Morto, unquiet and dissatisfied, abandoned painting and took to soldiering in the service of the Venetian republic. He was made captain of a troop of two hundred men; and, fighting valorously, he died at Zara in Dalmatia, in 1519, or perhaps somewhat later. One of his pictures is in the Berlin Museum, an allegorical subject of Peace and War. Andrea di Cosimo was his pupil and assistant as a decorative painter.

FENCING is the proper use of a small-sword or foil. The small-sword is a light court-dress sword, made to taper gradually from the hilt to the point, and of a size regulated by the judgment of the wearer, if he understand the use of the weapon. The foil with which the art of fencing is practised is a small quadrangular blade, about the length of a small-sword, and mounted in nearly the same manner; but, for the convenience of the exercise, it is made lighter, blunted, and covered with leather at the point, to prevent accidents in practice.

The first weapon in use among mankind, whether for offensive or defensive purposes, appears to have been the sword. The most ancient records make frequent mention of it. The early swords were probably made of wood, like those used by the natives of Mexico when first visited by the Spaniards; but after the discovery of metals, bronze swords were introduced, of which kind many have at different times been found. As soon, however, as the art of tempering steel had been discovered, that metal superseded all other substances in the fabrication of arms; nor is it probable that any change in this respect will take place, or that any further improvement is attainable. The form of sword, however, has varied at different times and in different countries. Those used by the Roman legions were short and strong, with a blade seldom exceeding nineteen inches in length, but two-edged, and calculated both for the cut and the thrust. The British swords, called *spathæ*, were large, long, and heavy; and the Saxon and the Norman partook of the same character. The ancient practice of the weapon was probably carried to its greatest perfection amongst the Romans, whose partiality for gladiatorial exhibitions formed a remarkable feature of their character. The various and complicated methods of combat in which that people took delight are either alluded to or described by most of their writers, particularly by Livy, Juvenal, Seneca, and Suetonius.

The history of the modern small-sword or rapier is involved in some obscurity. The latter term, though now considered as synonymous with the former, probably denotes a long, ordinary, old-fashioned cutting sword. But by a rapier is now always meant a sword for the thrust, in contradistinction to one adapted for cutting. The small-sword or rapier is undoubtedly very ancient, although there is reason to believe that it was not brought into general use until armor for protecting the body began to go out of fashion. Since that time the art of fencing has always been considered as a gentlemanly accomplishment, and in many parts of the Continent it is cultivated with the greatest zeal and assiduity. Some have maintained that the weapon was not used in England before the reign of Elizabeth; and Darcie (*Annals of Elizabeth*) informs us that one Rowland York, who appears to have betrayed Deventer to the Spaniards in the year 1587, was the first who brought into England "that wicked, pernicious fashion to fight in the fields in duels with a rapier called a tucke only for the thrust." Stowe also mentions that long tucks and long rapiers began about the twelfth or thirteenth year of Elizabeth, and that "he was held the greatest gallant that had the deepest ruffe and largest rapier. The offence," he adds, "to the eye of the one, and the hurt unto the life of the subject that came by the other, caused her Majesty to make proclamation against them both, and to place selected grave citizens at every gate to cut the ruffes and break the rapiers' points of all passengers that exceeded a yard in length of their rapiers, and a nayle of a yard in depth of their ruffes." [1]

But at whatever time the small-sword came into use in this country, it is not surprising that, when once introduced, it should have been cultivated as the most equitable instrument of duelling. Before this period meetings for the purpose of single combat were utterly revolting to all notions of fairness. No regard was paid to equality of arms or numbers; advantages, however unfair, were seized whenever an opportunity offered; and the ferocious passions, instead of being curbed, had fuller scope given for their gratification. "The duellist of former times," says Sir Walter Scott, in a note to *The Lady of the Lake*, "did not always stand upon those punctilios respecting equality of arms which are now judged essential to fair combat. It is true that in formal combats in the lists, parties were, by the judges of the field, put as nearly as possible in the same circumstances. But in private duels it was often otherwise." The practice of deciding duels with the sword may be considered as now extinct in England. When the rapier was looked upon as an indispensable part of a gentleman's dress, the facility of immediate rencounter which it offered gave occasion to frequent and dangerous brawls, by which the public tranquillity was disturbed, and the lives of peaceable citizens sometimes sacrificed. Since arms have ceased to be worn, such an objection can no longer be urged against the art of defence; and it may perhaps be questioned whether it ever had much weight.

The practice of the foil is here considered as applied to the most laudable purposes, namely, the enjoyment of salutary recreation and the acquisition of a graceful and unconstrained deportment. The beneficial effects of moderate fencing to persons of weak constitutions, or of studious and sedentary habits, have been attested by medical practitioners of the first eminence. To the public speaker, the practice of the fencing-room has been found to impart an ease and freedom of gesture attainable by no other exercise. For while the use of the foil and the broadsword diffuses ease, elegance, and grace all over the body, and imparts to the look and gesture an appearance of intellectual vigor, it teaches invaluable lessons of patience and self-command, and contributes to discipline the temper. "Perhaps there is no exercise whatever," says Mr. Roland (*Theory and Practice of Fencing*), "more calculated for these purposes (developing and cultivating bodily strength and activity) than fencing. Riding, walking, sparring, wrestling, running, and pitching the bar are all of them certainly highly beneficial; but, beyond all question, there is no single exercise which combines so many advantages as fencing. By it the muscles of every part of the body are brought into play; it expands the chest, and occasions an equal distribution of the blood and other circulating fluids through the whole system. More than one case has fallen under the author's own observation, in which affections of the lungs, and a tendency to consumption, have been entirely removed by occasional practice with the foil."

We now proceed to give such definitions as appear to be requisite for conveying a general idea of the science of fencing, referring the reader for the necessary details to the numerous manuals published on the subject.

Attacks and Parades.—After the first positions have been acquired, the modes of attack come to be considered. Attacks are made in three ways:—first, by a quick thrust proceeding merely from the wrist, the arm at the same time being elevated and advanced, with the point directed towards the adversary's breast; secondly, by what is technically called an extension; and lastly, by longeing and recovering. The parades, in which consists the defensive part of the art, naturally follow the attack. A parade is a defence of the body, made by an opposition of one's blade to that of an adversary, in such a situation as upon his attack to prevent the point of his sword hitting. The parades are eight in number, viz., six simple, called *quarte, tierce, circle, octave, prime, quinte*, and two round or counter parades in quarte and tierce.

Thrusts, etc.—The next division of the subject includes straight thrusts, simple disengagements, and bindings of the blade. A *straight thrust* is used as an attack, when an antagonist, from his position on guard, leaves sufficient opening to enable him to be touched upon that side of the body on which blades are joined. When such an opportunity offers, the wrist must be suddenly raised, so as to bring the "forte" of one's sword to the "foible" of the adversary's; after which longe immediately on the same line to his breast, observing, however, to preserve a correct opposition. In fencing, "opposition" signifies the art of covering the body at the time of delivering a thrust, on that side where the foils happen to cross, in order to prevent an antagonist exchanging hits. The *disengagement* is made either as an attack, or as a return after defending one's self from a thrust, and is executed both under and over the wrist or foils. A disengagement over the arm may be parried with tierce or prime, and, if made low, by the parade of circle; from the position of octave by quarte, or, if the thrust be delivered low, by circle; from the position of quinte by prime as the readiest defence, but quarte and tierce are also correct parades against this thrust. There are three different ways of *binding the blade.* Of these, "flanconnade" is the principal, as it is sometimes a safe attack when any other mode would be attended with considerable danger; it is also made as a "riposte." The attack of flanconnade is commenced when the blades are joined in quarte, and it is parried either by octave or quinte, or by the parade of quarte. The return over the arm, after the parade of circle, is parried by prime or tierce, or by changing quickly to the counter in quarte. The return over the arm, after the parade of prime, is parried by prime or tierce, or, if made at a considerable distance, by the counter in quarte.

Feints.—In fencing there are a great variety of feints, which it is not easy to describe intelligibly without figures. A feint is an intentional movement made to deceive an adversary. All thrusts, therefore, may, strictly speaking, come under the definition of feints, as the fencer's object, in all his attacks, is to deceive his antagonist. For the sake of convenience, however, straight thrusts and simple disengagements have been arranged under a separate head. In executing the feint called *one two*, inside of the arm, supposing the adversary's body to be covered in quarte, the parade of tierce is deceived; commencing from the outside, that of quarte is deceived; from the position of the circle the octave, and from that of the octave the circle is deceived. This feint, if made inside the arm, is parried by the parade of quarte, or by the counter in tierce, made upon an opponent's second disengagement; upon the outside of the arm, by tierce, prime, or the counter in quarte; and from the position of the octave, by octave or quinte. The feint *one two* is likewise made as a return after the parade of quarte or tierce, or sometimes after that of circle or octave. The *cut and disengage* is a species of *one two*, in making which from the position of quarte an adversary's parade of tierce is deceived, and from the position of tierce his parade of quarte. *Cut and disengage*, if made inside of the arm, is parried by quarte, or the counter in tierce; if outside, by tierce or counter in quarte. *Feint seconde* is another feint very nearly resembling *one two*, and is generally made as a return after the parades of tierce, prime, or quinte. In this feint the octave or quinte is deceived; and it is parried by tierce, prime, or quarte, the two former being the readiest where quinte is the parade deceived, but if the feint has been answered with octave, the thrust must then be parried with quarte. The feint *one two three* is made on either side of the blade, upon precisely the same principles as *one two*,—the only difference between them consisting in making one disengagement more in the latter than in the former movement. The *cut and one two* is a species of *one two three.* These feints, if made over the arm, are parried with the simple parade of tierce; if on the inside, with simple quarte. The other feints are—*doubling,* which, *mutatis mutandis,* is executed upon precisely the same principles; *one two and deceive the circle,* executed from the inside position of quarte; *one two and deceive the counter,* which may be made from either side of the blade, but most frequently commences from the position of tierce; *feint flanconnade,* which can be commenced only from the engagement of quarte; *feint seconde and deceive quarte,* which is always commenced from the outside engagement, whether made as an attack or a return; *feint seconde and deceive tierce,* which differs from the preceding only in the last disengagement; *one two and deceive quarte from the position of the circle,* when the first disengagement is made over the adversary's wrist towards the body under the arm, and the second over the wrist towards the inside of the body; and *doubling on both sides of the arm,* which is too complicated a feint to be frequently used in actual fencing, because it is difficult to follow the adversary's sword with certainty through many different parades, and there is much danger of "time thrusts" upon feints which consist of so many disengagements.

---

[1] In *The Two Angry Women of Abingdon*, a comedy printed in 1599, we find the following pathetic complaint: "Sword and buckler fights begin to grow out of use. I am sorry for it; I shall never see good manhood again. If it be once gone, this poking fight of rapier and dagger will come up; then a tall man, and a good sword-and-buckler man, will be spitted like a cat or a rabbit."

Time thrusts are so called because the success of these movements depends entirely upon their being executed at the exact moment of time employed by the adversary in planning or in executing his attack; and, when made correctly, they are by far the most scientific movements in fencing. There are two sort of time thrusts, in the execution of one of which it is necessary that the blades should cross each other, but for the completion of the other it is not absolutely necessary that the blades should even meet. Those time thrusts in the execution of which the blades cross are more scientific, and expose the fencer less to exchanged hits. There are two time thrusts *in opposition*—one the *time over the arm,* and the other the *time in octave.* The former is applicable to all thrusts, however simple or complex the feint may be, provided the longe is made upon the outside; whereas all longes directed to the inside of the body, or under the arm, are exposed to the time in octave; and thus almost every thrust made in fencing affords an opportunity for one or other of these two movements. Those time thrusts in which the opposition is not essential are made upon incorrect movements of the adversary, when he exposes himself by the wideness of his attacks, or by quitting the blade in a dangerous position, or by making too many disengagements in his feints, or by giving a variety of openings which the judgment of the fencer must determine how he is to take advantage of. This thrust is practised almost entirely upon irregular attacks, and requires great caution to be observed. It has been already stated that time thrusts in opposition, when correctly made upon good attacks, are perhaps the finest movements in fencing; but young fencers should nevertheless attempt them very seldom, from the danger of misjudging the attack, and thus exposing themselves to the certainty of being hit. And the time out of opposition is attended with still greater hazard, as its success depends rather upon the wideness and irregularity of an adversary's movements than on the security of one's own situation afforded by the opposition in the former species of time thrust.

When fencing was comparatively little known, it was thought necessary that there should be some intermediate practice for the pupil between the lesson of the master and his making the assault; for which purpose, it appears, he was taught to longe, at a proper distance, at the wall. This was called by the French *tirer au mur,* and was considered as useful for planting the learner well upon his legs, accustoming him to measure distance correctly, and causing his motions, in making his extension and longe, to follow one another in the proper succession. But as the art became better understood, observation induced masters to place pupils together for their mutual advantage, the one to attack by simple disengagements, the other to parry by quarte and tierce alternately; and this practice, from its origin, was long called *tirer au mur.* It is now, however, generally known as *quarte and tierce,* and, in its improved state, is not merely intended as an exercise for the scholar, but also as a graceful display of the principal motions of fencing; for which reason it should be invariably practised before commencing the assault, and in fencing before company it is never dispensed with. Quarte and tierce appears very simple in its execution, yet it is exceedingly useful to fencers in all stages of their progress, and difficult to acquire with such correctness that all its movements shall take place in their proper succession, and be made with the grace and precision characteristic of a good fencer. The *counters* is also a practice of importance to young fencers.

In the language of the fencing-room, making the *assault* and *playing loose* are synonymous, signifying the practice of attack and defence, or, in other words, a just application of the lessons received, which, in fact, ought to be done as correctly as if with sword in hand. In the assault, the mere movements should be almost mechanical; for the mind being wholly employed in discovering and counteracting the designs of the adversary, as well as in concealing its own, the hand should, on the proper opportunity being given, instantly execute that which the mind conceives without any consideration of the manner in which the particular motion is to be made.

The rules to be observed are few and distinct. The first thing which the attention of a young fencer should naturally be directed to is the most secure manner in which he can come into the position of the guard, when opposed to an adversary ready to take every advantage of his inexperience. Whilst advancing into distance, it is also an object of importance to have one side of the body secured by the position, particularly that side to which the antagonist's blade is opposed; so that, if he commence an attack during this movement, he must quit the blade in order to direct his thrust or feint at any opening afforded him by the position of his opponent; and the opportunities of attack being few, his designs will thus be the more easily discovered. In short, the commanding an opponent's blade almost obliges him to effect some change in the relative situations of the contending parties, before he advances into distance; and as the necessity of such previous movement must be foreseen, any attempt of this kind is favorable for making an attack on him. And, generally, whilst standing in the position of the guard, it is an advantage to have one side of the body covered, and to command the foible of the adversary's blade. Straight thrusts and simple disengagements, executed with quickness and vigor, should frequently be attempted, even though they do not succeed in hitting; and this should be particularly attended to in fencing with a stranger. Quick simple thrusts are almost the only certain way of ascertaining his favorite parades, and consequently of knowing by what feints to attack him with a probability of success. The suddenness and rapidity of the attack will inevitably extort from him the secret of his favorite defence.

Many masters of the old school, and some, too, of the present day, have treated *disarming* as of importance in the art; but from its inutility, not to mention danger, in the field, it is now considered incompatible with good fencing, and indeed no better than a trick. The only advantage of disarming is that of annoying the person disarmed; for, sword in hand, it is rendered nugatory by the use of a sword-knot, with which, it may be presumed, every person at all acquainted with the weapon will take especial care to fasten it to his wrist in a seriou affair. As the manœuvre may therefore be defeated by the most ordinary precaution, attempting it can serve no other purpose than to cause heavy and unpleasant play; whilst the strength it requires for its execution is a drawback, and affords an adversary favorable moments of attack during the time an attempt is being made to bind his blade.

As far back as 1692 a very curious book on the subject of fencing was published by Sir William Hope; it is now very scarce. In 1780 a Lieutenant M'Arthur published a work on fencing, which he dedicated to the duke of Argyll. Several modern works of merit have appeared on this subject; one of the most valuable and complete is Roland's *Treatise on the Theory and Practice of the Art of Fencing.*

FÉNELON, BERTRAND DE SALIGNAC (?—1589), Marquis de La Mothe, a French diplomatist who was ambassador to England during the reign of Elizabeth. At the request of Charles IX. he endeavored to excuse to Elizabeth the massacre of St. Bartholomew as a necessity caused by a plot which had been laid against the life of the king of France. For some time after the death of Charles IX. Fénelon was continued in his office, but he was recalled in 1575 when Catherine de' Medici wished to bring about a marriage between Elizabeth and the duke of Alençon, and thought that another ambassador would have a better chance of success in the negotiation. In 1582 Fénelon again arrived in England, charged with a private commission from the king of France, chiefly with the view of obtaining the liberation of Mary queen of Scots on the promise of a French alliance; but Elizabeth saw reason to doubt the king's sincerity, and Fénelon had to leave England without gaining his purpose. He died in 1589.

Fénelon is the author of a number of writings, among which those of general importance are *Mémoires touchant l'Angleterre et la Suisse, ou Sommaire de la négociation faite en Angleterre, l'an 1575* (containing a number of the letters of Charles and his mother, relating to Queen Elizabeth, Queen Mary, and the Bartholomew massacre), published in the *Mémoires* of Castelnau, Paris, 1659; *Négociations de La Mothe Fénelon et de Michel, sieur de Mauvissière, en Angleterre;* and *Dépêches de M. de La Mothe Fénelon, Instructions au sieur de La Mauvissière*, both contained in the edition of Castelnau's *Mémoires*, published at Brussels in 1731. The correspondence of Fénelon was published at Paris in 1838–41, in 7 vols. 8vo.

FÉNELON, François de Salignac de Lamothe (1651–1715), archbishop of Cambray, and one of the most celebrated names in the intellectual and ecclesiastical history of France in the 17th century, was born at the Château de Fénelon in Périgord, August 6, 1651. The family of Salignac or Salagnac, to which he belonged, had been ennobled from the middle of the 15th century, and produced already many distinguished names. The father of the future archbishop was Count Pons de Salignac, of whose second marriage, contracted in mature years, François was the only child. From his birth he was of a delicate and sensitive temperament; and, greatly beloved by his old father, he was educated at home till he was twelve years of age. He received, according to one of his biographers, "a simple Christian education devoid of anything remarkable." But he must have been lucky in his tutor or of rare aptitude for learning, for he seems then to have laid the foundation of his admirable scholarship and love of letters. After a short time at the college of Cahors, he went to Paris to complete his studies under the Jesuits at the Collége du Plessis. There his great gifts soon drew to him distinction, and, like his rival Bossuet, he ventured to preach to an admiring audience at the age of fifteen. His father seems to have died before this time, and his uncle, the Marquis de Fénelon, who had assumed the care of his education, withdrew his charge from what might have proved injurious seductions, and placed him in the seminary of St. Sulpice under the saintly Trouson. His uncle was himself a remarkable man. Distinguished as a soldier and a statesman, he became no less distinguished for his piety and moral heroism. In conjunction with M. Olier, the founder of St. Sulpice, he inaugurated and became the first president of an association for the suppression of duelling. The association was composed only of men whose valor was unimpeachable, and whose oath binding them to refuse any challenge or take part in any duel could not therefore be mistaken. The Marquis de Fénelon and his daughter, who became Madame de Montmorenci Laval, wife of the Marquis de Montmorenci Laval, both exercised a decisive and happy influence over the young Fénelon. Many of his early letters are addressed to his cousin, whom he looked upon as a sister—the only one he had ever known. But the head of St. Sulpice, M. Trouson, shared with these relatives the task of his higher education, and no one, both now and afterwards, enjoyed so much of his confidence. "Great as is my freedom and openheartedness with you," the young student writes to his uncle after being placed at the seminary, "I must confess without any fear of making you jealous that I am still more unreserved with M. Trouson; if you could hear our conversation and the ease with which I lay bare my heart to him, and with which he teaches me to know God, you would not know your pupil, and you would see that God has very marvellously helped on the work which you began."

Fénelon's first aspirations were towards a missionary life. The congregation at St. Sulpice had established a missionary society at Canada which many of its pupils had joined, and he wished to follow their steps; and when this project failed he still more earnestly desired to undertake a mission to Greece. In one of his letters, dated October 9, 1675, he draws a glowing sketch of his desire to visit "the glorious scenes," redolent of the spirit of antiquity, which he had so often pictured in imagination, and "to seek out the Areopagus whence St. Paul proclaimed the unknown God to heathen sages." But his delicate health, and the dissuasion of another uncle, the bishop of Sarlat, interfered with his missionary longings. He was induced to remain at home and accept the office of superior of the community of Nouvelles Catholiques, a community founded for the protection and instruction of women converted from Protestantism. He spent ten years (1675–85) of quiet and successful labor in connection with this institution, became intimately associated with a select circle, at the head of which was the Duc de Beauvilliers, began his career as an author, and otherwise laid the foundation of his remarkable influence. It was at the request of the Duchesse de Beauvilliers that he is said to have written his first work, *De l'Education des Filles*, which long maintained its reputation among the higher families of France, and may still be consulted with advantage. It contains many admirable precepts. To this same period belong a *Refutation of Malebranche's Treatise of Nature and Grace*, in which he was assisted with marginal notes by Bossuet, and a treatise on the *Ministry of Pastors*, in which he set forth the blessing of a divine order appointed in uninterrupted succession from the apostles to guard men from error, seeing that all experience proves how unable ordinary men are "to decide for themselves as to the details of dogmas." This treatise had a polemical aim against the Protestants, but was at the same time written with great moderation and fairness.

In 1685 Louis XIV. carried out his infamous policy of expelling the Protestants from France by the revocation of the edict of Nantes. Great disturbance arose in consequence in the districts of Poitou and Saintonge. It was necessary, by firm yet gentle means, to do something to allay the violent irritation which had been caused. On the recommendation of Bossuet, Fénelon was chosen as the head of a mission for this purpose. He made two conditions,—that all troops should be withdrawn from the provinces, and that he should be allowed to choose his fellow workers. The result was that his mission was attended with considerable success, although he himself complains more than a year afterwards, "Our converts get on very slowly;—it is no easy matter to change the opinions of a whole people." On his return to Paris he had several interviews with the king to report the result of his labors, and afterwards resumed in comparative privacy his old duties among the Nouvelles Catholiques. M. de Harlay, the well-known brilliant but profligate archbishop of Paris, who had first advanced him to this position, withdrew his favor from him when he saw he could make no use of him. "It seems, M. l'Abbé, that you wish to be forgotten, and you shall be," was his bitter speech on one occasion; and he so far succeeded as to prevent Fénelon's appointment to the see of Poiters which had been contemplated by the king.

Suddenly he was called to the responsible position of preceptor of the dauphin's son, the young duke of Burgundy. This was the work especially of his friend the Duc de Beauvilliers, who in 1689 was appointed governor of the royal grandson. But other friends warmly rejoiced in Fénelon's advancement, and amongst these Bossuet wrote to Madame de Montmorenci Laval congratulating her. "We shall not lose the Abbé Fénelon," he says; "you will be able to enjoy him, and, provincial as I am, I shall escape from time to time to embrace him." It is interesting to notice this renewed trace of hearty friendship between these two illustrious men, considering the unhappy relations which afterwards arose between them.

No man probably was ever better fitted than Fénelon for the difficult position which he now assumed, and to which he mainly devoted himself during the next six years (1689–95). He was a born teacher in the highest sense,—gifted with the most charming qualities of patience, sweetness of temper, tact, and address, yet inflexible in principle, and severe and unbending in his methods of training. He had the manners of a *grand seigneur*, with all the intellectual refinements of an accomplished churchman. Saint Simon in his *Mémoires* (t. xxii. p. 135) has left a portrait of him about this time which has been often quoted, and from which we extract only a few sentences. "He was a tall thin man, well made, pale, with a large nose, eyes whence fire and talent streamed like a torrent, and a physiognomy the like of which I have never seen in any other man, and which once seen one could never forget. It combined everything, and the greatest contradictions produced no want of harmony. It united seriousness and gayety, gravity and courtesy—the prevailing characteristic, as in everything about him, being refinement, intellect, gracefulness, modesty, and above all *noblesse.* It was difficult to take one's eyes off him. All his portraits are speaking, and yet none of them have caught the exquisite harmony which struck one in the original, or the exceeding delicacy of every feature. His manner altogether corresponded to his appearance; his perfect ease was infectious to others, and his conversation was stamped with the grace and good taste which are only acquired by habitual intercourse with the best society and the great world." He had need of all his brilliant and solid qualities in the task which he had undertaken. The young duke of Burgundy, as the same writer remarks, "was born with a *naturel* which made one tremble. He was so passionate that he would break the clocks which summoned him to some unwelcome duty, and fly into the wildest rage with the rain which hindered some pleasure." He was withal warm-hearted and clever,—in fact, "dangerously quick in penetrating both things and people." Fénelon had full scope for the exercise of his marvellous educational art, and the result was a success far beyond what is usual in such cases. The impetuous but affectionate and bright child grew under his charge into an earnest, well-disciplined, and promising, if somewhat over-scrupulous and timid youth, whose life if spared might have brought blessing to France. Fénelon carefully planned all the details of his education, and has embodied in his well-known *Télémaque* and other writings the principles on which he based it. It was his aim to train the young prince not merely in habits of self-control, to direct his scholarly acquirements and religious convictions, but, moreover, to awaken in him true and large political instincts fitted to qualify him for his high position. Fénelon himself, while an aristocrat both by birth and feeling, and strongly favorable to the maintenance of these class distinctions, which were especially marked in France in the 17th century, was at the same time essentially liberal in his recognition of the radical equality of all men, and the moral regards which should regulate the relation of classes to one another. His ideal was that of a limited monarchy, surrounded by national institutions, each having its due place and function in the body politic, and representing in due degree public opinion. A written constitution, one sovereign law for all, universal education provided by the State, the reciprocal independence of the temporal and spiritual powers, detestation of war, free industry in agriculture and trade, a people growing in intelligence and self-dependence round the throne and under the guidance of the church,—such were the broad principles which he sought to instil into his pupil, and so to make him, in his own language, "a philosophic king," "a new Saint Louis." The task was a noble one, and it was pursued with all the fascination, patience, and quiet earnestness which distinguished him.

But a train of circumstances was preparing, destined to impair and finally to overthrow his influence at court, and to banish him from all intercourse with his royal pupil. We can only very briefly indicate the causes which led to this result. A system of religious mysticism known as Quietism had been set afloat towards the end of the 17th century by a Spanish priest of the name of Molinos. The system was espoused in France amongst others especially by Madame Guyon, a remarkable woman devoted to the cause of religion, but of an erratic and restless temperament. Her writings on the subject attracted wide attention, and speedily called forth ecclesiastical condemnation. The archbishop of Paris took up a position of violent hostility towards her; the severe and methodical character of the king was greatly offended by her excesses; and Bossuet was by and by drawn into the circle of her vehement opponents. Strangely it was by Fénelon's advice that the subject was first brought under Bossuet's notice. Attracted by Madame Guyon's genuine enthusiasm, and no doubt finding something in her view of disinterested mysticism which appealed to his own religious temperament, he recommended her to place her writings in the hands of the bishop of Meaux, and to abide by his decision. Many conferences were held on the subject, in which Fénelon at first took no part, and during the progress of which he held friendly communication with his old friend, and in fact supplied Bossuet, who professed his ignorance of the mystical writers, with extracts from the fathers and others bearing on the controversy. The relation of the two friends continued apparently cordial; the atmosphere of the court had not yet changed towards him, for it was at this very time, in the beginning of 1695, that the king nominated Fénelon for the archbishopric of Cambray; but gradually out of this miserable business there sprung up a host of embittered feelings. After his appointment as archbishop, Fénelon had joined in the conferences at Issy which finally condemned Madame Guyon's doctrines. He scrupled, however, to subscribe her condemnation; he scrupled also to express approval of a publication of Bossuet attacking these doctrines; and in vindication of his own position and principles he published his *Maximes des Saints sur la vie intérieure.* The result was to kindle into greater fury the storm of controversy, to provoke the jealous and violent animosity of Bossuet, and to fan the suspicions with which the king had always more or less regarded him into such a vehement outbreak as to lead to his permanent banishment from court, and his condemnation at Rome (1699). He submitted himself to the pontifical decision. But this did not save him either from the continued anger of Bossuet or from the displeasure of the monarch, which were further excited by the publication, through the treachery of a secretary, of his *Télémaque,* under the allegorical disguise of which Louis and his courtiers recognized a satire against the absolutist principles of the French Government.

Fénelon himself disclaimed any such intention. "He had," he said, "introduced all the virtues necessary for a good government, and the faults to which sovereign power is liable, but none were drawn with the slightest approach to any personality or portraiture. The more the book is examined, the more it will be seen that it only expressed principles fully, without attempting to draw any finished character. My only object was to amuse the duke of Burgundy with a tale of adventure, and to instruct him at the same time, without ever thinking of giving the work to the public" (*Corresp.,* t. iii. p. 247).

The remainder of Fénelon's life was spent in his diocese in ceaseless works of Christian piety and charity. Cambray abounded in Protestants and Jansenists, whom he greatly won by his toleration and evangelical simplicity. It was, moreover, a great thoroughfare for the armies of the time, to the necessities of which, and especially of the sick and wounded, he personally ministered. His own palace was sometimes crowded with invalided officers, who remained his guests for months. He became in consequence endeared to the army and the people. Mingling familiarly with the poorest peasants under his spiritual charge, dispensing with liberality, yet without ostentation, the duties of Christian hospitality, carrying on an extensive correspondence with the clergy and some of his old friends at court, he became more honored in his retirement even than he had been in Paris. "In everything," says Saint Simon, "he was a true bishop, in everything a *grand seigneur,* in everything, too, the author of *Télémaque.*" A curious picture is preserved of these later years of Fénelon by a Scotchman of the name of Andrew Ramsay, who had wandered over Holland and Germany in search of something more satisfying than the sectarianism of his native country, or the deism which seemed to him for a time the only alternative. Won by the spiritual beauty of Fénelon's character, and the elevation of his teaching, he embraced the Catholic faith, spent much of his time at Cambray, and wrote the first life ever published of his teacher and friend. The last years of the good archbishop's life were saddened by the loss of most of his friends. "Our best friends," he said, on hearing of the death of the Duc de Beauvilliers in 1714, "are the source of our greatest sorrow and bitterness." And again he wrote to a remaining friend, "I only live in friendship now, and friendship will be the cause of my death." He died on the 17th January, 1715.

Fénelon is chiefly remembered for the beauty of his character, his tender and mystic devotion, and the charm of his style as a writer. He is not great as a thinker, nor can the substance of his writings be said to have a permanent value. But there is the same subtle delicacy, sensibility, and tenderness and purity of expression in his style as in his character. An exquisite highly-toned and noble genius pervades the one and the other. As a man he is one of the greatest figures in a great time. As a writer he has been placed in prose on the same level with Racine in poetry. In both there is the same full harmony and clearness, the same combination of natural grace with perfect art.

In addition to the works of Fénelon already noticed, the following deserve to be mentioned:—The *Dialogues des Morts, composés pour l'Éducation d'un Prince*, 1712; *Dialogues sur l'Éloquence*, etc., 1718; *Lettres sur divers sujets concernant la religion et la métaphysique*, 1718; *Traité de l'Existence de Dieu*, etc., 1713. There are many collected editions of his works. That of Leclerc (Paris, 1827–30), 38 small vols., is the latest. An excellent life of Fénelon has recently appeared in English (1877) by the same author as the *Life of Bossuet* mentioned under that article. (J. T.)

FENIANS. Ireland appears to have been the theatre of a great ethnic struggle in the first century of the Christian era, in which certain tribes, known to the Romans as Scots, reduced the other inhabitants to subjection. The servile clans are called in Irish story *Aithech Tuatha*, rent-paying tribes, though one of them settled near the river Liffey is specially mentioned as the *Tuath Aithechta*, a name believed to have been the origin of the Latinized tribe-name *Atticotti*. According to Irish tradition Scotic power appears to have been fully established in the reign of a king called *Tuathal*, the Legitimate, who was slain about 160 A.D. Between this prehistoric king's reign and the mission of St. Patrick, an interval of about 300 years, was the period of the invasions of Roman Britain by the Picts and Scots, which, though not strictly within the historic period of Irish history, touches upon it so closely that many traditions of the time have come down to us intermingled with a rich and increasing growth of legend embodied in verse and prose tales, known to the Irish speaking peasantry as *Sgeulta fiannuigheachta*, stories of the *Fians* or Fennians. The word *Fianna* is glossed in an Irish MS, by *feinneda*, champions, that is, of the king of *Eire*. Instead of *Fian, Fianna*, we have also the words in the oblique case *feinn, feinne*, from whence has come the English form Fenian. The stories are sometimes also called Ossianic, from a corrupt form of the name of a Fenian poet and warrior named *Oísin*, the Ossian of Macpherson; but though properly applicable to poems, the term cannot be applied to prose tales.

According to popular tradition the *Fians*, or Fenians, were mercenary tribes acting as a permanent military force for the support of the *Ard Rig*, or king of *Eire*. They are supposed to have been instituted by a prehistoric king, *Fiachadh*, the father of the above-named *Tuathal*, or his brother according to another account, and to have enjoyed great power for about 150 years, until, some of them having taken part with the king of Leinster against the king of *Eire*, they nearly annihilated each other in the battle of Gabhra, which is perhaps only another way of saying that the king, jealous of their power, broke up the organization. The term *Fian* continued, however, to be sometimes applied by the poets to the *Amos*, or mercenary troops, which the provincial kings, as well as the king of *Eire*, kept about them. In later times poets even used it in the general sense of soldiers, hence the use of such expressions as "*Fians* of *Alba*," "*Fians* of *Breatan*," etc. As the Irish princes had an opportunity of learning something of the Roman military system in Britain,—Tacitus (*Agr.*, xxiv.) mentions that one was in the camp of Agricola,—there is nothing improbable in the Scotic or Milesian kings imitating it so far as to assign constant military duty to certain clans. One of the glosses on the word *Fianna* explains it as *fineadha*, because it was in *Fines*, septs, they were formed. The Leinster and Meath Fenians, consisting of the *Clanna Baiscné*, from a stemfather *Bascné*, are said to have been Damnonians of the subjugated tribes of the *Gaileoin* settled in Meath and East Leinster, one of which was the *Tuath Aithechta* above mentioned. The *Gaileoins* figure in the *Táin bo Cuailnge*, a celebrated tale of the older or Heroic cycle of Irish romance, as the Leinster contingent of *Ailill*, the husband of Queen *Medb*, the heroine of the tale. The Connaught Fenians, the *Clanna Morna*, so called from a stemfather *Morn*, were also a servile tribe, the *Tuath Domnann*, settled in Erris in the west of Mayo. *Ferdiad* son of *Daman*, whose combat with *Cúchulaind* forms the finest episode of the *Táin bo Cuailnge*, was of this tribe. The *Clanna Degaid*, or Munster Fenians, were also probably one of the subjugated tribes. *Curoi* son of *Dare*, a celebrated hero of the older or Heroic period, seems to have been of this race. It is worthy of note that Ulster, whose warriors of the *Craebh Ruaid* or Red Branch are the most prominent figures in the Heroic period, had no Fenians. The genealogists of later times, desirous of making every warrior, poet, and saint a Milesian, provided elaborate Milesian pedigrees for the *Clanna Baiscné*, to which belonged the chief hero of the Fenian period, *Deime*, surnamed *Finn*, or *Find*, son of *Cumall* son of *Trenmor; Find's* sons *Oísin* and *Fergus Finnbheoil*, *Oscar* son of *Oísin*, *Caoilté* son of *Ronan*, and many others. His great rival *Aedh* called *Goll* (the one-eyed) *Mac Morna*, *Conan Mac Morna* grandson of *Goll*, and the other warriors of the *Clanna Morna* or Connaught Fenians, continued to be regarded as Firbolgs.

The Irish MSS. contain no account of the organization or distribution of the Fenians, except what can be gathered from incidental references; but Dr. Keating, who appears to have had access to many MSS. since lost, and who may be trusted to tell only what he found in them, gives in his *History of Ireland* a curious legendary account to which the reader is referred. It was this account which suggested calling the members of an organization that was formed a few years ago among the Irish in the United States of America for promoting and assisting revolutionary movements in Ireland, and which attained much notoriety, Fenians (see IRELAND). The founder of the modern Fenians, John O'Mahony, was also the author of a translation of Keating's *History*, which he published in New York in the year 1857.

Conn of the Hundred Battles, *Art* the son of *Conn*, *Cormac* son of *Art*, and *Cairbre* son of *Cormac*, the chief kings of the Fenian period, *Find* son of *Cumall*, and his son *Oísin*, and some others of the chief heroes, are doubtless real personages. But even in the oldest manuscripts they are so mixed up with mythological beings that it is impossible to sift fact from fiction. Thus in the *Leabhar na h-Uidhri*, the oldest existing MS. written wholly in Irish, some time before the year 1106, there is a story concerning a certain king *Mongan* the subject of many legends, who is supposed to have flourished at the end of the sixth and beginning of the seventh century, which makes him out to be no other than the celebrated *Find* son of *Cumall* himself. The Fenian stories are merely Celtic myths in a new dress, clothing a few misty forms of real life, about whom we know almost nothing. As has been stated in the article CELTIC LITERATURE, the personages of the Heroic period, *Cúchulaind*, *Fergus* son of *Rog*, *Conal Cernach*, *Laegaire Buadach*, *Catbad* the Druid, Queen *Medb*, *Ferdiad* son of *Daman*, etc., are never associated in any genuine tale with those of the Fennian or Fenian period, such as *Find* son of *Cumall*, *Oísin*, *Oscar*, *Diarmait*, *Caoilté Mac Ronain*, *Goll Mac Morna*, etc.

The recitation of Fennian stories in the halls of kings and chieftains, and in popular assemblies by the *Fili*, was usual in the 12th century, as we learn from a poem on the triennial *Aonech*, or fair of Carman, now Wexford, in the Book of Leinster, a manuscript of that time. This manuscript also contains poems attributed to *Find* himself, and to his son *Oísin*, and most of the poems and prose tales coming under the head Fennian, or Fenian, and now or recently current among the Irish-speaking peasantry, are also to be found in MSS. at least 300 years old.

As might be expected from the common origin of the Irish and Gaelic population of Scotland, and the close intellectual association between them for centuries, owing to the literary language of both being the same, and to the additional circumstance that the Irish poets, harpers, and leeches looked upon Celtic Scotland quite as much within their domain as any part of Ireland, Fennian poems and tales were as well known in the former as in the latter. The written stories when old are in the literary language, that is Irish, and do not differ from those found in similar MSS. in Ireland. The current stories are of course in the Gaelic dialect of Scotland, which has gradually supplanted Irish as the literary language since the literary separation of Ireland and Scotland, caused by the Reformation and the decay of the Irish language in Ireland itself. It was such stories, written in the literary language or Irish, and others still current among the Gaelic-speaking population of the Highlands, that suggested to James Macpherson the subjects of his poems of Ossian, and supplied him with a considerable part of the materials. In using these materials he mingled the events and the actors of the two perfectly distinct periods of story, that of *Cúchulaind*, or the Heroic period, and that of *Find*, or the Fennian period. Macpherson was not, however, the first who was guilty of this anachronism; in the Book of the Dean of Lismore, transcribed in the first half of the 16th century, there is a sort of mosaic poem made up apparently of fragments of totally different stories belonging to both periods, and having lines interpolated to link the fragments.[1] It is a rude example of what Macpherson did so well 200 years after. The first part appears to be a fragment of a version of the *Seirgligi Conculaind*, or Sick Bed of *Cúchulaind*, into which are introduced references to the *Fians;* then follows a fragment concerning the death of *Conlaech*, son of *Cúchulaind;* this is followed by a fragment about the battle of *Cnuca*, in which *Cumall*, son of *Trenmor* and father of *Find*, was slain by *Goll* son of *Morn*.

(W. K. S.)

FENNEL (*Fœniculum*), a genus of umbelliferous plants, having umbels compound and without involucres; petals yellow, entire, roundish, and incurved at the tip; and fruit a laterally compressed cremocarp, with achene 5-ridged, a large, single vitta under each furrow, and albumen plano-convex. (See BOTANY, vol. iv. p. 136, fig. 292; and p. 137, fig. 299.) Common Fennel, *F. vulgare*, Gärtn. (*Anethum Fœniculum*, L.), to which the other forms of fennel are generally referred, is a perennial from 2 to 3 or, when cultivated, 4 feet in height, having leaves three or four times pinnate, with numerous linear or awl-shaped segments, and umbels glaucous, and of about 15 or 20 rays. The plant appears to be of South European origin, but is now met with in various parts of Britain and the rest of temperate Europe, and in the west of Asia. The fruits have an aromatic taste and odor, and are used for the preparation of oil of fennel and fennel water, valued for their stimulant and carminative properties. The fruits and edible shoots of fennel were eaten by the ancient Romans. The fennel seeds of commerce are of several sorts. Sweet or Roman Fennel seeds are the produce of a tall perennial plant, with umbels of 25–30 rays, which is cultivated near Nismes in the south of France; they are elliptical and arched in form, about $\frac{2}{5}$ inch long and a quarter as broad, and are smooth externally, and of a color approaching a pale green. Shorter and straighter fruits are obtained from the annual variety of *F. vulgare* known as *F. Panmorium* (*Panmuhuri*) or Indian Fennel, and are employed in India in curries and for medicinal purposes. Other kinds are the German or Saxon fruits, brownish-green in color, and between $\frac{1}{5}$ and $\frac{1}{4}$ inch in length, and the broader but smaller fruits of the Wild or Bitter Fennel of the south of France. A variety of fennel, *F. dulce*, having the stem compressed at the base, and the umbel 6–8 rayed, is grown in kitchen-gardens for the sake of its leaves. Giant Fennel is the name applied to the plant *Ferula communis*, common in Sicily, where the pith of the stem is used as tinder. Hog's or Sow Fennel is the species *Peucedanum officinale*.

FENTON, ELIJAH (1683–1730), an English poet, was born at Shelton, near Newcastle-under-Lyme, Staffordshire, 20th May, 1683. He entered Jesus College, Cambridge, with the view of studying for the church, but afterwards declined to take orders, and on leaving the university he accompanied the earl of Orrery to Flanders in the capacity of private secretary. On the return of the earl to England in 1705, Fenton became assistant in a school at Headley in Surrey, and was soon afterwards appointed master of the free grammar-school at Sevenoaks in Kent. In 1710 he was induced by the promise of a political appointment from Lord Bolingbroke to resign his mastership, but a change in the Government led to the disappointment of his hopes. He was, however, not long afterwards appointed tutor to Lord Broghill, only son of the earl of Orrery; and when this engagement expired, he was, on the recommendation of Pope, employed to give private literary instructions to Mr. Craggs, secretary of state. His next engagement was with Pope himself, whom he assisted in translating the *Odyssey*. The first, fourth, nineteenth, and twentieth books are ascribed to Fenton. In 1717 he published a volume of *Miscellaneous Poems*, and in 1723 his tragedy of *Marianne* was brought out, and was performed with such success that the author's profits are said to have amounted to nearly a thousand pounds. The poetical merit of this tragedy is considerable; but the diction is too figurative and ornate for a dramatic composition, and accordingly it has not retained its place on the stage. In 1727 Fenton superintended a new edition of Milton's *Poems*, to which he prefixed a life, and in 1729 he published a splendid edition of Waller, with notes. During the latter part of his life he was employed by Lady Trumbull, first as tutor to her son, and afterwards as auditor of her accounts. He died at East Hampstead, Berkshire, on the 13th of July, 1730, and was interred in the parish church, where his tomb has inscribed on it an epitaph written by Pope.

See Johnson's *Lives of the Poets;* Boyle's edition of Pope; and *The Gentleman's Magazine*, lxi., lxiv.

FENTON, SIR GEOFFREY, a writer and statesman during the reigns of Elizabeth and James I., the brother of Edward Fenton the navigator, who accompanied Sir Martin Frobisher in his expeditions, and was afterwards sent out independently to endeavor to discover a north-west passage. In the capacity of queen's counsellor Sir Geoffrey served for twenty-seven years in Ireland, where his conduct appears to have given great satisfaction to his royal mistress, notwithstanding that he took every opportunity of impressing on her mind the strong conviction he entertained that the safety and glory of her government in that island depended on her subjects enjoying the protection of equal laws. He died at Dublin October 19, 1606.

Fenton is best known for his translation of the *History of the Wars of Italy* by Guicciardini, which he dedicated to Elizabeth. Of his other translations the principal are *Certain Tragical Discourses written out of French and Latin*, 1567, and *Golden Epistles, containing a variety of discourses, both Moral, Philosophical, and Divine, gathered as well out of the remainder of Guevara's works as other authors, Latin, French, and Italian*, 1577. The *Familiar Epistles* of Guevara had been published in English by Edward Fellowes in 1574; Fenton's collection consists of pieces not contained in that publication.

FENUGREEK (*Trigonella*), a genus of leguminous herbs very similar in habit and in most of their characters to the species of the genus *Medicago*. The leaves are formed of three obovate leaflets, the middle one of which is stalked; the flowers are solitary or in clusters of two or three, and have a campanulate, 5-cleft calyx; and the pods are many-seeded, cylindrical or flattened, and straight or only slightly curved. The fenugreeks or trigonels are widely diffused over the south of Europe, West and Central Asia, and the north of Africa, and are represented also by several species in Australia. Common Fenugreek, *T. Fœnum-græcum*, so called from the name given to it by the ancients, who used it as fodder for cattle, is indigenous to the Mediterranean region, and is cultivated to some extent in Thuringia, Moravia, and other parts of Europe, and in Morocco, and largely in Egypt and in India. It bears a sickle-shaped pod, containing from 10 to 20 seeds, from which 6 per cent. of a fetid, fatty, and bitter oil can be extracted by ether. In India the fresh plant is employed as an esculent. The seed is an ingredient in curry powders, and is used for flavoring cattle foods. It was formerly much esteemed as a medicine, and is still in repute in veterinary practice.

FEOFFMENT, in English law, was the form of granting or conveying a freehold or fee. One of its essential elements was *livery of seisin* (delivery of possession), which consisted in formally giving to the feoffee on the land a clod or turf, or a growing twig, as a symbol of the transfer of the land. This was called livery *in deed*. Livery *in law* was made not on but in sight of this land, the feoffer saying to the feoffee, "I give you that land; enter and take possession." By the 8 and 9 Vict. c. 106 feoffments were rendered unnecessary and superfluous. All corporeal hereditaments were by that Act declared to be *in grant* as well as *livery*, *i. e.*, they could be granted by deed without livery. And feoffments were in general required to be evidenced by deed.

FERDINAND. The name of Ferdinand (the Italian *Ferdinando* or *Ferrante*, Spanish *Fernando* or *Hernando*, Arabian *Ferdeland*), which is supposed to be of Gothic origin and to be allied to the German *verdienend* (meritorious), has been borne by a considerable number of European sovereigns, the more important of whom are noticed below in the following order—first, the emperors, and then the kings of Naples, Portugal, and Spain, the grand-dukes of Tuscany, and the duke of Brunswick.

---

[1] *The Dean of Lismore's Book*, ed. by Rev. T. M'Lauchlan and W. F. Skene, Edinburgh, 1862, p. 88 (translation), 64 (text).

FERDINAND I. (1503–1564), emperor, was the son of Philip of Austria and Joanna daughter of Ferdinand and Isabella of Spain, and was born at Alcala in Spain 10th March, 1503. In 1521 he married princess Anna of Hungary, and on the death in 1526 of her only brother the boy-king Louis of Bohemia and Hungary he was elected king of Bohemia, but in Hungary his claims were opposed by John Zapolya, palatine of Transylvania. Zapolya suffered a severe defeat from the imperial troops near Tokay; but after receiving the aid of the Turks he managed to carry on the struggle with varying success until 1538, when the exhausted resources of both rival parties led to a compromise, by which it was agreed that a half of the kingdom should be assigned to each, and that on the death of John the half over which he ruled should revert to Ferdinand. But on the death of John in 1540 the Turks supported the cause of his infant son John Sigismund, and in 1547 Ferdinand was compelled to purchase peace at the price of a yearly tribute. The war was again renewed in 1552, and at its termination the Turks were allowed to retain possession of a part of Hungary in trust for Sigismund. In 1521 Ferdinand had been chosen president of the council of regency appointed to govern Germany during the absence in Spain of his brother the emperor Charles V., and in 1531 he was, through the influence of his brother, elected king of the Romans, in which capacity he acted the part of mediator between the emperor and the German princes, and in 1552 negotiated a treaty between him and the elector Maurice of Saxony. On the abdication of Charles in 1556 Ferdinand was elected emperor. Pope Paul IV. refused ecclesiastical recognition to the election on the ground that it was made without the consent of the papal see, but happily Paul died before the dispute had time to lead to serious consequences, and his successor Pius IV. avoided an open rupture by recognizing its validity on condition that Ferdinand should not observe the treaty of Augsburg. Ferdinand during his short reign showed himself an able, just, and enlightened ruler. He reorganized the aulic council, effected a reform in the monetary system of Germany, and exerted himself to bring about a reconciliation between his Protestant and Roman Catholic subjects. To effect this he endeavored on the one hand to obtain from the pope various concessions to the Protestants, among others permission for the laity to use the cup at the communion, and liberty of marriage for the priests; and on the other hand he sought to persuade the Protestants to send deputies to the council of Trent; but his death, 25th July, 1564, prevented these negotiations having a satisfactory termination. See Bucholtz, *Geschichte der Regierung Ferdinands I.*, 9 vols., Vienna, 1831–38.

FERDINAND II. (1578–1637), emperor, was the grandson of the preceding and the son of Charles duke of Styria and of Mary of Bavaria, and was born at Gratz, 9th July, 1578. He was educated by the Jesuits, and having imbibed strong anti-Protestant sentiments is said to have taken a solemn vow before the altar that, on receiving the imperial crown, promised him by his cousin Matthias II., he would at whatever cost re-establish the Roman Catholic religion throughout all his states. In 1618 Matthias abdicated the thrones of Bohemia and Hungary in his favor, and on the death of Matthias in 1619 he laid claim to the imperial crown. His keen Roman Catholic sympathies, allied to a character gloomy, fanatical, and cruel, had already led him to disregard the guarantees of toleration by which his election to the thrones of Bohemia and Hungary had been acceded to; and on that account the Bohemians, shortly after the death of Matthias, rose in revolt, and under the leadership of Count Thurn besieged him in Vienna, until the arrival of an army under General Bouquoi forced them to retreat, and enabled him to proceed to Frankfort to receive the imperial crown. The Bohemians, notwithstanding their defeat, chose as their king the elector-palatine Frederick V., son of James I. of Scotland, and with the assistance of Bethlen Gabor, prince of Transylvania, who revolted against Ferdinand in Hungary, virtually inaugurated the long struggle for religious liberty known as the Thirty Years' War. Ferdinand, however, with the support of the Catholic league and the alliance of John George I., elector of Saxony, was able completely to subdue them after a short campaign, and having totally defeated them near Prague, November 8, 1620, he deprived them of their constitutional rights, banished the leading Protestant families, expelled the Reformed preachers and recalled the Jesuits, and by cruel persecutions totally quelled every manifestation of Protestant belief. But in Hungary he was not so successful as to enable him to put such extreme measures into execution; on the contrary, he thought it prudent to conclude a peace on the 31st of December, 1621, by which he agreed to cede one half of the country to Bethlen Gabor, and to grant religious toleration to the other half. In Germany fortune was for a time more favorable to the Roman Catholic cause; several of the German princes had entered into a league with Christian IV. of Denmark, but that monarch was defeated by Ferdinand's general, Wallenstein, and a peace between him and Ferdinand was concluded in 1629. Taking advantage of his opportunity, Ferdinand in the same year passed the famous Edict of Restitution, which enforced the restoration of all German ecclesiastical property that had passed into other hands since the treaty of Passau in 1552. The full execution of the edict was, however, prevented,—partly by the unwillingness of the Roman Catholic princes to give up the property of which they had become possessed, partly by the intrigues of Cardinal Richelieu, who was jealous of the increasing influence of the emperor, but principally through the arrival of Gustavus Adolphus. Uniting with the Protestant princes of Germany, Gustavus inflicted a succession of defeats on Ferdinand, who, having at the urgent representations of the Catholic princes dismissed Wallenstein from the command of the imperial army, possessed no general at all adequate to cope with the genius and energy of the king of Sweden. Gustavus was subsequently joined by the elector of Saxony, and fortune failed to smile on the arms of Ferdinand, even after the recall of Wallenstein, who was defeated at the battle of Lützen, 16th November, 1632. The victory was dearly bought by the death of the king of Sweden, but Wallenstein took little advantage of the great loss thus sustained by the Protestant cause; and the emperor, learning that he finally meditated treachery, caused him to be assassinated, February 25, 1634. In the same year the imperial army was successful at the battle of Nordlingen, and after this victory the elector of Saxony separated himself from the Swedish alliance and made peace with Ferdinand; but the Swedes continuing the struggle with great determination, and being afterwards joined by France, Ferdinand, when he died on the 15th February, 1637, was uncomforted by the hope of any near fulfilment of the purpose expressed in his oath, and attempted by such ruthless persecutions and at such an expense of treasure and of human life.

See Khevenhüller, *Annales Ferdinandi II.*; the various histories of the Thirty Years' War; Ranke, *Die Röm. Päpste,* vol. ii.; and Hurter, *Geschichte Ferdinands II.* This last is written from a Roman Catholic standpoint.

FERDINAND III. (1608–1657), emperor, the son of the preceding, was born at Gratz, 11th July, 1608. He became king of Bohemia in 1625, king of Hungary in 1627, king of the Romans in 1636, and succeeded his father as emperor in 1637. Milder in disposition, less fanatical in his opinions, and somewhat dispirited on account of the repeated defeats inflicted on the German arms by Duke Bernhard and General Baner, he was at an early period of his reign strongly desirous of obtaining peace even at the cost of liberal concessions to the Protestants; but the determination of France and Sweden to humiliate the imperial power prevented negotiations being entered into until 1643. Between that date and 1648 fruitless conferences continued to be held, the war meanwhile raging intermittently and with somewhat spent fury. In 1647, however, Ferdinand had guaranteed religious toleration to Hungary, and finally, on October 24, 1648, the Peace of Westphalia was signed, by which was brought to a close a war that, besides the evils inflicted by it on other countries, had desolated the whole of Germany, paralyzed its trade, and destroyed more than half its population. By this treaty religious liberty was secured to Germany, although not to Bohemia; France obtained part of Alsace and Lorraine, and the son of Frederick V. got the Upper

Palatinate; while Sweden obtained Western Pomerania, and became a member of the German diet. The unity of Germany was at the same time so broken up by concessions granted to the independent princes that with the death of Ferdinand III. the German kingdom may be said to have ceased to exist, until re-established by William I. after the Franco-Prussian war. During the peace negotiations of Westphalia, Ferdinand IV., eldest son of Ferdinand III., was chosen king of the Romans, but he died in 1654. Ferdinand III. died, April 2, 1657, shortly after concluding a treaty with the Poles against Sweden. See Koch, *Geschichte des Deutschen Reichs unter Ferdinand III.*, 1865.

FERDINAND I. (1793-1875), emperor of Austria, the eldest son of the emperor Francis I. by his second wife Maria Theresa, daughter of Charles VI., was born in Vienna, April 19, 1793. He inherited a constitution so weak as to unfit him for the duties of his station, but his amiable and benevolent disposition secured him general respect, and acquired for him the surname of the Good. On the 2d February, 1831, he married Princess Anne Caroline, third daughter of Victor Emmanuel of Sardinia, but the marriage was without issue. He was crowned nominal sovereign of Hungary under the title of Ferdinand V. in 1830, succeeded his father as emperor of Austria on the 2d March, 1835, and received the crown of Bohemia in 1836, and that of Lombardy in 1839. During his whole reign the government of Austria was virtually in the hands of Prince Metternich, who continued the conservative policy of Francis I. The revolution of the 13th March, 1848, compelled Metternich to resign office, and, the constitution not meeting with the approval of the revolutionists, Ferdinand fled to Innsbruck. At the urgent request of all parties, he shortly afterwards returned to Vienna, but on a renewal of the outbreak he left the capital for Olmütz in Moravia, where, feeling himself unfit to cope with the difficulties of government, he was persuaded to abdicate in favor of his nephew, Francis Joseph, 2d December, 1848. He spent the remainder of his life in retirement, chiefly at Prague in Bohemia, where he died 29th June, 1875.

FERDINAND I. (1423–1494), king of Naples, the illegitimate son of Alphonso V. of Aragon and I. of Sicily and Naples, was born in 1423. In accordance with his father's will, he succeeded him on the throne of Naples in 1458, but Pope Calixtus III. having refused to recognize him, John of Anjou, desirous to turn to advantage the opportunity of regaining the throne of his ancestors, invaded the country, and inflicted on him a severe defeat, July 7, 1460. Ferdinand fled to Naples accompanied by only twenty cavaliers, but having by certain concessions obtained recognition from Pius II., who about this time succeeded Calixtus on the papal throne, he received through him the aid of the Albanian chief Scanderbeg, and defeated John of Anjou at Troja with great loss, August 18, 1462. In 1480 the Turks captured Otranto from Ferdinand, and massacred the majority of the inhabitants, but in the following year it was retaken. The only other event of importance during his reign was an abortive attempt at revolt on the part of the nobles in 1485, many of whom, notwithstanding that he promised them a general amnesty, were afterwards treacherously murdered by his commands. On account of his refusing to pay to Innocent VIII. the census-tax promised by him to Pius II., he was in 1489 excommunicated, but he subsequently gained the favor of Alexander VI. He died 25th January, 1494, while Charles VIII. of France was preparing to invade his dominions. Though cruel in the infliction of punishment, and ready without scruple to break his promises when it suited him, Ferdinand generally dealt out to his subjects even-handed justice, favored the spread of knowledge, and greatly increased the industrial and commercial prosperity of his kingdom.

FERDINAND II., king of Naples, grandson of the preceding, and son of Alphonso II., was born probably in 1468. Alphonso, finding his tenure of the throne uncertain on account of the general dissatisfaction of his subjects, abdicated in his son's favor in 1495, but notwithstanding this the treason of a party in Naples rendered it impossible to defend the city against the approach of Charles VIII. Ferdinand fled to Ischia; but when the French left Naples, the Neapolitans, irritated by their conduct during the occupation of the city, recalled him; and with the aid of the great general of Ferdinand V. of Spain, Gonzalo de Cordova, he was able completely to rid his state of its invaders shortly before his death on the 7th October, 1496.

FERDINAND III. of Naples. See FERDINAND V. of Spain.

FERDINAND IV. (1751–1825) of Naples, III. of Sicily, and I. of the Two Sicilies, third son of Don Carlos, king of Naples (afterwards Charles III. of Spain), was born in Naples, January 12, 1751. When his father ascended the Spanish throne in 1759, Ferdinand, in accordance with the treaties which forbade the union of the two crowns, succeeded him on the throne of Naples, under a regency of which Bernardo Tanucci was the chief. On account of the ambitious purposes of Tanucci, who wished to retain the government of the kingdom as much as possible in his own hands, the education of the young king was very much neglected, while no restraint was put upon his love of pleasure, or his excessive preference for athletic exercises and outdoor sports. His minority ended on the 12th January, 1767, and in 1768 he married Maria Caroline, daughter of the empress Maria Theresa. According to the marriage contract the queen after the birth of her first son was to have a voice in the councils of state; and she was not backward to make use of this opportunity of political influence. Beautiful, clever, and ambitious, and inheriting many of the masculine characteristics of her mother, she soon ousted Tanucci both from the favor of the king and from all but nominal authority in the state; and when he systematically attempted to frustrate her purposes, he was finally in 1777 dismissed from his office. The Englishman Sir John Acton was shortly after this appointed admiral of the Neapolitan fleet, and succeeded so completely in winning the favor of both queen and court, that he was speedily promoted to be minister of war, and then of foreign affairs. Under his influence Spain lost her ascendency in Neapolitan politics, and an intimate connection was formed with Austria and England. In 1793 Ferdinand joined the coalition against France, and although he made peace with France in 1796, he took advantage of the absence of Napoleon in Egypt to renew the war in 1798. His army occupied Rome for a short time, but after the defeat of some of its divisions by the French, Ferdinand, without attempting to defend Naples, to which he had fled panic-stricken, escaped on board the English fleet under Admiral Nelson, and went to Palermo; and the French, entering the city after a furious but undisciplined resistence by the lazzaroni, established with the aid of the citizens and nobles the "Parthenopean Republic." When, six weeks after this, the defeat of their arms in the north of Italy compelled the French to abandon Naples, Ferdinand was restored by a Calabrian army under Cardinal Ruffo; and with the connivance of Admiral Nelson a reign of terror was inaugurated, which continued until the success of the French arms in 1801 induced Ferdinand to sign a treaty whereby, besides other concessions, he promised to grant an amnesty to political offenders, and also agreed to permit French troops to occupy his territories. But when war broke out between France and Austria in 1805, he thought the opportunity favorable for throwing off the French domination, and prompted by Caroline permitted 13,000 Russian and English troops to land at Naples. Scarcely had he done so, when the victory of Austerlitz enabled Napoleon to despatch an army against him. Ferdinand with his usual precipitation fled from his capital, leaving Caroline to negotiate terms with the enemy, but as Napoleon refused all further compromise with the house of Bourbon she was compelled to follow her husband into Sicily. On March 30, 1806, Joseph Bonaparte was proclaimed king of Naples and Sicily; but Ferdinand with the aid of England continued to reign over the latter kingdom. After the dethronement in 1815 of Murat, who had succeeded Joseph Bonaparte as king of Naples in 1808, Ferdinand was recalled to his capital, and on December 12, 1816, he united his two states into one, and assumed the title of king of the Two Sicilies. As a condition of his recall he had sworn to grant a constitution, but no sooner did he find himself secure from external interference than he abolished it; and although a revolution compelled him again in 1820 to give to it a nominal assent, he was shortly afterwards able, with the help of an Austrian army, to break his promises with impunity, and by means of an elaborate system of espionage and the unscrupulous arrest and punishment of all suspected persons to re-establish his despotism in a more vigorous form than ever. He died 4th. January, 1825.

See Botta, *Storia d'Italia dal 1789 al 1814*; Coletta, *Storia del reame di Napoli dal 1734 sino al 1825*, 2 vols., 1834, English translation, 1858; *Sketch of Popular Tumults*, 1837; and *Mémoires du Général Pepe*, 1847.

FERDINAND II. (1810–1859), king of the Two Sicilies, grandson of the preceding, and son of Francis I., was born at Palermo, January 12, 1810. On succeeding his father in 1830, he published an edict in which he promised to "give his most anxious attention to the impartial administration of justice," to reform the finances, and to "use every effort to heal the wounds which had afflicted the kingdom for so many years;" but these promises seem to have been meant only to lull discontent to sleep, for while the existing burden of taxation was only slightly lightened, corruption began gradually to invade all departments of the administration, and an absolutism was finally established harsher than that of all his predecessors, and supported by even more extensive and arbitrary arrests. Ferdinand was naturally shrewd, but badly educated, grossly superstitious, and possessed of inordinate self-esteem. Though he kept the machinery of his kingdom in a high state of efficiency, he made little account of the wishes or welfare of his subjects, and did not deem it of much importance to be on good terms either with them or with foreign states. In 1832 he married Christina, daughter of Victor Emmanuel, and shortly after her death in 1836 he took for a second wife Maria Theresa, daughter of Archduke Charles of Austria. After his Austrian alliance the bonds of despotism were more closely tightened, and the increasing discontent of his subjects was manifested by abortive attempts at insurrection in 1837, 1841, 1844, and 1847, and in 1848 by a general rising in Sicily, on account of which the king judged it prudent to promise a constitution. A dispute, however, arose as to the nature of the oath which should be taken by the members of the chamber of deputies, and as neither the king nor the deputies would yield, serious disturbances began to occur in the streets of Naples; and the king, making these the excuse for withdrawing his promise, on the 13th March, 1849, dissolved the national parliament. The efforts at revolt were renewed in Sicily, but were speedily quelled, chiefly by the bombardment of the principal cities of the state, an expedient which won for Ferdinand the epithet of "Bomba." During the last years of his reign espionage and arbitrary arrests prevented all serious manifestations of insubordination among his subjects. In 1851 the political prisoners of Naples were calculated by Mr. Gladstone to number 13,000, and so great was the scandal created by the rule of terror which prevailed that in 1856 France and England, though vainly, made diplomatic representations to induce a mitigation of its rigor and the proclamation of a general amnesty. An attempt was made to assassinate Ferdinand in 1857. He died May 22, 1859.

See *Correspondence respecting the Affairs of Naples and Sicily, 1848–49, presented to both Houses of Parliament by command of Her Majesty*, 4th May, 1849; *Two Letters to the Earl of Aberdeen*, by the Right Hon. W. E. Gladstone, 1st ed. 1851 (an edition published in 1852, and the subsequent editions, contain an *Examination of the Official Reply of the Neapolitan Government*); supplementary chapter to the English translation of Coletta's *History of Naples*; and Dawburn, *Naples and King Ferdinand*, 1858.

FERDINAND I. of Portugal (1345–1383), sometimes referred to as *el Gentil* (the Gentleman), son of Pedro I. of Portugal (who is not to be confounded with his Castilian contemporary Pedro the Cruel), succeeded his father in 1367. On the death of Pedro of Castile in 1369, Ferdinand, as great-grandson of Sancho IV. by the female line, laid claim to the vacant throne, for which the kings of Aragon and Navarre, and afterwards the duke of Lancaster (married in 1370 to Constance, the eldest daughter of Pedro), also became competitors. Meanwhile Henry of Trastamara, the brother (illegitimate) and conqueror of Pedro, had assumed the crown and taken the field. After one or two indecisive campaigns, all parties were ready to accept the mediation of Pope Gregory XI. The conditions of the treaty, ratified in 1371, included a marriage between Ferdinand and Leonora of Castile. But before the union could take place the former had suddenly become passionately attached to Leonora Tellez, the wife of one of his own courtiers, and having procured a dissolution of her previous marriage, he lost no time in making her his queen. This strange conduct, although it raised a serious insurrection in Portugal, did not at once result in a war with Henry; but the outward concord was soon disturbed by the intrigues of the duke of Lancaster, who prevailed on Ferdinand to enter into a secret treaty for the expulsion of Henry from his throne. The war which followed was unsuccessful; and peace was again made in 1373. On the death of Henry in 1379, the duke of Lancaster once more put forward his claims, and again found an ally in Portugal; but, according to the Continental annalists, the English proved as offensive to their companions in arms as to their enemies in the field; and Ferdinand made a peace for himself at Badajoz in 1382, it being stipulated that Beatrix, the heiress of Ferdinand, should marry King John of Castile, and thus secure the ultimate union of the crowns. On the death of Ferdinand at Lisbon in the following year (22d October, 1383), leaving no male issue, the direct Burgundian line, which had been in possession of the throne since the days of Count Henry (about 1112,) became extinct. The stipulations of the treaty of Badajoz were set aside, and John, grand-master of the order of Aviz, Ferdinand's illegitimate brother, was proclaimed. This led to a war which lasted for several years.

FERDINAND I. of Aragon and Sicily (1379–1416), surnamed the Just, the younger son of John I. of Castile and Leonora of Aragon, was born in 1379. On the death of his elder brother Henry III. in 1406, he refused the crown of Castile which the nobles had offered, but in accordance with his brother's will undertook the office of regent during the minority of his nephew John II. In this capacity he distinguished himself by his prudent administration of home affairs, and by his victories over the Moors by land and sea. He took the title *de Antequera* on the surrender of that fortress after a siege of five months (1410). On the death of his maternal uncle, King Martin of Aragon and Sicily, his claims to the throne, though not derived from the usual laws of descent, were taken up and keenly pressed by a powerful party in the state. The question of the succession was ultimately referred to a committee of nine judges equally representing Catalonia, Valencia, and Aragon; and the result was his election by a majority (1412). After he had defeated, at Balaguer, Count Jayme of Urgel, the last and most formidable of his rivals, he was formally crowned at Saragossa in 1414.

From the year 1378 Europe had been scandalized by the spectacle of the papal schism; and since 1410 three rival popes had been claiming the obedience of the faithful. At the council of Constance in 1414, Ferdinand of Aragon was a prominent supporter of the Spaniard, Benedict XIII. (Peter de Luna), who had been deposed at Pisa in 1408. The deposition of John XXIII., and the abdication of Gregory XII. in 1415, having paved the way for peace, Ferdinand consented to be present at the meeting of Sigismund with the ambassadors of France, Castile, and Navarre in Perpignan; and after long temporizing he ultimately agreed, for the sake of the unity of the church, to withdraw his obedience from Luna. He died in the following year at Ygualada (2d April, 1416), and was succeeded by his son Alphonso V., the conqueror of Naples.

See Zurita, *Anales de la Corona de Aragon*, xi., xii.; Mariana, *Hist. Gen.*, xix. 15–xx. 8.

FERDINAND II. of Aragon and Sicily. See FERDINAND V. of Castile.

FERDINAND I. (*cir.* 1000–1065), surnamed the Great, first sovereign of independent Castile, was the second son of Sancho III. (el Mayor) of Navarre, who about 1026 compelled Bermudo III. of Leon, the last direct descendant of Pelayo in the male line, to surrender his rights over Castile, and also to give his sister Sancha in marriage to Ferdinand, then regent of that province. Sancho, towards the close of his energetic life, divided his extensive dominions among his four sons, Castile being the portion allotted to the second (1035). Bermudo of Leon, shortly after Sancho's death, sought to recover his lost possessions, but was defeated and slain in the attempt at Lantada near Rio Carrion (1038). Ferdinand, now king of Leon as well as of Castile, by a conciliatory yet firm policy, soon established his authority over his conquered subjects; and when in 1053 his dominions were invaded by his brother Garcia III. of Navarre, the attack issued in the death of the latter on the battlefield of Atapuerca near Burgos, and the annexation of a large portion of his dominions. At an early period of his reign Ferdinand began to direct his arms against the Moors; and by a series of successful campaigns he extended the Christian frontier from the Douro to the Mondego, and reduced to vassalage the emirs of Toledo, Saragossa, and Seville. Even the Arab chronicles mention his victories from Badajoz in Estremádura to Albarracin in Aragon (Gayangos, *Mohammedan Dynasties in Spain*, vol. ii.). He had set out on an expedition against Valencia when he was seized with a mortal illness which compelled him to retire to his capital (Leon), where, after having divided his dominions among his three sons, he died on the 27th of December, 1065. Ferdinand appears to have laid claim to the title of "emperor" of Spain; and Mariana alleges that at a council held at Florence in 1055 the emperor Henry III. lodged a formal complaint against this infringement of his rights of suzerainty, that this complaint was sustained by Pope Victor II., but that at a conference afterwards held at Toulouse a decision favorable to Ferdinand's imperial rights, so far they related to the territories which had been conquered from the Moors, was given, chiefly in consequence of the representations made by the famous Cid, Ruy Diaz de Bivar. Though this statement can only be received with reserve, it is certain that both in virtue of the ascendency he won for himself in Christian Spain, and also in virtue of his very considerable successes over the Moors, Ferdinand I. is fully entitled to the rank which tradition has assigned to him among the greater Spanish sovereigns.

See Mariana's *Historia General de España*, IX. i.–vi.

FERDINAND II. (1136–1188), younger son of Alphonso VIII. (el Emperador), became king of Leon on the death of his father in 1157. The history of his reign of thirty-one years is obscure. A dispute that arose between him and some of his powerful nobles gave his brother Sancho III. of Castile a pretext for invading his territory (1158), but the timely submission of Ferdinand averted serious disaster. The death of Sancho shortly afterwards led to a military occupation of Castile by Ferdinand, professedly in the interests of his nephew Alphonso III.; and this occupation lasted till the marriage of Alphonso to Leonora, daughter of Henry II. of England, in 1170. Meanwhile Ferdinand, having repudiated his wife Doña Urraca, had become involved in a war with his father-in-law Alphonso I. of Portugal, which resulted in the defeat and capture of the latter at Badajoz in 1169. The later years of the reign of Ferdinand II. were distinguished by sundry successes over the Moors, especially by a brilliant victory at Santarem (*cir.* 1181); and also by the incorporation of the great military order of Alcantara, which received its first regular charter from Pope Alexander III. in 1177. He died at Benavente (Leon) in 1188, and was succeeded by his son Alphonso IX.

Mariana, *Hist. Gen. de España*, XI. v., viii., xiii., xvi.; Gayangos, *Mohammedan Dynasties*, ii. 522.

FERDINAND III. (1200–1252), usually known as Saint Ferdinand, was the son of Alphonso IX. of Leon, and of Berenguela, sister of Henry I. of Castile. On the death of Henry without issue in 1217, the just title of Blanche, the elder of the surviving sisters, was set aside and Berenguela procured the proclamation of Ferdinand. He rapidly secured the homage of the towns and the submission of the nobles, especially of the brothers Alvaro and Fernando de Lara. On the death of his father in 1230 he ultimately, though not without dispute, became king of Leon as well as of Castile, thus finally uniting the two kingdoms under one crown. Following up the advantage which had been gained for the Christian arms by his father and the allied kings in the great battle at Las Navas de Tolosa in 1212, he devoted all his energies to the prosecution of the Moorish war. Among his conquests may be mentioned those of Ubeda in 1234, of Cordova in 1236, of Jaen in 1245, and of Seville in 1248. He was planning an invasion of Africa when he died at Seville on the 30th of May, 1252, leaving his kingdom to his eldest son Alphonso X. (Alonso el Sabio).

Though not canonized till centuries afterwards (by Clement X. in 1671), he came to be popularly known as *el Santo* from a very early period. Distinguished though he was for great military talent, he was still more remarkable for his religious zeal. Like his younger cousin Saint Louis of France, he was supremely a champion of the Catholic faith. It was not on the field of battle alone that his ardor was displayed. His Spanish panegyrists never fail to relate how it was his wont to assist in carrying wood for burning the followers of the Albigensian heresy, and how sometimes with his own royal hands he applied the torch to the pile.[1] While as a crusader he is hardly eclipsed by Louis, he contrasts very favorably with him, as a sincere friend of learning. He was the original founder (1243) of the university of Salamanca, which his son and successor did so much to foster and encourage. He it was also who caused to be translated into the vulgar tongue the *Fuero Juzgo* (Forum Judicum) or code of Visigothic laws, which as collected and translated at his instance has the double interest of being one of the oldest extant specimens of Castilian prose, and also of being the foundation of *Las Siete Partidas*, the code for Christian Spain, which was finally drawn up by Alphonso the Wise.

His body now lies in the Capilla Real of Seville Cathedral, where it is exhibited as a relic on certain annual occasions (in May, August, and November). His day in the Spanish calendar is May 30.

See Mariana, *Hist. Gen.*, XII. vii.–XIII. viii.; and compare Conde, *Dominacion de los Arabes en España*, IV. iii.–vi.

FERDINAND IV. (1285–1312), sometimes called *el Emplazado*, *i.e.*, Cited or Summoned, succeeded his father Sancho IV. on the throne of Castile and Leon in 1295. The years of his minority were disturbed by a series of civil wars caused by the pretensions of his cousins Don Juan and Don Alonso de la Cerda to the crown, by the disputes of the Haros, Laras, and other nobles about their privileges, by the restlessness of the municipalities, and by the ambition of the neighboring kings of Portugal, Aragon, and Granada. The queen-mother, Maria de Molina, on each new outbreak succeeded in procuring peace by diplomatic tact and judicious compromise. Secure at last in possession of his throne, Ferdinand was free to pursue the traditional policy of war against the Moors; and in carrying it out he was aided by pecuniary grants both from his own nobles and also from the pope (Clement V.), as well as by the spoils of the Templars on the extinction of that order in 1310. His chief exploit, as recorded by the historians, both Spanish and Arab, was the expedition against Algeciras (1309), which, while unsuccessful in its main object, resulted in the surrender of Gibraltar and the cession of other strongholds (Gayangos, ii. 348; Conde, IV., xiv.). In the course of a subsequent campaign he died suddenly at Jaen, September 7, 1312. According to Mariana, he had on the 8th of August preceding condemned to death without lawful trial two brothers of the name of Carvajal. These protesting their innocence had summoned him to meet them within thirty days at the bar of God; hence his surname. He was succeeded by his infant son Alphonso XI. (See Mariana, XV. i.–xi.)

FERDINAND V. of Castile, III. of Naples, II. of Aragon and Sicily, surnamed *el Catolico* (1452–1516), the younger son of John II. of Navarre and Aragon by his second wife Juana Henriquez of Castile, was born at Sos in Aragon on the 10th of March, 1452. On the death of his elder brother Carlos in 1461, he was recognized by the Aragonese as heir-apparent to the crown, but the Catalans, rendered indignant by the cruelty and perfidy with which Carlos had been treated, refused to recognize any further claim on their allegiance, and rose in rebellion against King John. Ferdinand accompanied his father in the campaigns which followed, and gave early promise of distinction. In 1466 his father formally associated him with himself in the government of Aragon, and in 1458 declared him king of Sicily. In October, 1469, he was married at Valladolid, in circumstances of unusual secrecy, to Isabella, sister of Henry IV. of Castile, and heiress to that throne. On the death of Henry IV. in 1474, Ferdinand and Isabella were recognized by the nobles in the junta of Segovia as joint sovereigns of Castile; but a powerful party, including the marquis of Villena, the grand-master of Calatrava, the archbishop of Toledo, and numerous other notables, as well as some of the burghs, declared in favor of Juana "la Beltraneja" (*i.e.*, daughter of Beltran), whom Henry had shortly before his death recognized as his own child, and by his will desig nated as his successor. Juana had also the support of Alphonso V. of Portugal (to whom she was betrothed in 1470) and of Louis XI. of France. The result was a civil war which continued with varying fortunes until victory finally declared for the Catholic sovereigns, and the peace of Lisbon was signed in 1479. In the same year, a few months previously, Ferdinand had succeeded his father on the throne of Aragon, though not on that of Navarre, which went to his sister Leonora de Foix. The union of Castile and Aragon, together with the prosperous termination of the civil war, gave the Catholic sovereigns leisure and opportunity for the development of a vigorous domestic policy. On their accession they had found themselves face to face with an almost anarchical condition of affairs; bitter feuds were raging in Andalucia between the great houses of Cadiz and Medina Sidonia; Galicia and other provinces were rent with hostile factions; robbery and outrage were paralyzing commerce and agriculture throughout the kingdom. One of their earliest measures for restoring the much-needed order was the reorganization and development (1476) of the ancient *hermandad* (brotherhood), a league which had been originally formed by some of the cities for mutual protection against the aggression of the nobles and of the crown, and which had already more than once, by means of its "cortes extraordinary," made its power to be felt. It was now augmented and mobilized as a body of military police for the detection and repression of all crimes against person or property committed on the highways or in the open country. For these ends it proved very useful; and also for another purpose, which is believed to have been aimed at in its constitution, that of checking the arrogance and rapacity of the feudal aristocracy. The next step for the avowed purpose of securing orderly government was the institution of the famous Inquisition as a tribunal for the repression of heresy (and, as some historians do not hesitate to add, for the extortion of money). The necessary bull was obtained from Sixtus IV. in 1478; the court was instituted at Seville in 1480, where the first *auto de fe* took place in the following year. The arrangement was extended to Aragon in 1483, Torquemada being appointed first inquisitor-general. Among other measures taken by Ferdinand and Isabella for the consolidation of their power were the assumption of the grand-masterships of the three great military orders of knighthood, and the vindication from papal usurpation of their ancient rights of ecclesiastical patronage. One result of their firm and on the whole wise policy was that between the years 1477 and 1482 the revenue of the country had been augmented nearly six-fold, and that in 1481 they were free to resume the long-suspended war against the Moors. From the capture of Alhama to the fall of Granada in 1492 (1st January), the Christian arms had met with a series of uninterrupted successes which resulted in the final extinction of the Mahometan power in Spain,—the Moors, however, being permitted the enjoyment of certain stipulated privileges, that of the free exercise of their religion being one. In March, 1492, the edict for the expulsion of the Jews was signed at Granada, and it was on the 3d of August in the same year that Columbus sailed from Palos in Andalucia, landing on the island of San Salvador on the 12th of October. In 1493 Ferdinand began to look abroad and take a practical interest in European affairs. By the treaty of Senlis he secured from Charles VIII. the restoration of Roussillon (now the department of Pyrénées Orientales) and of Cerdagne (now part of Catalonia), which had been mortgaged by John II. of Aragon to Louis XI. In 1494, Charles VIII. having undertaken his great Italian expedition, Ferdinand entered into an alliance with the emperor, the pope, and the states of Milan and Venice, and thus gained a footing in Italy for the Spanish troops, which, under Gonsalvo de Cordova, succeeded in expelling Charles from Naples in 1496. By the peace of 1498, however, the throne of that kingdom was left in possession of Frederick. In 1499 the liberty of worship which had been guaranteed to the Moors of Granada was treacherously withdrawn; serious risings in the Alpujarras (Sierra Nevada) were the consequence (1501); a decree was issued in 1502 offering to the conquered insurrectionists the alternatives of baptism or exile; and, the latter being usually chosen, Spain had to suffer a second time the loss of many of her most useful subjects. The Neapolitan war again broke out in 1500, and an alliance was formed between Ferdinand and Louis XII. on the basis of a partition of their conquests. This pact was broken by Ferdinand, who by the battles of Cerignola and Garigliano became sovereign of Naples (Ferdinand III.) in 1504. The death of Isabella took place on November 23d of the same year; and in accordance with her will Ferdinand immediately caused his daughter Juana to be proclaimed queen and himself regent. Philip archduke of Austria, the husband of Juana, having disputed the rights of his father-in-law and threatened an appeal to arms, the latter in disgust, with the view of again separating the crowns of Aragon and Castile, entered into negotiations with Louis XII., married Germaine de Foix, the niece of Louis (1505), and shortly afterwards resigned the regency of Castile. On the death of Philip in 1506 he resumed the administration, though not without opposition, and retained it till his death. In 1508 he joined the league of Cambray for the partition of Venice, and thus without any trouble became master of five important Neapolitan cities. In the following year (1509) the African expedition of Cardinal Ximenez was undertaken, which resulted in the conquest of Oran. In 1511 Ferdinand joined Venice and Pope Julius II. in a "holy league" for the expulsion of the French from Italy. This gave a pretext for invading Navarre, which had entered into alliance with France, and been laid under papal interdict in consequence. Aided by his son-in-law, Henry VIII. of England, who sent a squadron under the marquis of Dorset to co-operate in the descent on Guienne, Ferdinand became master of Navarre in 1513; and on the 15th of June, 1515, by a solemn act in cortes held at Burgos, he incorporated it with the kingdom of Castile. He died at Madrigalejo (Estremadura) early in the following year, 23d January, 1516. It is said that his death was accelerated by a potion which in his desire for posterity he had taken in order to reinvigorate his exhausted constitution. He was succeeded by his grandson, Charles I. of Spain, more generally known by his European title as the emperor Charles V.

---

[1] Thus Calderon, in his *Auto Historial Alegorico* entitled *El Santo Rey Don Fernando* (Madrid, 1690), introduces Ferdinand as declaring to St. Dominic his firm determination to apply the cautery which alone can cure the cancer of heresy. He is ready to have his own arm destroyed should it fail him in this duty. Compare Mariana, *Hist. Gen.*, XII. xi.

Though by no means a great general, Ferdinand possessed undoubted military capacity; though not a great statesman, he had abundant political skill. The largeness of his ambition was somewhat incongruously associated with a narrowness of view which showed itself very unfortunately for Spain in many instances, particularly in his treatment of the Moors and Jews, and with a smallness of nature which suffered him to treat with neglect his most faithful servants and greatest benefactors, such as Columbus, Navarro, and Ximenez himself. Yet his name is inseparably associated with the most splendid of all periods in the annals of Spain. It was under his guidance that the kingdom was consolidated and grew into its position of highest prosperity and greatest influence as a European power. And this must be admitted even when it is remembered that few sovereigns have been associated with such consorts as Isabella was, or surrounded by a band of men so distinguished as were Mendoza, Talavera, Ximenez, Gonsalvo de Cordova, and Pedro Navarro.

See Zurita, *Anales*, tom. v. and vi.; Mariana, *Hist. Gen.*, xxiii.–xxx.; and Prescott's brilliant *History of the Reign of Ferdinand and Isabella.*

FERDINAND VI. (1713–1759), king of Spain, sometimes called the Sage, the younger son of Philip V. and Maria Louisa of Savoy, was born at Madrid, September 23, 1713. On the death of his elder brother Louis in 1725, Ferdinand was proclaimed prince of the Asturias; and in 1729 he was betrothed to Barbara, daughter of John V. of Portugal. He succeeded his father on July 9, 1746. Since 1739 Spain had been involved in protracted war, first with England in consequence of disputes relative to British interests in the West Indies, and afterwards, since 1740, with Austria on the accession of Maria Theresa. It was Ferdinand's first endeavor on coming to the throne to secure peace for his exhausted country, and one of the earliest acts of his government was to order the withdrawal of the Spanish troops from Italy (August, 1746). Soon afterwards negotiations were opened for peace with England; and these, though frequently interrupted, ultimately resulted in the treaty of Aix-la-Chapelle, which terminated the war of the Austrian succession, thus restoring peace to Europe (October, 1748). Weak in health and despondent in temperament, Ferdinand had no inclination thenceforward to take an active part in European affairs, and the management of the public business he abandoned almost entirely to his ministers Ensenada, Carvajal, and Wall. These, however, always found it necessary to take into their counsels the queen, to whom

Ferdinand was much attached, the royal confessor Rabago, and the singer Farinelli, whose musical powers had given him extraordinary influence. During this reign the condition of Spanish finance was much improved; agriculture, commerce, and the arts were encouraged; by a concordat with Pope Benedict XIV., in 1753, many abuses of ecclesiastical patronage were reformed; nor were the affairs of the army and navy neglected. On the outbreak of the Seven Years' War in 1756, Spain steadfastly maintained a strict neutrality, notwithstanding the repeated efforts both of France and of England to secure her intervention, the former offering Minorca and the latter Gibraltar as the price of her assistance. On the death of his consort in 1758, Ferdinand fell into a profound melancholy, which issued in a confirmed insanity, under which he died at Villaviciosa on the 10th of August, 1759. Leaving no issue, he was succeeded, in terms of the treaty of Aix-la-Chapelle, by his half-brother Charles III. Though he was in no sense an able sovereign, and was remarkable for nothing unless for a pacific and kindly disposition, his reign was an exceptionally prosperous one for Spain, and critics generally concur in the observation of Coxe that, "since the elevation of the house of Bourbon to the throne of Spain, no period occurs in which the interests and independence of the kingdom were so well and so consistently supported as during the reign of Ferdinand VI."

See Coxe, *Memoirs of the Kings of Spain of the House of Bourbon*, chaps. 48–58.

FERDINAND VII. (1784–1833), king of Spain, the eldest son of Charles IV. and of Maria Louisa of Parma, was born at San Ildefonso, October 14, 1784, and became prince of the Asturias on the accession of his father in 1788. The year of his birth had also been the year of Godoy's arrival at court (see ALCUDIA); and the sinister influences of the royal favorite soon began to manifest themselves there. Ferdinand from a very early age learned to dislike Godoy, and he found many to sympathize with him in his not unnatural aversion. In 1802 he was married to Maria Antonietta, daughter of the king of Naples, and she, along with his former tutor Escoiquiz, the dukes of San Carlos, del Infantado, and others, fostered in him the spirit of resistance to the ascendency of "the Prince of the Peace." Soon after her death in 1806 (attributed by him, though without sufficient evidence, to foul play), and the forcible removal of Escoiquiz, the court became openly divided into two hostile factions; but though Godoy had the entire confidence of the king and queen, Ferdinand had the almost undivided sympathies of the people. On the 30th of October, 1807, he was suddenly laid under arrest on a charge of conspiracy against the crown and life of his father; but no documentary evidence against him could be produced, except a draft memorial, apparently intended for presentation to the king, in which the conduct of Godoy was bitterly complained of, and a letter to Napoleon appealing for protection, and expressing a desire to enter into a matrimonial connection with the Bonaparte family. When it was found that the French ambassador had been cognizant of these intrigues, the matter was hushed up and Ferdinand pardoned; but meanwhile the rapid movement of events, political and military, had begun to make Godoy's position an extremely precarious one. Ostensibly following out the terms of the agreement at Fontainebleau of October 27, 1807, Napoleon had not only invaded Portugal, but had also begun to pour troops into Spain (December, 1807). The Spanish people were beginning to show signs of restiveness, and, dreading an outbreak, Godoy had advised the withdrawal of the king and queen to Seville with a view to the possible necessity for a further flight to Mexico. But before this project could be carried out the revolutionary rising at Aranjuez had taken place (March 17–18, 1808), which resulted in the forced abdication of Charles, the final overthrow of Godoy, and the enthusiastic proclamation of Ferdinand as king (19th March). This last proceeding had been no part of Napoleon's plan; and Madrid was occupied four days afterwards by the French troops under Murat. By the representations of the latter, both Charles and Ferdinand were induced to seek a personal interview with Napoleon at Bayonne, and submit to his arbitration their rival claims. The result was the treaty of Bayonne between Charles and Napoleon (5th May, 1808), by which the former finally renounced the Spanish throne. Next day Ferdinand also was compelled to give up his claims; it was declared that the Bourbons had ceased to reign in Spain; and shortly afterwards Joseph Bonaparte was proclaimed king. Ferdinand was now interned at Valençay (Indre), where he remained during the whole of the Spanish war of independence, receiving from Napoleon an annual allowance of 600,000 francs. The letters he wrote to Napoleon from his captivity were certainly far from indicating patriotism: most people will doubt whether they were consistent with any self-respect. He had nothing but compliments to offer on the accession of Joseph; he assured his master of his ardent prayers for his prosperity, and of his most respectful and absolute attachment to his august person; he wrote to public men to say, "My highest desire is to prove myself to be the emperor's adopted son, by my entire submission and obedience to his wishes and desires."

The decisive victory of Wellington at Vittoria (21st June, 1813), followed up by the invasion of France, induced Napoleon to treat with his captive on terms more nearly approaching those of equality (November, 1813), and ultimately the title of Ferdinand and his dynasty to the throne of Spain was recognized on his agreeing to sign a convention in which it was undertaken on his part to expel the English from the Peninsula, to pardon all those who had given their obedience to Joseph Bonaparte, and to restore the harmonious relations of the two kingdoms as these had subsisted prior to 1792. On his return to Spain in March, 1814, the cortes declined to recognize him until he should have sworn to the constitution which had been promulgated at Cadiz in 1812; but, listening to the counsels of the "servile" party, he first evaded and afterwards rejected this demand. On the 4th of May he, by the decree of Valencia, annulled the constitution of 1812 and all enactments made by the cortes in his absence; on the 30th of the same month he issued his decree of proscription and perpetual exile against the *afrancesados*, or those who had given obedience to Joseph Bonaparte; on the 21st of July he re-established the Inquisition, with all the powers it had possessed under Torquemada, and began a hot crusade against "liberalism" or "constitutionalism," in which no weapon of confiscation, or imprisonment, or banishment, or execution, which despotism could wield was left unemployed. This policy of the absolutist "camarilla" was for some time interrupted by a revolutionary party headed by Quiroga and Riego at Cabezas de San Juan near Cadiz, which, on the 1st of January, 1820, caused the constitution of 1812 to be again proclaimed. The insurrection gaining daily in strength, the king was compelled to make concession after concession, until at length on the 9th of March he solemnly professed his entire acceptance of the popular constitution, abolished the Inquisition, banished the Jesuits, and restored the freedom of the press. The cortes reassembled, and the citizens who had been banished reappeared. But very soon the king began to show how insincere his submission had been. Sometimes secretly, sometimes openly, he did all in his power to encourage the opposition, until at last, in July, 1822, the royal guard broke out into open revolt with cries for "the absolute king." For the time they were repressed by the constitutionalists; but meanwhile the state of the Peninsula had attracted the attention of the Holy Alliance, and at the congress of Verona (August 25 to December 14, 1822) it was agreed to send a French army into Spain, "to deliver Ferdinand from slavery." Madrid was entered on May 23, 1823; the cortes withdrew to Seville, where Ferdinand was declared incapable of governing, and a regency was appointed (11th June). Driven by the invaders to Cadiz, and there compelled to surrender, the cortes yielded up their authority into the hands of Ferdinand, who in his turn promised a general amnesty to all who had been concerned in the revolutionary proceedings. This promise he broke the very next day, annulling every act of his government since 7th March, 1820. Another period of proscriptions, banishments, and fusillades now set in. Enactments of the most tyrannical description were unscrupulously made with the avowed purpose of stamping out the last spark of constitutionalism.[1] Numbers were put to death for the most trivial offences, and it has been estimated that some 20,000 families were compelled to leave their country. Louis XVIII. offered counsels of moderation; he reminded Ferdinand that "Christian princes ought not to rule by means of proscriptions," and that "a blind despotism, far from consolidating the power of sovereigns, weakens it;" but his remonstrances were in vain. His successor Charles X. used similar language; but Ferdinand's reply was that he was not able to control the reactionary party which had restored him to power. During the later years of his life he took little or no interest in public affairs; and the absolutists began to turn their attention to the question of the succession. A scheme was matured for inducing the king to abdicate in favor of his brother Don Carlos; but on the death of his third wife Maria Amalia of Saxony in May, 1829, without issue, Ferdinand filled the "apostolicals" with consternation and the liberals with new hope by contracting a fourth marriage with Maria Cristina of Naples (December, 1829). In March, 1830, the king decreed the abrogation of the Salic law,—a measure which excited the Carlists first to intrigue and afterwards to open insurrection on the birth of a daughter in October. In 1832 Ferdinand was seized with a threatening illness, and wavered from his formerly expressed will with regard to the succession; but ultimately, in June, 1833, his daughter (Isabella II.) was declared his successor, Cristina was nominated as regent, and Don Carlos with many of his followers was ordered to leave the kingdom. The death of Ferdinand at Madrid, September 29, 1833, was the signal for the outbreak of a long and bloody civil war.

---

[1] Thus the decree abolishing popular election of the ayuntamientos (17th October, 1824) was expressly made "con el fin de que desaparezca para siempre del suelo Español hasta la mas remota idea de que la soberanía reside en otro que en mi real persona."

Ferdinand's selfishness, hypocrisy, mendacity, incapacity to understand even the idea of patriotism, have sometimes suggested a comparison with Charles I. of England. But such a comparison is unjust to Charles. Ferdinand was a Spanish Bourbon, and in him the characteristic qualities of that house reached their final perfection — "imbecility, dissoluteness, ferocity, mutual hate, intellect never reaching higher than cunning, with a religion that was the fetichism of a savage rather than the creed of a rational being."[1] His reign was a disastrous one for Spain. Its results may be summed up as follows —loss of her American possessions—New Granada, New Spain (Mexico), Rio de la Plata, Chili, Venezuela, Guatemala, and Peru; hopeless financial embarrassment; thousands of her best citizens put to death for political opinions; myriads banished; and a quarter of a million slain in unnecessary wars.

FERDINAND I. and II., grand-dukes of Tuscany. See MEDICI.

FERDINAND III. (1769–1824), grand-duke of Tuscany, and archduke of Austria, second son of the emperor Leopold II., was born on the 6th May, 1769. On his father becoming emperor in 1790, he succeeded him as grand-duke of Tuscany. Ferdinand was the first sovereign to enter into diplomatic relations with the French republic; and although afterwards compelled by England and Russia to join the coalition against France, he concluded peace with that power in 1795, and by observing a strict neutrality saved his dominions from invasion by Napoleon till 1799, when he was compelled to vacate his throne, and a provisional republican government was established at Florence. Shortly afterwards the French arms suffered severe reverses in Italy, and Ferdinand was restored to his territories, but in 1801 Tuscany was converted into the kingdom of Etruria, and he was again compelled to return to Vienna. In lieu of the sovereignty of Tuscany, he obtained in 1802 the electorship of Salzburg, which he exchanged in 1805 for that of Würzburg. In 1806 he was admitted as grand-duke of Würzburg to the confederation of the Rhine. He was restored to the throne of Tuscany, after the abdication of Napoleon in 1814, but had again to vacate it for a short time in 1815, when Murat proclaimed war against Austria. The final overthrow of the French supremacy at the battle of Waterloo secured him, however, in the undisturbed possession of his kingdom during the remainder of his life. The mild and righteous rule of Ferdinand, his solicitude for the welfare of his subjects, his enlightened patronage of art and science, his encouragement of commerce, and his sympathy with freedom render him an honorable and striking exception to the generality of Italian princes. He died on the 18th of June, 1824.

FERDINAND (1721–1792), duke of Brunswick, a famous Prussian general, the fourth son of Duke Ferdinand Albert of Brunswick, was born at Brunswick, 11th January, 1721. He was educated for the military profession, and having entered the Prussian service, commanded a regiment in the first and second Silesian wars. On the outbreak of the Seven Years' War he was appointed to the command of a division, and he greatly contributed to the victory of Prague in 1757. He shortly afterwards received from George II. of England the supreme command of the allied forces, and for five years, by his energy, rapidity of movement, and masterly strategy, succeeded, notwithstanding the fewness of his troops and their very mixed and heterogeneous composition, in holding at bay both the large imperial army and several French armies much better organized and officered than his own. On the 1st of August, 1759, he gained a brilliant victory over Marshal Contades at Minden. In 1766 an estrangement occurred between Ferdinand and Frederick the Great, in consequence of which he retired from the military profession, and passed the remainder of his life at his castle of Veschelde where he occupied himself in building and other improvements, and became a patron of learning and art, and a great benefactor of the poor. He died 3d July, 1792.

See Knesebeck, *Ferdinand Herzog von Braunschweig und Lüneburg, während des Siebenjährigen Kriegs*, 2 vols., Hanover, 1857–58; Von Westphalen, *Geschichte der Feldzüge des Herzogs Ferdinands von Braunschweig-Lüneburg*, 5 vols., Berlin, 1859–72; and Carlyle's *History of Frederick the Great*.

FERENTINO, the ancient *Ferentinum*, a town of central Italy, in the province of Rome, is situated on the Neapolitan railway about 45 miles S. E. of Rome. It lies on the side of a hill rising immediately to the left of the Via Latina. It possesses mineral springs, a cathedral, and some interesting remains of the ancient Ferentinum. These consist chiefly of the old walls built somewhat in the cyclopean style, a kind of citadel on the top of the hill, on which the cathedral now stands, and various other portions of old Roman buildings containing numerous inscriptions. The ancient Ferentinum at one time belonged to the Volsci, but soon after the defeat of that people by the Romans in 413 B.C. it was made over with the adjoining territory to the Hernici. It was taken by the Romans in 361 B.C., but so leniently dealt with that, when the Hernici rebelled for the third and last time, Ferentinum was one of the three Hernician cities that refused to join the revolt. In consideration of this the inhabitants were allowed to retain their own laws, which they preferred to the Roman code; but after the social war they accepted the franchise. The population in 1871 was 8360.

FERENTO, the remains of a city of Etruria whose ancient name was *Ferentinum*. They are situated on the northern slope of the Ciminian hills, about five miles from Viterbo, and the same distance from the banks of the Tiber. The ancient city was the birthplace of the emperor Otho, and possessed a very old and splendid temple of Fortune. In the 11th century the city was destroyed by the inhabitants of Viterbo, and it is now uninhabited. Various portions of its walls and gates are still extant, but the principal building of which the remains still exist is a theatre of very peculiar construction.

FERGHANA, now a province of Russian Turkestan, is the valley containing the head-waters of the Sír Darya or Jaxartes (one of the two great feeders of Lake Aral), and lies among the western ranges of the Thian Shan mountains, which enclose it on every side except at its west extremity, where the river emerges, passing Khojend, into the plains of western Turkestan. It is of oval form, and extends approximately from 70° to 74° E. long., and from a little below 40° to 42° N. lat., having on the N. the mountains which separate it from the valleys of the Chirchik and the Talas, and on the S. the comparatively unbroken chain which divides it from the mountain state of Karategin, and farther east from the long highland strath or steppe of the Alai.

There is only one road into Ferghana practicable for wheeled vehicles, viz., that from Khojend. The road from Bokhara to Kashgar enters the valley at the same place, and, passing along its entire length, crosses the southern border range by the Terek pass. This road, which passes through the chief towns of the province, was before our era perhaps the most important route of the active trade between China and the West, and has ever since been much frequented for general purposes. The direct road from Bokhara to Kuldja also runs through Ferghana, but the longer and easier route by Tashkend is usually preferred. Roads to Badakhshán and the south cross the Alai range by passes 12,000 to 14,000 feet high.

---

[1] Crowe, *History of France*, iv. 151.

The Sír Darya rises in the south-east corner of the valley, but only takes that name after joining the Naryn, a much longer and more considerable stream, having first given off several large canals for irrigation. Its affluents from the north are few and unimportant; about one-third of the valley lies to the north of the Sír, where, except in the rich districts round and to the east of Namanghán, the land is usually poor, hilly, and ill-watered. On the south, however, along the foot of the hills, a rich belt of cultivation 10 to 27 miles wide extends with few interruptions for about 160 miles. For luxuriant beauty this region is unequalled in Central Asia, and its wealth, being the combined result of climate, soil, and abundant water, might be developed indefinitely. The banks of the Sír (like those of the Naryn) are almost everywhere sandy and sterile, for its waters are scarcely used for irrigation except near its source, and countless streams flowing from the southern mountains are absorbed by irrigation before reaching it. These mountains fall gradually towards the valley (whose greatest width is about 65 miles) in a succession of minor parallel ranges, inclosing terraces or valleys, each usually with its village, and cultivated up to over 4000 feet. These valleys are of easy slope; the transverse valleys through which the streams force their way to the plain are shorter, steeper, and less capable of cultivation. Rich alpine pastures occur at the heads of the valleys; the barren tracts in the plain are used for winter grazing.

Agricultural Produce, etc.—All the products of the valley (which is 1200 to 1500 feet above sea-level) are cultivated up to 3000 or 4000 feet. Grapes, indeed, ripen at 5800 feet, and barley at 8500. Produce is classed for taxation under three heads—field produce, garden produce, and fruit-trees. Among the first are wheat, barley, rice, pulses, maize, sorghum, and millet; among the second, melons, water melons, pumpkins, pease and beans, onions, garlic, carrots, red-pepper, madder and other dye-plants, cotton, tobacco, flax, and oil-seeds. Among the fruits are excellent grapes, apples, pears, plums, peaches, almonds, mulberries, figs, and pomegranates.

Climate.—The climate generally is healthier and more equable than that of Russian Turkestan. The winters are milder, and in summer, though the heat is oppressive, the nights are cool. Little rain falls except in the mountains. The sky is sometimes darkened by a dry mist of fine dust, to which, in great measure, Richthofen attributes in other parts of Asia the formation of vast deposits of loess (see vol. v. p. 550).

Towns.—The principal towns, which nearly all lie in the fertile belt above described, are—Khokand, the late capital of the khanate, with a population of 50,000 to 70,000; Namanghán, the only important place north of the Sír Darya, 20,000; Andiján, the capital in Baber's time, 20,000; and Marghilán, the chief seat of the silk manufacture, 30,000. Ush, with Usgand, Gulsha, and other smaller places in the hill district to the south-east, is frequented by the Kirghiz, who cultivate their barley and wheat in the neighborhood. Usgand appears, from its architectural remains of the 12th century, to have been a place of considerable extent. Kassan, in the north, is a very ancient Tajik town.

Population.—The population of Ferghana, which for Central Asia is a thickly-peopled region, is about 900,000, of which perhaps two-thirds are settled and the remainder nomad. The settled population consists chiefly of Tajiks and Uzbegs; the former, the early Aryan inhabitants, are found in greatest purity in the lower mountain valleys; those in the chief towns and central districts, who are known as Sarts, show a large infusion of Uzbeg and other Turki blood. The Uzbegs, who predominate in numbers, are here much more modified by the Tajik element than they are in Bokhara. Being the dominant race, their name is assumed by the various other Turk and Tatar elements, which in successive waves have swept over or occupied this region for more than 2000 years. There are also settlements of Kashgaris, who have fled from Chinese oppression. The nomads are mainly Kipchaks and Kara Kirghiz or Buruts; the former, the braver and more capable race, is indeed only half nomadic, occupying chiefly the northern and eastern districts of the valley. The others have their summer quarters in the surrounding mountains and high plateaus, chiefly in the Alai and Pamir, and winter in the valley, where they eke out a livelihood by cultivating patches of barley, wheat, and lucerne, thus becoming amenable to taxation and control. They are poorer than the settled population, who are usually well-to-do. The townspeople especially are fond of good living and sociable, and being, like the Sarts everywhere, keen traders, drive good bargains with the simpler nomads. They are Sunni Mahometans; their language the classic Chaghatai Turkish, slightly influenced, M. Vambéry says, by the harsher dialect of the tribes to the north-east.

History.—Ferghana was not protected by its mountain barriers from the vicissitudes which befell its neighbors. Overrun by the Arabs in 719, and subject to the Samanides in the 9th and 10th centuries, it formed part, successively, of the conquests of the Kara Kitai, of Jenghiz Khan, and of Timur, whose descendant Baber was expelled in 1513 by the Uzbegs. After a long period of disintegration the khanate was reconsolidated about 1770 by Narbuta Bai, a reputed descendant of Baber, and until 1853, when the last series of Russian aggressions began, the dominions of his successors, the khans of Khokand, extended far beyond the valley of Ferghana to the north and northwest. Their influence, everywhere considerable, was most actively exerted in Kashgar, probably from commercial reasons, the Chinese allowing them to maintain agents there to supervise the Khokandi traders and collect dues. The encroachments of Russia were made easier by the continual jealousy between Khokand and Bokhara, and by dissensions between the nomad and settled populations. The late ruler, Khudayar Khan, though more than once driven out by his oppressed subjects, always kept on good terms with the advancing Russians, who in 1874 sent a mission to Khokand. They found Khudayar setting out to suppress a Kirghiz rising, and, as the disturbances increased, persuaded him to retire with them and to place his country at the disposal of the czar. They then ostensibly adopted his son Nasr-ed-din, appropriating, at the same time, all the country north of the Sír. Their conduct, however, soon fanned the existing irritation into a religious war against the Russians, whose position for a time was critical, and the movement was only crushed, and the province annexed, after great destruction of life and property.

Trade.—There are no trustworthy statistics of the trade of Ferghana. Russian produce is probably imported to the value of 2,600,000 rubles (about £370,000), chiefly cotton, woollen, and leather manufactures, yarn, and hardware.

Most of the tea comes ostensibly from Russia; but a great deal of Indian tea is smuggled in. The chief exports are silk and cotton. Raw silk, value about Rs.637,000,[1] raw cotton, Rs.930,000, and cotton manufactures and yarn, Rs.330,000, go to Tashkend, the principal mart of Russian Turkestan. Among minor exports are timber, flax, wool, salt, and fruits fresh and dried. There is also a good deal of trade with Bokhara and with Kashgar. Manufactures are little developed: coarse cotton stuffs are made in large quantities for home use and export; also some woollens, hardware, and pottery of a certain merit. There are paper-mills at Khokand and at Charku, which supply nearly all Central Asia; the manufacture resembles the Chinese, one of the few remaining traces of a former extensive intercourse. Gun factories of a rude order exist at Khokand and Andiján.

There is considerable mineral wealth. Naphtha, rock-salt, and gypsum are extensively worked; iron-ore, argentiferous lead, coal, and sulphur have been found, and gold in the headstreams of the Sír.

Revenue.—The revenue (under the late system, which the Russians have in the main adopted) has been about £360,000,[2]—the chief items being the *kharáj*, or land tax, paid in grain, £202,000; the *tanapna*, on garden produce and fruit trees, £67,000; and the *zakát* (one-fortieth part), on the cattle of the nomads, on exports and imports, on trade licenses, etc.

Administration.—The Russians have divided Ferghana into seven districts, viz., Khokand, Marghilán, Andiján, Ush, Uchmián or Wadil, Namanghán, and Chust. The administrative centre is removed from Khokand to Marghilán, as the nomads are more easily controlled from that quarter. Justice is administered in civil cases by the *shariat*, or Mahometan code, a Russian procureur being present; in criminal cases by the Russian code. The affairs of the nomads are managed by their own elders, who are obliged to adopt any new regulations imposed by the Government.

---

[1] The total production is estimated by Petrofski, agent to the Russian ministry of finance, at 10,000 to 15,000 puds of 36℔ each, value 2 to 3 millions of rubles.

[2] It was estimated in 1877 at £272,000, showing that the country had not then recovered from the effects of the war of annexation.

Ferghana is mentioned by Chinese writers of the Han dynasty (from 200 B. C.); by Hiouen-thsang, the Buddhist pilgrim, in the 7th century; by various Arab writers between the 10th and 13th (see D'Herbelot and the *Oriental Geography*); in the accounts of the wars of Timur in the 14th century (see Deguignes's *Histoire des Huns*, etc.), of his son Shah-rukh's mission to China (1419), and of the Chinese mission to him; in the emperor Baber's Memoirs and Mirza Haidar's *Tarikhi-Rashidi* in the 16th century (see Dr. Bellew's "History of Kashgar" in Forsyth's *Report of the Mission to Yarkand*); in the great *Chinese Geography* of the 18th century, translated by Klaproth (*Magasin Asiatique*). See also *Notices of the Mediæval Geography and History of Central and Western Asia*, by E. Bretschneider, M. D.

Modern authorities are—Schuyler's *Turkestan;* Fedchenko's *Travels in Turkestan* (Russian), 1875; Terentief, *Russia and England contending for the Markets of Central Asia* (Russian), 1876; *History of Khokand*, by Sodhi Hukm Singh of the Punjab Secretariat, edited by Major C. E. Bates: "Journey to the W. Portion of the Thian Shan Range, etc., by N. Severtsof, translated by R. Michell, *R. G. S. Journal*, 1870; communications of Ujfalvy in *Bul. de la Soc. Géog. de Paris*, 1877–78; "Das Gebiet Ferghana, das frühere Chanat Chokand," from the *Russische Revue*, by A. Kuhn. (C. T.)

FERGUSON, Adam (1723–1816), a distinguished philosopher and historian, was born, June 20, 1723, at Logierait, Perthshire, of which parish his father was minister. He received the rudiments of his education at the village school of his native parish, after which he was removed to Perth grammar-school, where he made remarkable progress in classical literature. Toward the end of 1738 he entered the university of St. Andrews, where he took the degree of M.A. on 4th May, 1742. In November of the same year he entered the divinity hall, and in 1745, although he had studied divinity only one half of the usual period, he was allowed by the General Assembly to be ordained by the presbytery of Dunkeld, on the representation that he had been selected as the fittest person, from his knowledge of the Gaelic language, to fill the office of chaplain to the 42d regiment, under the command of Lord John Murray. When this regiment was at the battle of Fontenoy, Ferguson went into action at the head of the attacking column with a drawn broadsword in his hand, and could with difficulty be persuaded to retire to the rear. He continued attached to the regiment till 1754, after which he resolved to devote himself to literary pursuits. About the beginning of 1757, on the resignation of David Hume, he was elected librarian and clerk to the Faculty of Advocates, but these offices he relinquished in about a year on becoming tutor to Lord Bute. In 1757 he rendered himself conspicuous by the interest he took in the success of the tragedy of *Douglas*, written by his friend Home; and by a pamphlet, *The Morality of Stage Plays seriously considered*, which he published in its defence.

In 1759 Ferguson succeeded Dr. John Stewart as professor of natural philosophy in the university of Edinburgh. In 1764 he was transferred to the chair of moral philosophy, and within little more than a year after he published his *Essay on the History of Civil Society*, which was received with much approbation, and was translated into several European languages. Soon afterwards he began to collect materials for a history of the Roman commonwealth. Whilst thus engaged, he was solicited by the guardians of Charles, earl of Chesterfield, to superintend that young nobleman's education, which had been much neglected. He joined his young charge at Geneva in May, 1774, and remained with him for about a year. In his absence he had very nearly been deprived of his office in the university, the town-council having, as patrons, proposed to declare the chair vacant. In 1776 Ferguson published a pamphlet on the American revolution in opposition to Dr. Price's "Observations on the nature of civil liberty," in which he sympathized with the views of the British legislature. When the Government resolved to send out commissioners to quiet the disorders in the colonies, he was appointed secretary. They failed to accomplish the object of their mission, but the Government obtained through them fuller information regarding the state and temper of the Americans than they had previously possessed.

In 1780 Ferguson had a paralytic attack, which was one of the most remarkable on record, for, by an abstemious diet, he continued to enjoy almost uninterrupted good health for more than thirty years, while his mental powers were not impaired. In 1783 his great work, the *History of the Progress and Termination of the Roman Republic*, appeared in 3 vols. 4to; it was very popular, and went through several editions. In it Ferguson gives, in a connected and elegant form, a narration of the great facts of Roman history for a period of five hundred years. He was led to undertake this work from a conviction that the history of that remarkable people during the period of their greatness was a practical illustration of those ethical and political doctrines which were the object of his peculiar study.

No longer able to undergo the fatigue of public teaching, Ferguson in 1785 resigned his chair in the university, in which he was succeeded by Dugald Stewart, then professor of mathematics. He now proceeded to revise his academic lectures, and in 1792 they were published under the title of *Principles of Moral and Political Science.*

In his ethical system Ferguson treats man throughout as a social being, and illustrates his doctrines by political examples. As a believer in the progression of the human race, he placed the principle of moral approbation in the attainment of perfection. His speculations have been carefully criticised by Cousin, who thus expresses himself with reference to this theory:—"We find in his method the wisdom and circumspection of the Scottish school, with something more masculine and decisive in the results. The principle of *perfection* is a new one, at once more rational and comprehensive than benevolence and sympathy, which in our view places Ferguson as a moralist above all his predecessors." By this principle Ferguson endeavors to reconcile all moral systems. With Hobbes and Hume he admits the power of self-interest or utility, and makes it enter into morals as the law of self-preservation. Hutcheson's theory of universal benevolence and Smith's idea of sympathy he combines under the law of society. But, as these laws are the means rather than the end of human destiny, they are subordinate to a supreme end, and this supreme end is perfection. In the political part of his system Ferguson follows Montesquieu, and pleads the cause of well-regulated liberty and free government.

When in his seventieth year, Ferguson, intending to prepare a new edition of his Roman history, resolved to visit Italy. He visited some of the principal cities of Europe, and passed part of the winter of 1793 at Rome. He was generally well received, and was elected a member of the Academy of Sciences of Berlin, of the Etruscan Society of Antiquaries at Cortona, and of the Arcadia at Rome. From 1795 he resided successively at the old castle of Neidpath near Peebles, at Hallyards on Manor water, and at St. Andrews, where he died February 22, 1816.

Besides the works above mentioned, Ferguson is the author of *Analysis of Pneumatics and Moral Philosophy*, Edinburgh, 1766; *Institutes of Moral Philosophy*, 1769, 1773, 1785, translated and used as a text-book in several foreign universities; and a few minor publications. See a biographical sketch by J. Small, in *Trans. of the Royal Society of Edinburgh*, vol. xxiii.

FERGUSON, James (1710–1776), an eminent mechanist and astronomer, was born near Keith in Banffshire in 1710, of parents in very humble circumstances. He first learned to read by overhearing his father teach his elder brother, and with the help of an old woman was "able," he says in his autobiography, "to read tolerably well before his father thought of teaching him." After receiving further instruction in reading from his father, who also taught him to write, he was sent for three months to the grammar-school at Keith. His taste for mechanics was about this time accidentally awakened on seeing his father making use of a lever to raise a part of the roof of his house—an exhibition of seeming strength which at first "excited his terror as well as wonder." On discovering how the seeming wonder was effected, he began experiments with the view of improving on the simple lever his father had made use of; and although he soon learned that all his inventions had been anticipated, he was so well pleased to find his principles confirmed that his passion for the study of mechanics was increased rather than diminished. As soon as his age permitted he was sent to a neighboring farm to keep sheep, where in the day time he amused himself by making models of mills and other machines, and at night in studying the stars. Afterwards, as a servant with a miller, and then with a doctor, he met with hardships which rendered his constitution feeble through life. Being compelled by his weak health to return home, he there amused himself with making a wooden clock. When slightly recovered he showed this and some other inventions to a neighboring gentleman, who engaged him to clean his clocks, and also desired him to make his house his home.

He there, at the suggestion of a lady visitor, commenced to draw patterns for needle work, and his success in this art led him to think of becoming a painter. Through the assistance of the same lady he was at length sent to Edinburgh, where, having obtained some instruction in drawing, he began to take portraits in miniature, by which means, while engaged in his scientific studies, he supported himself and his family for many years. On account of the success of his *Astronomical Rotula*, he determined, in 1743, to leave Edinburgh for London, where he published some curious astronomical tables and calculations, and afterwards gave public lectures on experimental philosophy. These he repeated in most of the principal towns in England. His deep interest in his subject, his clear explanations, his ingeniously constructed diagrams, and his mechanical apparatus rendered him one of the most successful of popular lecturers on scientific subjects. It is, however, as the inventor and improver of astronomical and other scientific apparatus, and as a striking instance of self-education, that he claims a place among the most remarkable men of science of his country. His manners were unaffected and courteous, and his life simple, studious, and irreproachable. In 1763 he was elected a fellow of the Royal Society, and in 1770 a member of the American Philosophical Society. During the latter years of his life he was in receipt of a pension of £50 from the privy purse. He died in London 17th November, 1776.

Ferguson's principal publications are *Astronomical Tables*, 1763; *Lectures on Select Subjects* (1st ed. 1761, edited by Sir David Brewster in 1805); *Astronomy explained upon Sir Isaac Newton's Principles* (1756, edited by Sir David Brewster in 1811): and *Select Mechanical Exercises, with a Short Account of the Life of the Author, written by himself* (1773). This autobiography is included in an *Extended Life* by E. Henderson, LL.D. (1st ed. 1867, 2d 1870), which also contains a full description of Ferguson's principal inventions, accompanied with illustrations. See also *The Story of the Peasant-Boy Philosopher*, by Henry Mayhew (1857).

FERGUSSON, Robert (1750–1774), one of the minor poets of Scotland, owes his chief fame to the fact that he was, in a very special sense, the precursor of Burns. He was the youngest of three sons of William Fergusson, a man of superior intelligence, who removed from Aberdeen to Edinburgh in 1746, and there ultimately found employment with the British Linen Company as accountant. Robert was born 17th October, 1750, and grew up a delicate youth, with a nervous susceptibility which increased with years, and unfitted him for the prosaic duties of daily life. His health did not admit of his being sent to school till his sixth year; but both there and at the university of St. Andrews he manifested great quickness, though accompanied by an impulsive fickleness not unfrequently characteristic of the poetical temperament. Among his fellow students he was distinguished for his vivacity and humor. His conversation was singularly fascinating, his powers of mimicry were great, and he sang Scottish songs with fine effect. In one of his frolics he undertook for a wager to play the part of a ballad singer; and, in suitable disguise, furnished with a large bundle of ballads, he disposed of the whole, while he attracted the crowd by his spirited rendering of popular songs. Hence, both at college and in subsequent years, his company was sought after; and in an age when the convivial habits of society were under little restraint, he was exposed to temptations in all respects prejudicial to him. His father died while he was still at college; but a bursary which he held enabled him to complete his four years of study. The loss of his father was nevertheless an irreparable one at the most critical stage of life. His studies appear to have been subsequently pursued in a desultory fashion. He abandoned all thought of the clerical profession for which he had been preparing, and returned to his widowed mother without any definite plan or prospect for life. While still at college he had made more than one attempt at dramatic composition, and wrote two acts of a tragedy, of which the hero of Scottish romance, Sir William Wallace, was the central figure. But in the desultory efforts of his erratic muse there is no indication of dramatic power. The sprightly gayety which made him so covetable a companion inspired his best poems, which are more noticeable for their graphic humor than for tenderness or depth of feeling.

After a brief sojourn with a maternal uncle at Aberdeen, Fergusson returned to Edinburgh, and ere long obtained employment as copying clerk in a lawyer's office. In this humble occupation he passed the remainder of his brief life, relieving the irksome drudgery by poetical composition, and by evenings passed in the convivial gatherings which then formed a peculiar feature of the social life of Edinburgh. He was a member of one of its most noted clubs, celebrated by him in his poem of *Auld Reekie*. "The Knights of the Cape," as they dubbed themselves, were wont to assemble at a tavern in Craig's Close in the vicinity of the Cross; each member had a name and character assigned to him, which he was required to maintain at all gatherings of the order. David Herd, the editor of what Scott styled the first classic edition of Scottish song, was sovereign of the Cape when Fergusson was dubbed a knight of the order, with the title of *Sir Precentor* in allusion to his fine voice. Alexander Runciman, the historical painter, his pupil Jacob More, and Sir Henry Raeburn were all members. The old minute books of the club abound with pencilled sketches by them, one of the most interesting of which, ascribed to Runciman's pencil, is a sketch of Fergusson in his character of *Sir Precentor*.

In the case of Fergusson, as in that of Burns, critical censors have been too apt to ascribe to them excesses of a wholly exceptional nature; whereas they only conformed to the habits of society at a time when clergymen, judges, and men of all ranks habitually frequented the tavern, and sought intellectual as well as social pleasures in convivial clubs. In such assemblies Fergusson appears to have been the life of the company. In a letter addressed to Burns, Mr. Peter Stuart, then editor of the *Morning Post*, refers to Fergusson as his "inestimable friend," and bears testimony to the fascinating social attractions of his society. "There was," he says, "such a richness of conversation, such a plenitude of fancy. . . . His manner was so felicitous, that he enraptured every person around him, and infused into the hearts of the young and old the spirit and animation which operated on his own mind." In person he is described as of a slender, handsome figure, his forehead high, his countenance open and pleasing, though somewhat effeminate, and characterized by extreme pallor, but kindled into life by the animation of his large black eyes, whenever he became interested in the conversation. His light brown hair was worn unpowdered, with long waving curls on each side of the head, and tied into a queue behind with a black silk riband.

From time to time Fergusson contributed to Ruddiman's *Weekly Magazine* grave and humorous pieces, both in English and in the Scottish dialect; but in 1773, when he was in his twenty-fourth year, his poems were collected and published in a volume. The event is not without its significance in English literature. Robert Burns was then in his fifteenth year. The volume ere long came under his notice, and the generous poet made no stinted acknowledgment of all that he owed to his predecessor. But ere such appreciative recognition could be rendered, its unhappy author had died in a maniac's cell. A fall, by which his head was severely injured, greatly aggravated symptoms of mental aberration, from which he had seemed to be recovering; and after about two months' confinement in the old Darien House,—then the only public asylum in Edinburgh,—the poet died on the 16th October, 1774, within one day of completing his twenty-fourth year.

The influence of Fergusson's writings on the Ayrshire poet is undoubted. He is thus apostrophized by Burns:—

> "Oh, thou my elder brother in misfortune,
> By far my elder brother in the muses,
> With tears I pity thy unhappy fate!"

His *Leith Races* unquestionably supplied the model for the *Holy Fair*. Not only is the stanza the same, but the Mirth who plays the part of conductor to Fergusson, and the Fun who renders a like service to Burns, are manifestly conceived on the same model, and even in part in the same terms. *The mutual complaint of Plainstanes and Causey* probably suggested *The Brigs of Ayr*; *On seeing a Butterfly in the Street* has reflections in it which strikingly correspond with *To a Mouse*, one of the most exquisite of all Burns's minor poems; nor will a comparison of *The Farmer's Ingle* of the elder poet with *The Cottar's Saturday Night* admit of doubt as to the influence of the city-bred poet's muse on that exquisite picturing of homely peasant life. But the Ayrshire poet was himself the first to render a generous tribute to the merits of Fergusson. On his visit to Edinburgh in 1787 he sought out, not without difficulty, the nameless grave mound of the poet, and forthwith petitioned the authorities of the Canongate burying ground for permission to erect the memorial stone which still enables the visitor to identify the poet's grave. The inscription on the stone is as follows:—

> "Here lies Robert Fergusson, Poet.
> Born September 5th, 1751—Died 16th October, 1774.
> No sculptured marble here, nor pompous lay,
> 'No storied urn, nor animated bust;'
> This simple stone directs pale Scotia's way
> To pour her sorrows o'er her poet's dust."

On the reverse of the stone is this record of its origin:—"By special grant of the managers to Robert Burns, who erected this stone, this burial-place is to remain for ever sacred to the memory of Robert Fergusson." The simple stone has since been rescued from decay, and inserted in a monumental structure of a more ornate character. The date assigned as that of his birth differs, as will be seen, from the one given above, which rests on the authority of his younger sister, Margaret, the wife of Mr. Alexander Duval, purser in the royal navy. According to her statement, the birthday of the poet's elder sister Barbara had been assigned by mistake to him.

The first edition of Fergusson's poems was published by Ruddiman, at Edinburgh, in 1773, and a supplement, containing additional poems, in 1779. A second edition appeared in 1785, and another in 1807, with a biographical sketch by Alexander Peterkin. A life of Fergusson is included in Dr. David Irving's *Lives of the Scottish Poets;* and the chief points in various biographical sketches are embodied in Dr. Robert Chambers's article in his *Lives of Illustrious and Distinguished Scotsmen.* (D. W.)

FERGUSSON, SIR WILLIAM (1808–1877), Baronet, an eminent surgeon, the son of James Fergusson of Lochmaben, Dumfriesshire, was born at Prestonpans, East Lothian, 20th March, 1808. After receiving his early education at Lochmaben and the High School of Edinburgh, he entered the university of Edinburgh with the view of studying law, but soon afterwards abandoned his intention, and became a pupil of Robert Knox the celebrated anatomist. At the age of twenty he became a licentiate of the College of Surgeons, and he was elected a fellow in the following year. The ingenious fittings of a dissecting case which he had constructed by his own mechanical skill having attracted the attention of Knox, the latter engaged him as his demonstrator. While occupied in teaching anatomy he devoted his chief attention, under the direction of Knox, to the improvement of his surgical skill. In 1831 he became an extramural lecturer on surgery, and in 1836 he succeeded Liston as surgeon to the Royal Infirmary. In 1840 he was appointed professor of surgery in King's College, London, and surgeon to King's College Hospital. At first he acquired a practice in London only slowly, but after the deaths of the two Coopers and of Liston he soon held an unrivalled position in his own department. In 1849 he was appointed surgeon-in-ordinary to the Prince Consort, in 1855 surgeon-extraordinary to the Queen, and in 1860 sergeant-surgeon to the Queen. He was a fellow of the Royal Societies of Edinburgh and London, and of various medical societies. In 1865 he was created a baronet. He died at his Scottish residence in Peeblesshire, February 10, 1877. As a surgeon Fergusson's greatest merit is that of having introduced the practice of "conservative surgery," in many cases of diseased joints which before his time were treated by amputation. He made his diagnosis with almost intuitive certainty; and as an operator he was characterized by self-possession in the most critical circumstances, minute attention to details, and great refinement of touch, and relied more on his mechanical dexterity than on complicated instruments. Sir William Fergusson is the author of *The Progress of Anatomy and Surgery in the Nineteenth Century* (1867), and of a work on *Practical Surgery* (1st ed. 1842) which has a high reputation as a text-book.

FERID-EDDIN-ATHAR (1119–1229), or **FARID UDDIN ATTAR**, a Persian poet and mystic, was born at Kedken, near Nishapur, 513 A.H. (1119 A.D.), and was put to death 627 A.H. (1229 A.D.), thus having reached the age of 110 years. His real name was Muhammed ben Ibrahim, and Ferid Eddin was simply an honorable title equivalent to Pearl of Religion. He followed for a time his father's profession of druggist or perfumer, and hence the name of Athar or Attar, which he afterwards employed as his poetical designation. According to the account of Doulat Shah, his interest in the great mystery of the higher life of man was awakened in the following way. One day a wondering fakir gazed sadly into his shop, and, when ordered to be gone, replied: "It is nothing for me to go; but I grieve for thee, O druggist, for how wilt thou be able to think of death, and leave all these goods of thine behind thee?" The word was in season; and Muhammed ben Ibrahim the druggist soon gave up his shop and began to study the mystic theosophy of the Sufis under Sheikh Rekenuddin. So thoroughly did he enter into the spirit of that religion that he was before long recognized as one of its principal representatives. He visited Mecca, and on his return was invested with the Sufi mantle by Sheikh Majduddin of Baghdad. The greater portion of his life was spent in the town of Shadyakh, but he is not unfrequently named Nishapuri, after the city of his boyhood and youth. The story of his death is a strange one. Captured by a soldier of Jenghiz Khan, he was about to be sold for a thousand dirhems, when he advised his captor to keep him, as doubtless a larger offer would yet be made; but when the second bidder said he would give a bag of horse fodder for the old man, he asserted that he was worth no more, and had better be sold. The soldier, irritated at the loss of the first offer, immediately slew him. A noble tomb was erected over his grave at Shadyakh, and the spot acquired a reputation for sanctity. Ferid Eddin was a voluminous writer, and has left no fewer than 120,000 couplets of poetry, though in his later years he carried his asceticism so far as to deny himself the pleasures of poetical composition. His most famous work is the *Mantic Uttuir*, or language of birds, an allegorical poem containing a complete survey of the life and doctrine of the Sufis. It is extremely popular among Mahometans both of the Sunite and Shiite sects, and the manuscript copies are consequently very numerous. The birds, according to the poet, were tired of a republican constitution, and longed for a king. As the lapwing, having guided Solomon through the desert, best knew what a king should be, he was asked whom they should choose. The Simorg in the Caucasus, was his reply. But the way to the Caucasus was long and dangerous, and most of the birds excused themselves from the enterprise. A few, however, set out; but by the time they reached the great king's court, their number was reduced to thirty. The thirty birds (*sî morg*), wing-weary and hunger-stricken, at length gained access to their chosen monarch the Simorg; but only to find that they strangely lost their identity in his presence—that they are he, and he is they. In such strange fashion does the poet image forth the search of the human soul after absorption into the divine.

The text of the *Mantic Uttair* was published by Garcin de Tassy in 1857; a summary of its contents by the same Orientalist appeared in the *Revue Contemporaine*, t. xxiv., and was reprinted as *La poésie philosophique et religieuse chez les Persans*, 1856; and this was succeeded by a complete translation in 1860. Among Ferid-Eddin's other works may be mentioned his *Pend Nameh*, or Book of Reflection, of which a translation by Silvestre de Sacy appeared in *Les mines de l'Orient*, vol. ii.: *Bulbul Nameh*, or Book of the Nightingale; *Wasalet Nameh*, or Book of Conjunctions; *Khusru va Gul*, the King and the Rose; and *Tezkiret al Aulia*. See Sir Gore Ouseley, *Biographical Notices of Persian Poets*, 1846; Von Hammer Purgstall, *Geschichte der schönen Redekünste Persiens*, p. 140; *The Oriental Collections*, vol. ii., 1798; Palmer, *History of Sufiism*.

FERISHTA, MOHAMMED KASIM, a celebrated Persian historian, was born about 1570, at Astrabad, on the shores of the Caspian Sea. While he was still a child his father was summoned away from his native country into Hindustan, where he held high office in the Deccan; and by his influence the young Ferishta received court promotion. In 1589 Ferishta removed to Bejapore, where he spent the remainder of his life under the immediate protection of the Shah Ibrahim Adil II., who engaged him to write a history of India. At the court of this monarch he died about 1611. In the introduction to his work a *résumé* is given of the history of Hindustan prior to the times of the Mahometan conquest, and also of the victorious progress of the Arabs through the East. The first ten books are each occupied with a history of the kings of one of the provinces; the eleventh book gives an account of the Mussulmans of Malabar; the twelfth a history of the Mussulman saints of India; and the conclusion treats of the geography and climate of India. Ferishta is reputed one of the most trustworthy of the Oriental historians, and his work still maintains a high place as an authority. Several portions of it have been translated into English; but the best as well as the most complete translation is that published by General Briggs under the title of *The History of the Rise of the Mahometan Power in India* (London, 1829, 4 vols. 8vo). Several additions have been made by Briggs to the original work of Ferishta, but he has omitted the whole of the twelfth book, and various other passages which had been omitted in the copy from which he translated.

FERMANAGH, an inland county in the province of Ulster, Ireland, extending from 54° 7′ to 54° 40′ N. lat., and from 7° 1′ to 8° 5′ W. long., is bounded on the N.W. by Donegal, on the N.E. by Tyrone, on the E. by Monaghan, and on the S.W. by Cavan and Leitrim. Its greatest length N.W. and S.E. is 45 miles; its greatest breadth N.E. and S.W. is 29 miles. The area extends to 457,369 statute acres, or 714½ square miles, of which 106,530 acres are under tillage, 243,251 in pasture, 5909 in plantations, 55,248 in waste, bog, mountain, etc., and 46,431 under water. The county is divided into eight baronies: viz., Clanawley, Clankelly, Coole, Knockninny, Lurg, Magheraboy, Magherastephana, and Tirkennedy; and these are subdivided into 23 parishes, and 2183 townlands.

The chief town in Fermanagh is Enniskillen, population (1871) 5836. The only other towns of any importance are —Lisnaskea (857), Irvinestown, formerly Lowtherstown (787), Maguire's Bridge (685), Tempo (460), Newtownbutler (418), Brookborough (390), Rosslea (371), Ederney (332), Belleek (327), Derrygonnelly (302), Kesh (296), in all of which fairs are held and post-offices established. The Irish North-western division of the Great Northern Railway passes through the most populous portion of the county, one branch connecting Enniskillen with Clones, another connecting Enniskillen with Londonderry, *via* Omagh, and a third connecting Enniskillen with Bundoran.

Physical Features.—Fermanagh is situated mostly in the basin of the Erne, which divides the county into two nearly equal sections. It presents a hilly, and in many parts a somewhat sterile appearance, though in the main, and especially in the neighborhood of Lough Erne, it is picturesque and attractive. The climate though moist is healthy, and the people generally are tall and robust. The chief mountains are Cuilcagh (partly in Leitrim and Cavan) 2188 feet high, Belmore 1312 feet, Glenkeel 1223, North Shean 1135, Tappahan 1110, Carnmore 1034. Tossett or Toppid and Turaw mountains command extensive prospects, and form striking features in the scenery of the county. But the most distinguishing feature of Fermanagh consists in the great extent of its surface being occupied by the Upper and Lower Loughs Erne, which stretch for 45 miles from S.E. to N.W. These lakes are formed by the expansion of the river Erne, which enters the county from Cavan at Wattle Bridge, and spreads out its waters in the Upper Lough, broken by innumerable islets. Contracting itself again, the river flows in a meandering course to the town of Enniskillen, where it expands itself once more in the Lower Lough, which extends in a N.W. direction for about 20 miles, till the river again issues from it a mile above Belleek. Of the two loughs the lower and larger one is most famed for its picturesque scenery. Both are dotted with many islands, the number of which has been stated as high as 199. The largest islands are Boa (or "*Cow*"), Ennismacsaint, Devenish, Eagle, Innisnakill Gully, Cor, Ferney, Herring, Innismore, and Bellisle. It is navigable throughout, during the winter season, a small steamer plying between Enniskillen and Belleek. The other lakes next in size are Loughs Melvin and Macnean on the border of Leitrim, and draining into the Drowes river. The chief river is the Erne, which, rising in Cavan, passes through Belturbet, Lough Erne, and Belleek on its way to the Atlantic, into which it descends at Ballyshannon. At Belleek it forms a considerable waterfall, well known to sportsmen for its good salmon-fishing. There are several mineral springs in the county, some of them chalybeate, others sulphureous. At Belcoo, near Enniskillen, there is a famous well called Daragh Phadric, held in repute by the peasantry for its cure of paralytic and other diseases; and four miles N.W. of the same town, at a place called "the Daughton," are natural caves of considerable size. The geological formation of the county may be described as consisting mainly of secondary limestone and yellow sandstone. In the former organic remains are plentiful, some fine specimens of encrinites being easily obtainable. A brown marble excavated at Florence Court is beautifully veined, and susceptible of a splendid polish. Gray marble has been found in the parish of Killasher. Iron and coal have also been traced in various places, but only in small quantities. The best iron ore mine is at Belleek.

Industries—Agriculture, etc.—With the exception of the pottery works at Belleek, Fermanagh cannot boast of any distinguishing manufactures. It is chiefly an agricultural county. Of the arable land about the one-half is devoted to pasturage. Oats and potatoes are the crops most extensively cultivated. The next in order are flax, turnips, wheat, barley, rye, beans, and pease. The following table shows the number of acres under the different crops during the years 1874 and 1877:—

	Meadow and Clover.	Oats.	Potatoes.	Flax.	Turnips.	Wheat.	Barley, etc.	Beans and Pease.	Other Green Crops.	Total.
1874	54,566	24,437	16,811	2526	3330	629	183	27	1936	104,345
1877	53,691	25,512	17,285	4183	3844	333	252	92	2131	107,323

The live stock (horses, cows, sheep, etc.) in the county was valued in the census of 1871 at £839,899, but this estimate was on the basis of the values fixed by the census commissioners of 1841, and is therefore much below the actual present worth, which is probably £1,500,000. From statistics prepared specially for Thom's *Almanac* for 1877, it is estimated at £1,354,379. The number of live stock in Fermanagh given in the registrar-general's annual returns during the years 1874 and 1877 is as follows:—

	Horses and Mules.	Asses.	Cows under one year.	Cows one and under two years.	Cows two years and upwards.	Milch cows	Total of Cows.	Sheep.	Pigs.	Goats.	Poultry.
1874	6781	4196	25,556	14,965	15,813	43,548	99,882	13,718	17,304	3818	313,228
1877	7373	4189	23,918	14,708	14,243	43,891	96,760	11,696	26,649	4634	353,452

The county in 1873 was divided among 707 proprietors, of whom 130 owned less than one acre each, or 19 per cent.,—the proportion for all Ulster being 48 per cent. The average extent of each holding was 586 acres, that of Ulster being 239 acres. The total annual rental of the land amounted to £234,634, or 11s. 5½d. per acre—that of Ulster 15s. 8¼d. More than half the whole county was in possession of ten proprietors, namely,—Marquis of Ely, Ely Lodge, 34,879 acres; Earl of Erne, Crom Castle, 31,389; Earl of Enniskillen, Florence Court, 29,635; Sir V. H. Brooke, Bart., Colebrook Park, 27,994; Mervyn Archdall, Castle Archdall, 27,410; John Madden, Roselea Manor, 14,074; J. G. Irvine, Killadeas, 11,388; J. G. Porter's representatives, 11,015; Church Temporalities Commissioners, 10,357; and Hugh de Fellenberg Montgomery, 7996.

Education, etc.—According to the census of 1871, the number of persons in the county over five years of age who could read and write was 41,226; 18,349 could read but could not write, and 22,758 could neither read nor write. There were 10 persons who spoke Irish only, and 349 who spoke both Irish and English. There were two superior schools, having a total of 94 pupils in attendance, all Protestants. On the 31st December, 1876, there were on the rolls of the national schools 16,640 pupils, of whom 9720 were Roman Catholics, 6321 Protestant Episcopalians, 278 Presbyterians, and 321 of other persuasions. At the same date at the Enniskillen model school there were 339 pupils on the rolls, of whom 229 were Protestant Episcopalians, 33 Presbyterians, 18 Roman Catholics, and 59 of other persuasions. In Fermanagh there are neither reformatory nor industrial schools.

Administration, etc.—Fermanagh returns three members to parliament—two for the county, and one for the borough of Enniskillen. The assizes are held at Enniskillen, quarter sessions at Enniskillen and Newtownbutler, and petty sessions at eleven places throughout the county. Fermanagh is within the Belfast military district. The barrack stations are at Enniskillen and Belleek. Ecclesiastically it belongs for the most part to the diocese of Clogher. The county jail and the county infirmary are at Enniskillen; but the district lunatic asylum is at Omagh (in Tyrone), serving for the two counties, Fermanagh and Tyrone. The poor law union workhouses for the county are at Enniskillen, Irvinestown, and Lisnaskea.

Population.—The population of Fermanagh steadily increased up till the year 1841. The famine and subsequent emigration intervening between that year and the next parliamentary census (1851), the population showed a decrease at the latter date of about 25 per cent., and since 1851 the decrease has continued. The exact decrease during the 30 years 1841 to 1871 is 40·69 per cent. In 1841 the population was 156,481; in 1851, 116,047; in 1861, 105,768; in 1871, 92,794; and on the 31st December, 1876, it was estimated at 91,188. From the 1st May, 1851, to 31st December, 1876, the total number of emigrants from Fermanagh was 34,776, or an average of 1337 per annum. In 1871 55 per cent. of the population were returned as Catholics.

History and Antiquities.—According to Ptolemy, the aborigines of this county were the *Erdini*. By the ancient Irish it was called *Feor-magh-Eanagh*, or the "country of the lakes" (lit. "the mountain-valley marsh district"); and also *Magh-uire*, or "the country of the waters." It was divided into two large portions—the one called Targoll, the other Rosgoll. The latter was occupied by the *Guarii*, the ancestors of the MacGuires or Maguires, a name still very common in the district. This tribe or family was so influential that for centuries the county was called after them Maguire's Country, and one of the towns still existing bears their name, Maguire's Bridge. Fermanagh was one of the six counties which reverted to the crown at the time of the flight of the earls of Tyrone and Tyrconnell, and which were included in the well-known scheme of colonization of James I., the Plantation of Ulster. Among the principal Scotch and English settlers at the period of the Plantation were Sir Stephen Butler, Sir Wm. Cole, John Archdall, and Sir Gerard Lowther, from whom some of the towns and villages in the county derived their names, and whose descendants form the leading gentry to the present day. During the revolution of 1688 Fermanagh rendered signal service to the cause of William III. by the gallant stand which its yeomen made against the Irish army, and their descendants possess so much of the military spirit of their forefathers as to make the title "Fermanagh men" still synonymous with bravery and loyalty to the constitution. In the year 1689 battles were fought between William III.'s army and the Irish under Macarthy (for James II.) at Lisnaskea (26th July) and Newtownbutler (30th July). The chief place of interest to the antiquary is Devenish Isle in Lough Erne, about 2½ miles N.W. from Enniskillen. It contains about 80 acres of very fertile pasture land, and has long been celebrated for its romantic situation and ecclesiastical ruins. Near the remains of the abbey of St. Mary, founded in the 6th century by St. Laserian (called also Molaisse or Molush), is one of the best specimens of Ireland's round towers. It is 82 feet high and 49 in circumference, with an ingeniously constructed conical roof. About half a century ago it was carefully repaired, and is now in excellent preservation. Pursuant to "The Irish Church Act, 1869," both the round tower and the abbey have been vested in the secretary of the commissioners of public works in Ireland to be preserved as national monuments. In various places throughout the county may be seen the ruins of several ancient castles, Danish raths, and tumuli, in which last have been found at times urns and stone coffins. At Wattle Bridge, near Newtownbutler, are the remains of a Druidical temple. (W. E. C.)

FERMAT, Pierre de (1601–1665), a famous mathematician, was born at Beaumont-de-Lomagne near Montauban. While still young he, along with Pascal, made some discoveries in regard to the properties of numbers, on which he afterwards built his method of calculating probabilities. He discovered a simpler method of quadrating parabolas than that of Archimedes, and a method of finding the greatest and smallest ordinates of crooked lines analogous to that of the then unknown differential calculus. His method of maxima and minima brought him into conflict with Descartes, but the dispute was due chiefly to a want of explicitness in the statement of Fermat. Fermat was for some time councillor for the parliament of Toulouse, and in the discharge of the duties of that office he was distinguished both for legal knowledge and for strict integrity of conduct. Though the sciences were the principal objects of his private studies, he was also an accomplished general scholar and an excellent linguist. He died at Toulouse in 1665. He left a son, Samuel de Fermat, who was a man of some learning, and published translations of several Greek authors.

The *Opera Mathematica* of Fermat were published at Toulouse, in 2 vols. folio, 1670 and 1679; they have now become very scarce. The first contains the "Arithmetic of Diophantus," with notes and additions. The second includes a "Method for the Quadrature of Parabolas," and a treatise "on Maxima and Minima, on Tangents, and on Centres of Gravity," containing the same solutions of a variety of problems as were afterwards incorporated into the more extensive method of fluxions by Newton and Leibnitz. In the same volume are treatises on "Geometric Loci, or Spherical Tangencies," and on the "Rectification of Curves," besides a restoration of "Apollonius's Plane Loci," together with the author's correspondence addressed to Descartes, Pascal, Roberval, Huygens, and others.

FERMENTATION, a chemical term, which, in accordance with its derivation from *fervere* (to boil), was originally applied indiscriminately to all chemical changes involving the effervescence of a liquid, but which, in its modern acceptation, has in itself nothing at all to do with effervescence, being used to designate a peculiar class of metamorphoses which certain complex organic materials are liable to, and of which the well-known change which grape juice undergoes when it "ferments" into wine, the souring of wine or milk, and the putrefaction of animal or vegetable matter may be cited as familiar examples.

What in all these and similar processes strikes the ordinary observer as something particularly characteristic is their spontaneity: sweet milk turns sour, grape juice passes into wine, wine into vinegar, vinegar into a foul insipid fluid—without the application or addition from without of any agent or reagent; but the "spontaneity" in the eyes of the chemical investigator does not go far. All chemical reactions are spontaneous; and wherever a case occurs of two things acting upon each other, it makes no difference whether one of them be added, say, to the solution of the other from a bottle, or whether it were present in the liquid from the first. What caused chemists to group together fermentative changes as a class of phenomena different from ordinary reactions was the fact that wherever they succeeded in reducing the phenomena to a degree of simplicity sufficient for translating the respective reaction into an equation, this equation, though perfectly correct in the sense of chemical arithmetic, appeared to assert something which ran contrary to the known chemical tendencies of the substances concerned. To explain this by an example, let us take the case of the souring of milk, a fermentation which, when stripped of what, from the purely chemical standpoint, would appear unessential, involves only one reaction, which consists in this, that the milk sugar of the milk, by a mere rearrangement of its ultimate ingredients, passes into lactic acid, according to the equation

$$\underset{\text{Milk Sugar.}}{C_{12}H_{22}O_{11}.H_2O} = \underset{\text{Lactic Acid.}}{4C_3H_6O_3}$$

Now, this in itself is nothing exceptional. A solution of cyanate of ammonia ($NCOH.NH_3$) is no sooner prepared than it passes into one of urea $CO(NH_2)_2$; cyanic acid, ($NCHO$) when left to itself, soon passes into cyamelide, just as the milk sugar of the milk passes into lactic acid. But there is this great difference, that this latter change cannot be realized, under any known set of conditions, in a solution of pure milk sugar in pure water. And so it is in all other analogous cases. But this comes to the same as saying that fermentations, as a class of chemical reactions, are characteristically *non-spontaneous*, and consequently must be caused by reagents, although these reagents have no place in the mere balance-sheet of the reaction. In fact, experience shows that no fermentable chemical species will ferment except in presence of water, and unless it be kept by means of that water in direct contact with some specific "ferment," which, although it contributes nothing to the substance of the products which figure in the equation, nevertheless induces the reaction "by its presence," as the phrase goes. The presence alone, of course, will not do. It is simply inconceivable that a reagent should act chemically unless it were itself in a state of chemical change, although this change may be (and with some ferments probably is) a cycle of changes which always brings back the reagent to its original condition.

Of all the multitude of chemical processes which fall under our heading, vinous fermentation is the one which is by far the best known and most satisfactorily explained; and it is scarcely an exaggeration to say that the present science of the whole subject has been evolved from the study of that particular case. Hence the best course that we can adopt in this article is to begin with a popular exposition of the growth of our knowledge of vinous fermentation, which may familiarize even the general reader with the main points of the whole subject, and then to append a short epitome of the facts concerning the more important of the different fermentative changes..

Vinous fermentation means that peculiar change which all native sacchariferous juices are liable to undergo when left to themselves at the ordinary temperature, and which results in the formation of some kind of "wine." The general course of the phenomena being the same in all cases, we shall assume in what follows that it is grape juice we have to deal with. Such juice, as is well known, when recently prepared, forms an intensely sweet yellowish liquid, which, if it is not so by nature, may be rendered perfectly limpid and transparent by filtration through bibulous paper. Grape juice when left to itself, after having been thus clarified, may remain unchanged for an indefinite time, but when mixed with ever so little of unfiltered juice, it is sure sooner or later to undergo a change, which manifests itself in the appearance of a turbidity in the liquid. This turbidity is owing to two causes, namely, (1) the evolution of carbonic acid, and (2) the formation within the liquid of a finely-divided solid, which through the gas evolution, is partly kept in suspension, partly thrown up to the surface as a scum, and which is known by the name of "yeast." The process, from an almost imperceptible beginning, gradually develops into a more and more vivid effervescence (which not unfrequently assumes the character of a violent ebullition), the yeast at the same time becoming more and more abundant; and when a sufficient quantity of "must" is operated on, the temperature of the fermenting mass soon rises perceptibly beyond that of the surrounding air. Sooner or later of course the reaction reaches a climax, from which onwards it gradually loses in intensity until at last it dies out. The yeast then settles down as a slimy deposit, above which there is left a clear yellow liquid, which, instead of the originally sweet, now has a "vinous" taste, and is endowed with that well-known physiological action characteristic of "fermented liquors." Chemically the change in the nature of the liquid consists substantially in this, that the sugar has mostly or perhaps wholly disappeared, and given place to a corresponding percentage of a volatile inflammable liquid called *alcohol*. To any one who has a real knowledge of these facts it must necessarily suggest itself as a highly probable hypothesis that it is the destroyed sugar which has furnished the ingredients for the formation of the carbonic acid and of the alcohol, while most persons will be inclined to look upon the yeast as a bye product formed from the secondary constituents of the juices.

This view, which is endorsed substantially by our present knowledge of the matter, one is inclined to think should have forced itself even at the earliest times upon the minds of all who reasoned on the process as a material metamorphosis. But although now-a-days everybody looks almost instinctively upon chemical reactions as nothing more than rearrangements of the ultimate ingredients of the bodies concerned, which ingredients in themselves are as a matter of course, assumed to be uncreatable and indestructible, we must not forget that this notion dates back only to the time of Boyle, and that is not much longer than air, and gases generally, have been recognized as species of weighable matter. Hence for many centuries the carbonic acid was not recognized even by chemists as forming a factor in the chemical reaction; it was known only as an effervescence, a phenomenon pure and simple, not as a substance. Van Helmont (born in 1577) was the first to show that the gas which rises from fermenting "must" is different from air, and identical with the *gas sylvestre* formed in the combustion of charcoal and in the calcination of limestone. Long before Van Helmont's time, the "alcohol" had been recognized as a definite kind of matter. The art of concentrating the intoxicating principle of wine by distillation, in fact, was known and practised industrially in the 8th century; and nobody could practise this art without finding out that a spirit can be strengthened by repeated distillations, with elimination of water. But it was only about the 13th century that chemists learned to remove all the water from spirits of wine, and thus to prepare "absolute," that is, pure alcohol.

Ordinary cane sugar and honey were known to the ancients; and chemists from the earliest times took it for granted that these two substances and the sweet principles in fruit juices must be closely related to one another. It is also an old experience that cane sugar or honey when added to grape juice ferments with the sugar originally present in the latter. But the idea that the differences between the several kinds of sugar are owing to the existence of a number of distinct chemical species is comparatively new, and it is only in the course of the present century that the problem of isolating these several species has been satisfactorily solved.

But to return to our proposition; plausible as it is as an hypothesis, to be able to test even its potential correctness, we must know the weights of alcohol and carbonic acid produced in the fermentation of a given weight of sugar, and know also the quantitative elementary compositions of the three substances. Lavoisier was the first to make experiments for supplying these data, which, in fact, could not reasonably have been attempted by anybody before him, as it is he to whom we owe our knowledge of the qualitative elementary composition of the substances concerned, and indeed of organic substances generally.

Before giving his numbers, it may be stated that he regarded acetic acid (a small quantity of which is present in most wines) as, like alcohol and carbonic acid, a constant product of vinous fermentation. According to Lavoisier, 95·9 parts of cane sugar in fermenting yield

Alcohol	57·7
Carbonic acid	35·3
Acetic acid	2·5
	95·5

And according to his elementary analysis of the substances, the proportions by weight are—

	Carbon.	Hydrogen.	Oxygen.
In 35·3 of carbonic acid	9·9	nil	25·4
In 57·7 of alcohol	16·7	9·6	31·4
In 2·5 of acetic acid	0·6	0·2	1·7
	27·2	9·8	58·5
In 95·9 of sugar	26·8	7·7	61·4

From these numbers Lavoisier concluded (and he was quite justified in doing so, considering the imperfections of his methods of analysis) that sugar in fermenting simply breaks up into these three substances, without any access of matter from without. But if he thus managed to arrive at what we now know to be a substantially correct conclusion, this can be credited to him (if at all) only as a happy stroke of divinatory genius, as his numbers are all of them monstrously incorrect, the errors going far beyond what even, with his necessarily imperfect method, could be tolerated as "observational errors." Lavoisier's numbers were subsequently corrected by Gay-Lussac according to his own analyses of sugar, alcohol, and carbonic acid. His results, which have remained unimpugned to the present day, may be stated, with substantial correctness, to have been as follows:—

In vinous fermentation very nearly one-third of the carbon goes off as carbonic acid, while the rest passes into the alcohol; and reducing to 1, 2, and 3 parts of carbon, we have

	Carbon.		Hydrogen.		Oxygen.		Sum.
In carbonic acid.	1	+	nil	+	2·667	=	3·667
In alcohol	2	+	0·5	+	1·333	=	3·833
Sums	3		0.5		4·0	=	7·5
Found in cane sugar...	3		0·458		3·667	=	7·125

The agreement being by no means satisfactory, Gay-Lussac suspected that his analyses of sugar were infected with unobserved errors, and he corrected his figures so as to make them agree with those given above opposite to "Sums." These values, when measured by the customary units (namely C for twelve parts of carbon, H for one part of hydrogen, O for sixteen parts of oxygen), assign to sugar the very simple formula $C_1H_2O_1$ leading to an equally simple equation for the reaction, which is:—

$$6\times(CH_2O) = C_6H_{12}O_6 = 2C_2H_6O + 2CO_2;$$

i. e., 180 of sugar gives 2 × 46 of alcohol + 2 × 44 of carbonic acid;
or 45 " " 23 " + 22. " "

This equation is still looked upon as substantially correct, though not in Gay-Lussac's sense. It is so, if by sugar we understand either of the two kinds of "glucose" which form the bulk of the sweetening principles in fruit juices, and which are composed according to the formula $C_6H_{12}O_6$. Cane sugar, as Dumas and Boullay showed, really has the composition following from Gay-Lussac's analysis, which, as is easily seen, corresponds to the formula $C_{12}H_{22}O_{11} = 2C_6H_{12}O_6 - H_2O$, where H_2O means the elements of 18 parts of water; and these 18 parts of water, as Dumas and Boullay showed, actually are taken up in the fermentation of $C_{12}H_{22}O_{11} = 324$ parts of cane sugar.

Gay-Lussac's equation being, as we said, only substantially correct, we must now state the qualifications implied. Schmidt of Dorpat found in 1847 that vinous fermentation always results in the formation of small quantities of succinic acid. Guerin Vary showed, by quantitative experiments, that in the fermentation of glucose the alcohol and carbonic acid produced account only for about 96·3 per cent. of the glucose. And the present writer happens to know that a certain German apothecary made the interesting discovery that wines, besides the unfermented remnant of glucose that may be left, may contain an unfermentable sweet principle which he recognized as glycerine. These observations, however, were little heeded until Pasteur, in a now classical memoir, proved that glycerine and succinic acid are constant products of normal vinous fermentation, the correct balance-sheet of the reaction, according to him, being as follows:—100 parts of cane sugar, in fermenting, pass into 105·4 parts of glucose, which then break up, yielding (approximately) of

Alcohol	51·1
Carbonic acid	49·4
Succinic acid	0·7
Glycerine	3·2
Matter passing to the yeast	1·0
Sum	105·4

But even this is not quite an exhaustive statement, a small portion of the sugar always passing into the form of higher alcohols ("fusel-oil") and compound ethers.

Vinous fermentation, then, is a far more complex reaction than Gay-Lussac imagined; but it still remains true that all the products formed are derived from the dissociation of the sugar. What is it that brings about this singular decomposition? We call it a singular reaction, because it is one which sugar has never been seen to undergo when subjected by itself or as an aqueous solution to the action of heat or electricity or any ordinary reagent. And we have theoretical grounds for presuming that the reaction is not likely ever to be realized by some "reagent" that has not yet been tried. According to many experiences, an arithmetically possible reaction is the more likely to be realized the greater the heat evolution which, supposing it were realized, it would involve. Now, the reaction formulated in Gay-Lussac's equation $C_6H_{12}O_6 = 2CO_2 + 2C_2H_6O$, as Professor Dewar pointed out some years ago, supposing dry sugar could be made thus to split up, would yield only an insignificant amount of heat, if any. Actual fermentation does involve a liberation of heat, as we know, but the quantity of heat per unit weight of sugar destroyed, according to Dewar's experiments, amounts only to about 83 heat-units, which can be accounted for as being produced by the hydration of the alcohol formed, and, at any rate, is too small to characterize the decomposition of sugar into carbonic acid and alcohol as being at all of itself a probable reaction. Even the somewhat higher result previously arrived at by Dubrunfaut, namely, 135 heat-units per unit of sugar, cannot affect this conclusion. Before going further let us take an exact survey, from the chemical standpoint, of the conditions which are known to favor or impede the actual process.

(1.) Pure solutions of cane sugar or glucose do not ferment under any circumstances.

(2.) Many kinds of impure sugar solutions, such as grape juice, brewers' wort, etc., do ferment. The range of temperatures most favorable to this process lies between about 20° and 24° C. (or 68° and 75° F.). But even grape juice does not ferment at temperatures lying too close to the freezing-point, nor does it ferment at temperatures exceeding a certain limit, which lies at about 60° C. (140° F.). The most lively fermentation comes to a stop when the liquid is boiled, and, after cooling, it takes a longer or shorter time before it resumes.

(3.) Grape juice which has been strengthened by evaporation or addition of sugar from without, does not ferment, when the ratio of water to sugar falls below a certain limit-value.

(4.) Fermentation is impeded and may be entirely stopped by addition of alcohol. Hence the wines produced from the rich juices of southern grapes always contain unfermented sugar.

(5.) Fermentation may be stopped more or less completely by addition to the liquid of even small quantities of certain reagents called antiseptics. Of these corrosive sublimate (and many other heavy metallic salts), sulphuric acid, sulphurous acid, bisulphide of carbon, and carbolic acid may be mentioned as examples.

(6.) Perfectly pure grape juice does not ferment, unless the process has been started by at least temporary contact with ordinary air. This cardinal fact was discovered by Gay-Lussac in a now classical series of experiments. He caused clean grapes to ascend through the mercury of a large barometer into the Torricellian vacuum, where he crushed them by means of the mercurial column. The juice thus produced and preserved remained unchanged; but the addition to it of ever so small an air-bell (as a rule) induced fermentation, which, when once started, was always found to take care of itself.

(7.) Ordinary vinous fermentation always involves the formation of yeast. This is the most important of positive facts made out.

(8.) The rate at which a fermentation progresses is (in a limited sense) determined by the quantity of yeast present within the liquid.

(9.) Spontaneous fermentation of grape juice is always slow in beginning; addition of yeast from without starts it immediately.

From these facts it is legitimate to conclude that it is the yeast or some constituent of the yeast which somehow or other causes the sugar to break up into alcohol, carbonic acid, glycerine, and succinic acid. But what is the rationale of the action? Chemically speaking, it would appear to be vain to attempt an answer without first knowing what yeast is made of in the chemical sense. Unfortunately the present state of our knowledge on this point is very unsatisfactory. All we know is that yeast is a highly complex mixture of chemical substances which may be arranged under the four heads of—(1) fats (forming about 2 per cent. of the whole); (2) cellulose (about 18 per cent.); (3) nitrogenous substances more or less closely allied to white of egg, some of them soluble, some insoluble in water (about 60 per cent.); (4) incombustible salts, which, when the yeast is burned, remain as "ash" (about 7 per cent.). According to Mitscherlich's analysis, yeast-ash consists mainly of phosphoric acid (54 to 59 per cent.), united with potash (28 to 40 per cent.), magnesia (6 to 8 per cent.), and lime (1 to 4 per cent.). That such a complex mixture should act, chemically, as a whole cannot reasonably be assumed; chemists, accordingly, have always been unanimous in thinking that it is some one constituent or set of constituents of the yeast which constitutes the characteristic reagent in vinous fermentation; but none of them has succeeded in isolating that reagent. The only clue in this respect which we have is an important discovery of Mitscherlich's, who showed that an aqueous extract of yeast, although capable of converting cane sugar into glucose, does not induce fermentation in the glucose formed, whence it at once follows that the ferment must be sought for amongst the insoluble portion of the yeast.

Their non-success in isolating the vinous ferment did not prevent chemists from speculating on its mode of action. Berzelius gave it as his opinion (which was adopted by Mitscherlich and others of the leading chemists) that the action was a purely "catalytic" one. What he meant by this is best explained by an example. Peroxide of hydrogen (a compound of the elements of water and oxygen) is perfectly stable at ordinary temperatures. Add to it a mere speck of platinum black (a peculiar form of finely divided platinum), and it at once breaks up into water and oxygen, the platinum which caused the decomposition remaining unchanged. In an exactly similar manner Berzelius thought the yeast acted upon the sugar, and caused it to break up into alchohol and carbonic acid. The merit of the idea was that it apparently reduced the explanation of a seemingly complex to that of an undoubtedly simpler phenomenon. But unfortunately neither Berzelius nor any of his followers succeeded in proving the objective existence of the analogy by experimental evidence. Hence Berzelius's theory really amounted to no more than showing that vinous fermentation and the "catalytic" reactions of inorganic chemistry were both unexplained phenomena.

Something far more worthy of the name of a theory had been offered 200 years before by Stahl. The originator of the phlogiston theory justly divined that vinous fermentation and putrefaction are phenomena of the same order, and, starting from the well-known infectious nature of the latter, explained both as disturbances in the "molecules" of the fermenting body, brought about by a pre-existing molecular motion. "Ein Körper der in der Faulung begriffen ist bringet in einem anderen von der Faulung annoch befreiten sehr leichtlich die Verderbung zu Wege, ja es kann ein solcher, bereits in innerer Bewegung begriffener Körper einen anderen annoch ruhigen, jedoch zu sothaner Bewegung geneigten sehr leicht in eine solche innere Bewegung hineinreissen."

These ideas of Stahl's, at the time of Berzelius's catalytic theory, had long been forgotten, and they remained lost to science until they were revived and brought into a more definite form by Justus Liebig, who, in a powerful and comprehensive memoir on fermentative changes, which he published in 1848, used them as the basis of a new theory of these phenomena, which justly attracted universal attention, as it—or rather the wonderfully lucid memoir which embodied it—exhibited the subject in a clearer light than anything else that had been said or written on it before. With Liebig as with Stahl, all "fermentations" and "putrefactions" are analogous phenomena. Putrefactions are owing mainly to the inherent instability of the albuminoid constituents of the respective substances in presence of water. So unstable are these albuminoids that even an incipient oxidation (see Gay-Lussac's experiment) may suffice to disturb their chemical equilibrium to such an extent as to cause the whole of the atoms of the mass to gradually rearrange themselves into new products of lesser complexity and consequently higher stability. The decomposition when once started, readily propagates itself through the whole mass, aided as it is by the inherent tendency of the molecule to pass into more highly stable forms, just as a stone which rolls down a hill and strikes other stones on its way causes them roll down likewise. This is so clear and plausible as almost to command assent. It is less easy to agree with Liebig when he tries to explain fermentation, when he says, for instance, that the sugar in grape juice, although not naturally gravitating towards a rearrangement as alcohol plus carbonic acid, is nevertheless caused to undergo this change by its immediate contact with the albuminoids of the juice or yeast, which are in a state of atomic commotion; and it is still less easy to see how such an atomic revolution could progress from sugar to sugar, as he says it may. That the nitrogenous matters of the juice, in all ordinary cases of vinous fermentation, assume the form of yeast, is, according to Liebig, a purely accidental phenomenon, and, if yeast is so characteristically powerful as a ferment, it is so only through its consisting largely of exceptionally unstable albuminoid substances.

Liebig's ideas, more perhaps through the brilliancy of his mode of exposition than the force of his arguments, took firm hold of the scientific mind of the time; amongst chemists at least the general impression was, and it prevailed for a considerable time, that Liebig's theory in a satisfactory manner summed up the whole of the empirical knowledge of the subject—although it totally ignored at least one most important feature in the phenomena which had been brought out and firmly established by Schwann and Cagniard-Latour.

In 1680 a Dutch philosopher, Leuwenhoek, fell upon examining yeast under the microscope, and found it to consist of minute globular or ovoid particles. Microscopes in his time were very imperfect or he would have made a great discovery. Schwann and Cagniard-Latour, who (about 1838, and independently of each other) resumed the old Dutchman's inquiry, used the better instruments of their time, and discovered that Leuwenhoek's globules are membranous bags which exhibit all the morphologic characteristics of vegetable cells, and, like these, when brought under the proper conditions, increase and multiply in the biologic sense. Taking this together with the long-known fact that in vinous fermentation the yeast increases as the process progresses, they naturally concluded that yeast is a species of plant, and that it is the life of that plant which somehow or other causes the chemical change. It is the special merit of Schwann to have adduced powerful experimental evidence in favor of this view. In his case the observations on yeast were incidental only to a more comprehensive investigation, the original aim of which had been to solve the great question of spontaneous generation. Processes of putrefaction having long been known to be invariably accompanied by the formation of vibriones and other microscopic organisms endowed with voluntary motion, he prepared infusions of flesh and other putrescible matters in glass flasks, and, after having hermetically closed these, exposed them for a time to the heat of boiling water, so as to destroy every trace of living germs that might be present. The contents, when preserved in that condition for ever so long, showed no sign of putrefaction or of life of any kind. But when exposed to the air they did putrefy, and soon swarmed with living organisms of various kinds. Obviously it was the air which caused this two-fold change. But then the air which had been shut up with the infusions did not act. This, however, might have been owing to an absorption of the oxygen by the juices. Schwann therefore in another set of experiments, allowed the boiled (and consequently germless) infusions to communicate freely with the atmosphere, in such a manner, however, that no particle of air could enter the flasks without having first passed through a red-hot glass tube, and thus been freed from any germs that might float about in it. In this case the air had fair play, in a chemical sense, but yet not only did no life of any kind make its appearance, but even the chemical changes failed to set in. Exactly similar results were obtained by Schwann in experiments with grape-juice, whether previously mixed or not with yeast. Gay-Lussac's famous experiment failed when the air-bell, before being admitted to the juice, had been heated, and thus freed from living germs. In a few of these experiments, it is true, the results were contradictory to the general evidence afforded by the rest of the work. But Schwann had no doubt in his mind about the close analogy between vinous fermentation and putrefaction; and as the putrefaction experiments had all given one and the same answer, he explained these anomalies as having been caused by unobserved slips in the respective experiments, and did not admit them to invalidate his general proposition that both putrefaction and fermentation are inseparably connected with characteristic biologic phenomena; the less so, as his experiments on the action of certain antiseptics had shown that what is an "antiseptic" to a fermentative change is a poison to the organisms characteristic of the case. Thus, for instance, he found that white arsenic[1] and corrosive sublimate, being poisonous to both plants and animals, stop both putrefaction and fermentation; while extract of nux vomica, being destructive of animal but not of vegetable life, prevents putrefaction, but does not interfere with vinous fermentation. The mechanism of the latter process he imagined to consist probably in this, that the "sugar-fungus" (the yeast) lives at the expense of the nitrogenous matters and of the sugar of the juice, and that those of the elements of these substances which the plant does not assimilate are eliminated chiefly as alcohol. This special theory of Schwann's, as the reader is aware, is not quite correct, but it does not affect his general views on the phenomenon, which were fully confirmed by subsequent investigators. Amongst these we may mention Helmholtz, who showed that oxygen evolved by electrolysis from water does not, like air, induce vinous fermentation. The same observer showed that boiled grape-juice, when tied up in a bladder, does not ferment, even when suspended within a tub full of fermenting juice. The evidence afforded by this experiment was considerably strengthened by Mitscherlich, who proved that even a septum of filter paper effectually stops the propagation of the reaction. More striking still is an experiment which was made many years later by H. Hoffmann. He took a test-tube full of sugar-water, and by a plug of cotton wool inserted within it divided the liquid into two parts. To the upper part he added yeast, which, of course, induced fermentation there; but the change did not propagate itself through the cotton wool to the lower portion. The same material had done good service some years before in the hands of Schröder and Dusch, who proved in 1854, by a most extensive series of experiments, that the something in air which enables it to start fermentative changes in boiled infusions of meat or malt, in grape-juice, etc., can be effectually removed by filtration of the air through cotton wool. It is true the "etc." here does not include milk, which they found to turn sour in filtered as well as in ordinary air, but this exception was subsequently explained away by Pasteur, who found that germs immersed in alkaline liquids may survive temperatures considerably higher than 100° C.

---

[1] According to Schutzenberger, who, however, does not quote his authority, arsenious acid does not impede vinous fermentation.

A number of other important researches, which led to substantially similar results, must be passed over here, and may be, because what we have quoted has never been disproved, and is consequently quite sufficient to show that, in the case of vinous fermentation and putrefaction at any rate, those atomic motions, which, according to Liebig, cause the disintegration of the fermenting substances,—if the notion is to be maintained at all,—cannot be admitted to have an existence outside the living bodies of certain organisms characteristic of the respective changes. To any unprejudiced person this would appear to be sound logic; but Liebig did not see it, and for a long time he had the majority of chemists at least on his side. No reasonable person could have denied the irresistible force of the arguments of Schwann and his followers; but these chemists somehow or other managed to ignore the facts, until Pasteur, by means of a most thorough and extensive experimental research (of which the principal portions were published from 1857 to 1861) simply forced the attention of everybody to the physiological side of the subject, and, by absolutely unimpeachable evidence, proved that Schwann's views are substantially correct. Of this investigation it is impossible to speak otherwise than in terms of the highest admiration. Even the purely critical portion of Pasteur's work would be enough to immortalize his name. He did the whole of the work of Schwann and the rest of his predecessors over again, modifying and perfecting the experimental methods, so as to silence any objection or doubt that might possibly be raised, repeating and multiplying his experiments until every proposition was firmly established. But his work was synthetical as well as analytical. Some of his discoveries will be noticed below; suffice it here to mention one of the general results which he arrived at. Vinous fermentation is only one of a number of fermentative changes to which sugar is liable. The same substance sugar, which, when placed under certain conditions, breaks up into alcohol and carbonic acid, under certain other sets of conditions ferments into lactic acid, or through lactic into butyric acid, or into gum plus mannite. This has long been known. What Pasteur showed is that each of these changes is the exclusive function of a certain species (or at least genus) of organism. What the yeast plant is for vinous a certain other organism is for lactic, a third for mannitic, a fourth for butyric fermentation. No two of these species, even if they belong to the same genus, will ever pass into each other. Pasteur arrived at this great generalization by means of his invention of an ingenious method for cultivating pure growths of the several species, so that each of them could be examined separately for its chemical functions. To explain the method, let us suppose we wanted an unmixed growth of the species of yeast-plant called *Saccharomyces cerevisiæ*. The first step of course is to procure a specimen of yeast which, when examined under the microscope, proves a fair approximation to what is wanted. This being done, we place a quantity of brewers' wort in a flask provided with two necks, one long and very narrow and bent like a gas-evolution tube, the other short and wide like the tubulus of a retort. We boil the wort in the flask to kill the germs, and during the boiling close first the tubulus by means of a (germless) glass stopper, then the narrow tube by means of a previously ignited plug of asbestos. We now allow the flask to cool down slowly, and by exposing it for several days to the proper temperature make sure that there is no potential life in our medium. We then, by means of a thin platinum wire, introduce a speck of the yeast through the tubulus, which, of course, is stopped up again without delay. We then place the flask in a chamber kept at the particular temperature which is most favorable to the development of "saccharomyces." The saccharomyces-cells, being in the majority and enjoying a position of advantage, will multiply at a greater rate than the foreign cells, of which many in fact will go to the wall, so that what we ultimately obtain is a closer approximation to pure saccharomyces than the speck of yeast which we used as seed, and which, in general, was already a little better (in all probability) than the bulk of the yeast it came from. Of the relatively pure yeast we now again take a speck and sow it in a fresh supply of germless wort, and so on until the foreign cells can be assumed to be "Darwinized" out of existence. This method of Pasteur's, apart from its scientific value, is of the greatest practical importance; supposing it to be carried out on a large scale—which, in fact, has been done with some measure of success—it will enable the brewer to grow and use pure saccharomyces, and thus to avoid all the many "diseases" which beer, as brewed with ordinary yeast, is liable to.

After Pasteur's researches it became impossible not to admit that those fermentative changes which he investigates are, at least, in a practical sense, physiological and not purely chemical phenomena; but there appears to be no necessity for assuming, as many do, that it is the life of those minute organisms, *qua* life, which directly causes the phenomena. It seems far more rational and philosophic to adopt the view taken by Berthelot and Hoppe-Seyler, who go no further than to admit that those living organisms are the only known sources for the ferments proper, which in themselves are chemical substances pure and simple.

Proceeding now to give a short account of the different fermentative changes, we begin with those that are proved to be functions of purely chemical reagents.

A. *Fermentations proved to be purely chemical reactions.*

These are conveniently arranged according to the respective catalytic agents.

1. *Acids.*—Many organic substances, when boiled with water and a small quantity of sulphuric, muriatic, or other strong mineral acid, undergo hydration and decomposition, or other chemical transmutation, the acid remaining ultimately in its original condition. Thus, under the circumstances named,—

(1.) Cane sugar is "inverted," *i. e.*, converted into dextrose and levulose, thus:

$$C_{12}H_{22}O_{11} + H_2O = C_6H_{12}O_6 + C_6H_{12}O_6.$$

(2.) The same equation applies to the case of milk sugar, one of the products $C_6H_{12}O_6$ in this case being a peculiar substance called "galactose."

(3.) Starch passes into dextrine (a kind of gum) and dextrose, thus:

$$\underset{\text{Starch.}}{C_{24}H_{40}O_{20}} + \underset{\text{Water.}}{3H_2O} = \underset{\text{Dextrine.}}{C_6H_{10}O_5} + \underset{\text{Dextrose.}}{3C_6H_{12}O_6}$$

(4.) Salicine (a bitter principle in willow bark) breaks up into glucose and "saligenine," thus:

$$\underset{\text{Salicine.}}{C_{13}H_{18}O_7} + H_2O = \underset{\text{Glucose.}}{C_6H_{12}O_6} + \underset{\text{Saligenine.}}{C_7H_8O_2}$$

Many other "glucosides" (native substances containing potential glucose) behave in a similar manner. The exact mechanism of these reactions is scarcely understood; pending exact investigations, they may be explained, according to Lyon Playfair, by a tendency of the acid to combine with the elements of one of the products, which tendency, although sufficient to sever these elements from the rest, is defeated ultimately by the stability of the compound formed by their union with one another.

2. *Diastase* is a peculiar substance which is formed in the germination of grain (in malting), and which has the power of converting many times its weight of starch into dextrine and dextrose when made to act on it in the presence of water at about 66° C. Diastase has not yet been isolated in the pure state. In the process referred to it is changed; but it is not known into what.

3. *Emulsine* is a constituent of almonds (both of bitter and sweet), which is known chiefly for its power of decomposing amygdaline (a crystalline substance contained in bitter almonds, and extractable therefrom by alcohol), with formation of bitter-almond oil and glucose, thus:

$$\underset{\text{Amygdaline.}}{C_{20}H_{27}NO_{11}} + 2H_2O = \underset{\text{Glucose.}}{2C_6H_{12}O_6} + \underset{\text{Volatile oil.}}{C_7H_6O.NCH}$$

The oil, as the formula shows, is a (loose) compound of prussic acid, NCH, and benzaldehyde, C_7H_6O. The common idea that bitter almonds contain prussic acid is erroneous; that acid, like the benzaldehyde, is present only potentially, viz., as amygdaline, which, when the almond meal is treated with water, undergoes the above fermentative change. Many other glucosides are decomposed by emulsine, as they are by dilute acids. It may be said, in passing, that the acrid volatile oil contained in table-mustard is not found ready formed in the mustard seed, but is produced from a constituent of the seed by a fermentative action closely analogous to that we have just been explaining.

4. *Soluble Yeast Ferment.*—It has already been stated that an aqueous extract of yeast, though devoid of the power of inducing vinous fermentation, converts cane sugar into dextrose and levulose. The ferment, as Berthelot showed, can be precipitated from the liquid, in an impure state, by addition alcohol.

5. *Pepsine.*—Stomach digestion (in man and animals nearly related to man) consists mainly in this that the gastric juice dissolves the albuminoids of the food, as hydrochlorates of peptones, the only form, it seems, in which they can be assimilated by the system. The juice owes this power to the presence in it of small percentages of two things, namely, of free hydrochloric acid and of "pepsine," both of which are continuously produced by the mucous membrane. Real pepsine has never been seen; but an impure substance, possessing the specific properties of the ferment, can be extracted from the mucous membrane of the stomach by a laborious process which we have no space to describe. Highly dilute hydrochloric acid alone dissolves certain albuminoids, but it does not convert them into peptones; it acquires this property by the addition to it of a small quantity of the preparation named. It is as well to state in passing that the so-called pepsine of the pharmaceutist is only a very poor apology for even the pepsine of the physiological chemist.

6. *Pancreatine.*—What pepsine is to the gastric juice pancreatine is to the secretion of the pancreas gland, whose function it is to digest the starchy and fatty portions of the food. This "pancreatine" seems to include three ferments, namely, a kind of diastase (see above), a ferment similar in its functions to pepsine, and a ferment which has the power of converting fats into fatty acids and glycerine. None of these has been isolated.

7. *Erythrozyme.*—This is a peculiar ferment which Edward Schunck, in 1854, extracted from madder-root, and which was found by him to possess the power of inducing vinous fermentation in solutions of sugar,—a most important discovery, which ought to be further investigated.

Note.—All these ferments, the acids of course excepted, lose their efficacy at temperatures near 100° C. in presence of water. In the dry state they may survive boiling heat.

B. *Fermentations which are known only as Physiological Processes.*

1. *Vinous Fermentation.*—This case having already been considered, we confine ourselves here to a few additions and qualifications. Vinous fermentation, as we see it going on in the brewers' vats and in the wine-producers' casks, is a function of *Saccharomyces*, a genus of fungi, consisting of minute cells, which sometimes are isolated from one another, sometimes grouped together in a variety of forms, but never united into an organized tissue. There is a variety of species, of which *S. cerevisiæ* (the main constituent of ordinary yeast, as produced in the high fermentation of beer) is the most important. It consists of cells of about $\frac{1}{100}$ millimetre diameter. According to Pasteur, saccharomyces thrives best when immersed in grape juice or wort, or similar liquids. It multiplies only by budding, never by sporification. In pure sugar-water it lives, so to say, at its own expense, and gradually becomes exhausted; but on addition of phosphates (yeast-ash works best) and ammonia salt to the sugar, the plant thrives as well almost as in native sugar juices. When saccharomyces is not fully immersed in the liquor, and otherwise constrained to live under abnormal conditions, it passes into "aërobiotic" forms which are similar to mucors and mucedos (mould plants), and which, like these, live on atmospheric oxygen. But these abnormal forms, when re-immersed in wort, etc., always relapse into the non-aërobiotic form of saccharomyces. Real mucedos, etc., for instance *Mycoderma vini* and *cerevisiæ*, which by nature are aërobiotic, when immersed in wort or grape juice, and thus placed in what to them is an abnormal condition, assume non-aërobiotic forms, and produce vinous fermentation, but (contrary to what was formerly assumed by Pasteur himself) they are never converted into saccharomyces, and their fermentative power soon comes to an end, unless they are occasionally revived by re-exposure to the atmosphere.

The power of inducing vinous fermentation, however, is by no means confined to microscopic organisms. It has long been known, from the experiments of Döbereiner and others, that sweet fruit, when kept within an inert atmosphere devoid of free oxygen, evolves carbonic acid with formation of alcohol, and it has been proved by Pasteur that this fermentation, which may extend to a considerable portion of the sugar present, is not accompanied by the development of any microscopic species. Closely related to this fact is the well-established experience that large quantities of sugar may be made to ferment by means of yeast without the latter multiplying to any noteworthy extent. On the other hand, large growths of yeast may be obtained (and as a matter of fact are obtained every day by the makers of German barm) without producing much alcohol. Oskar Brefeld, by means of a peculiar artifice, succeeded in growing saccharomyces in brewers' wort, without producing a trace of alcohol. From these experiences we must conclude that vinous fermentation, far from being the characteristic life-function of healthy saccharomyces, is dependent on a certain pathologic condition of "non-photobiotic" plant-cells (*i. e.*, cells which habitually live in darkness) generally, which is brought about by immersing them in sacchariferous fluids and shutting them out from the oxygen gas which they need for their healthy development. Hence, even in the ordinary cases of fermentation, the normal life of the yeast-plant on the one hand, and the dissociation of the sugar on the other, are not only not necessarily related, but, in the individual cell, positively exclude each other. In any given mass of yeast, healthy cells and diseased cells are in general mixed up together, and thus, in practice, the two phenomena come to be accidental concomitants. But this brings us back almost precisely to the later views of Liebig, as set forth in his last memoir on the subject.

In regard to the genesis of the yeast plant little is known According to Pasteur's experiments and observations the yeast which forms spontaneously in grape juice is derived chiefly from certain germs which abound about harvest time on the grapes, and still more on the grape-stalks. These germs are largely diffused also through the atmosphere of breweries, wine cellars, and laboratories where fermentation experiments are carried on, but they are not by any means widely diffused through the atmosphere generally.

2. *Lactic Fermentation.*—Milk when left to itself in warm weather, as everybody knows, soon turns sour, the main feature in the chemical process being the transmutation of the milk sugar into lactic acid, as expressed by the equation

$$\underset{\text{Hydrated Milk sugar.}}{C_{12}H_{22}O_{11}.H_2O} = \underset{\text{Lactic acid.}}{4C_3H_6O_3}$$

The milk sugar, before assuming the form of lactic acid, probably passes through the condition of glucose. At any rate, ordinary glucose, when dissolved in milk, ferments into lactic acid along with the milk sugar originally present. But in this case if the total percentage of sugar goes beyond a certain limit, the reaction comes to a stop as soon as the acidity of the liquid has attained a certain limit-value. Addition of chalk or carbonate of soda, *i. e.*, conversion of the lactic acid into a neutral lactate, then revives the process. A solution of "invert-sugar" (as produced by boiling cane sugar water with a little vitriol), when mixed with excess of chalk and some putrid cheese, and kept at 30°–35° C., soon ferments, with formation of large quantities of lactate of lime (Bensch). Lactic fermentation, according to Pasteur, is caused by the development in the mass of a microscopic fungus, consisting of cylindrical cells which are far smaller than those of saccharomyces. We are not aware that this "lactic ferment" has ever been seen in ordinary sour milk; in Bensch's process it is produced largely as a grayish deposit on the chalk, from which pure growths of the fungus may be obtained by Pasteur's method (see above). The lactic ferment, to the annoyance of brewers, frequently occurs in ordinary yeast as an impurity.

There is no doubt that that fungus which Pasteur calls *the* lactic ferment is capable of inducing lactic fermentation; but it does not by any means follow that it is the thing which actually causes the souring of milk under ordinary circumstances. On the contrary, from a remarkable set of experiments made by Lister in 1873, this appears not to be the case. According to him, milk can be completely purged of germs by exposing it (within a germless flask) to the temperature of boiling water for some hours, and, when protected against atmospheric germs by a slightly carbolized stopper of cotton wool, keeps sweet for an indefinite time. Specimens of such germless milk, when exposed to the atmosphere of his study, were found by Lister to undergo a variety of fermentative changes, accompanied sometimes by the development of an acid reaction, but none of them set into sour milk. A specimen of ordinary unboiled dairy milk when kept in the same room did get sour as usual, and, when examined under the microscope, was found to contain, not Pasteur's fungus, but a kind of motionless bacterium which Lister calls *B. lactis*, because the introduction of it (or rather of a trace of the sour milk containing it) into the germless milk determined normal lactic fermentation, the *Bacterium lactis* multiplying at the same time. The same bacterium, when made to pass successively through germless urine and other germless organic liquids, underwent a series of metamorphoses, but, when ultimately put back into milk, caused normal lactic fermentation. The germs of this bacterium must be assumed to abound in the atmosphere of cows' stables and dairies, although they do not seem to be abundantly diffused through the atmosphere generally.

3. *Viscous Fermentation* is a peculiar change which has long been known to occasionally accompany vinous fermentation, and which manifests itself in this that the wine becomes thick and viscous, so that, when poured from one vessel into another, it draws into long threads. This property is caused by the presence of a kind of gum (of the composition $C_{12}H_{20}O_{10}$) which is invariably accompanied by mannite, a sweet crystalline substance of the composition $C_6H_{14}O_6$ (*i. e.* containing the elements of glucose $C_6H_{12}O_6$ + those of hydrogen, H_2). The exact nature of the reaction is not established; in fact, we do not know whether it is one reaction or a set of reactions going on simultaneously. According to the usually adopted equation, 100 parts of cane sugar should yield 51 of mannite, 45·5 of gum, and 6 of carbonic acid. According to Péligot (supported by Pasteur) the "viscous ferment" is a fungus consisting of very minute spherical cells (of 0·001 to 0·0014 millimetre diameter).

4. *Butyric Fermentation.*—In the lactic fermentation of glucose, as induced by milk or cheese in the presence of chalk, the lactate of lime is no sooner formed than it undergoes itself a further change, which, chemically, is represented approximately by the equation

$$\underset{\text{Lactic acid.}}{2C_3H_6O_3} \qquad \underset{\text{Butyric acid.}}{C_4H_8O_2} \quad + \quad \underset{\text{Carbonic acid.}}{2CO_2} \quad + \quad \underset{\text{Hydrogen gas.}}{2H_2}$$

The temperature most favorable to the change lies near 40° C. A number of similar changes (of other organic acids than lactic) are known, but they are passed over here, being of a more purely scientific interest. According to Pasteur, butyric fermentation is caused by the development in the mass of a special kind of vibrio, a worm-shaped animalcule, consisting of a number of longitudinal cells, each about 0·002 millimetre thick, and from 0·002 to 0·02 mm. long. Butyric fermentation, strictly speaking, is only one of a large genus of changes customarily summed up under the generic name of putrefaction.

5. *Putrefaction.*—The scientific meaning of this term coincides pretty much with its popular acceptation, except that it must be understood to be exclusive of all cases of oxidation. In olden times it was assumed that organized matter (the tissues of plants and animals, blood corpuscles, etc.) could hold together even chemically only as long as supported by the vital force. But this is a long exploded notion. In absolute absence of water, or at very low temperatures, dead organized matter remains chemically (and even structurally) unchanged. In support of this assertion we need only refer to that well-known case of the mammoth of the Siberian cave, which was found sweet and fresh thousands of years after the extinction of life. And since the time of Appert (who discovered the now so extensively used process of preserving meats in sealed-up tins) we know that prolonged exposure to boiling heat and subsequent absolute exclusion of air prevent putrefaction, even in presence of liquid water and at the ordinary temperature, as long as the air remains excluded. Chemically speaking, ordinary putrefaction is a most complex phenomenon, always involving the simultaneous on-going of a multiplicity of chemical reactions. A comparatively simple case is the putrefaction of urine, which substantially consists in this that the urea, by assimilating water, passes into carbonate of ammonia, just as it does when heated by itself with pure water to high temperatures. In the case of animal tissues, which, broadly speaking, may be said to consist of fats and albuminoids, the latter always give way first. Their decomposition is a most complex set of successive reactions,—leucine, tyrosine, fatty acids, and many other things appearing as primary products, ammonia, compound ammonias, sulphuretted hydrogen, hydrogen, and nitrogen as secondary ones. Less rapidly, but none the less constantly, the fats are changed, being decomposed, in the first instance, into fatty acids and glycerine, which latter undergoes further transmutations, while the former survive for a considerable time. The "adipocere" which is so well known as one of the constant ultimate products of the decay of dead bodies that have been kept from the air, and which consists of palmitate and stearate of lime (Hoppe-Seyler), well illustrates the high stability of fatty acids. Regarding the causes of putrefaction, we can scarcely do more than refer to what we have quoted from the researches of Schwann and his followers. From these researches two things are clear, namely, (1) that putrefaction is not possible under conditions precluding the development of life, or, in other words, that there is no putrefaction where there is not at least potential life; and (2) that in 999 out of a thousand cases this potential life assumes the actual form of bacteria and vibriones.[1]

Putrefactions going on in presence of air are always accompanied by *processes of oxidation*, the effects of which are difficult to differentiate absolutely from those of putrefaction pure and simple.

C. *Cases of Oxidation.*

1. *Acetous Fermentation* is the best known of these. Everybody knows that weak fermented liquors, when exposed to the air, soon turn sour and ultimately become vinegar. The chemical reaction involved consists of two stages. In the first the alcohol in the liquor absorbs oxygen from the air, with formation of aldehyde and water, according to the equation

$$\underset{\text{Alcohol.}}{C_2H_6O} \quad + \quad O \quad = \quad \underset{\text{Aldehyde.}}{C_2H_4O} \quad + \quad \underset{\text{Water.}}{H_2O}$$

This aldehyde, however, in ordinary acetous fermentation never actually appears, being at once oxidized by the direct action of the air into acetic acid, thus:

$$\underset{\text{Aldehyde.}}{C_2H_4O} \quad + \quad O \quad = \quad \underset{\text{Acetic acid.}}{C_2H_4O_2}$$

These two reactions can be realized in all their chemical simplicity, not, it is true, by oxygen-gas pure and simple, but easily by oxygen as condensed on platinum-black; and as the deoxidized platinum-black readily reabsorbs oxygen from the air, a small quantity of this reagent suffices to oxidize large quantities of alcohol into acetic acid by means of atmospheric oxygen. Upon this observation of Döbereiner's Schützenbach based a rapid and practical method of vinegar-making, which consists in this, that the dilute alcohol is made to trickle through a tower of beech-wood shavings, packed into a tall barrel, constructed so as to draw in an ascending current of air. When a temperature of 20° C. is maintained in the room, and the spirit introduced having a temperature of 26°, the temperature within the barrel is found to rise to 38°–40°, the heat being produced by the rapid oxidation of the alcohol into acetic acid. What, in the old method of vinegar-making, required weeks or months is thus accomplished in a day or even less. It is difficult to avoid the conclusion that in Schützenbach's process the wood-shavings, besides serving to spread the alcohol over an immense surface, act exactly as the platinum-black does in Döbereiner's experiment, condensing oxygen in their pores in order to hand it over to the alcohol. And, supposing this theory to be correct, the old process, which consists in exposing the wine to the air in half-filled tubs or casks, would appear to rest on the same principle,—the wood of the cask acting as the shavings do in Schützenbach's process, only far more slowly. But then it is an old experience of vinegar-makers that the old process at least always involves the formation of two organized products, namely, that of a kind of mould which appears on the surface as a membrane, and goes by the name of "flowers of vinegar," and that of a mucilaginous mass within the liquid, called "mother of vinegar;" and it has always been admitted that the presence of these substances materially accelerates the process of oxidation. This, however, is no contradiction to the theory; it would only prove that the mould-membrane and the mucilaginous mass are more effective carriers of oxygen than the wood of the tub. Besides, in Schützenbach's process, the shavings, according to experience, work the better the freer they are from organized deposits. Hence, one might say, with Liebig, that the efficacy of these substances is a function only of their physical and chemical condition, the presence of life in the mould plant being purely accidental and immaterial to the process. According to Pasteur this view is a mistake. With him it is the membranous mould on the surface of the fermenting liquid which hands the oxygen to the alcohol, and it does so only when it consists of living specimens of a certain species of mould-plant which he calls *Mycoderma aceti.* Other moulds or dead *Mycoderma aceti* do not work. Mother of vinegar, according to Pasteur, is the "non-aërobiotic" form of the mycoderma. Only the aërobiotic form acts. To keep it alive we must take care that the liquid contains the phosphates and the albuminoids or ammonia, which it needs as food. But, if it is to produce vinegar, it must not be fed too liberally, because, when in a vigorous state of health, it oxidizes the alcohol into carbonic acid and water. If the oxidation is to stop at acetic acid, the mycoderma must be in a peculiar abnormal condition, which may be ensured by the presence in the liquid of a certain limit percentage of alcohol. In the case of Schützenbach's process, Pasteur maintains (in spite of apparently contrary experience) that it is the very same *Mycoderma aceti* which enables the wood shavings to act. One of his arguments is the acknowledged fact that Schützenbach's towers require to be started with ordinary vinegar although they can be worked with distilled spirits. A more powerful argument he derives from the following experiment. A very slow current of dilute alcohol was caused to trickle down a long string suspended in a room kept at the most favorable temperature to acetous fermentation. The alcohol failed to assume an acid reaction. But the slightest coating of *Mycoderma aceti* attached to the string caused it to act exactly as the shavings do in the Schützenbach casks. After all, however, it is a little difficult to believe that the many pounds of alcohol which, in the course of a day, pass through a Schützenbach tower and come out below as acetic acid, have all been under the direct influence of the few grains of *Mycoderma aceti* which a microscopist might hunt up amongst the wood shavings. It appears far more rational to assume that the mycoderma acts only indirectly, perhaps by converting a small portion of the alcohol into *aldehyde,* which diffuses itself through the whole mass of the alcohol, and, through its inherent attraction for oxygen atoms, which is assisted by a similar tendency in the porous wood, reduces the stability in a far larger number of oxygen molecules than it needs itself, to such an extent that these so to say half-liberated oxygen atoms become available for the oxidation of alcohol, the more readily as the reaction itself involves a considerable liberation of energy.

2. *Eremacausis.*—Animal and vegetable matters, besides being liable to putrefy, are known, on exposure to air and water, to undergo a slow process of oxidation which ultimately converts them into products of simpler atomic constitution. Speaking quite generally, the process, in the case of wood and vegetable

---

[1] Bacteria are microscopic organisms, composed of two elongated cells united end to end, possessed of varied powers of motion, and almost without exception "rather in themselves reproductive organs" (Lister) than beings possessed of powers of reproduction. The vibriones are seemingly nothing more than polymerized bacteria with intensified powers of locomotion. With regard to their position in the world of life present evidence leaves it uncertain whether they are plants or animals

tissues generally, consists in this, that the hydrogen is eliminated more and more completely—most of it in the form of water, a small portion in the form of marsh gas (CH_4), the rest of the carbon passing gradually into substances more and more closely allied to charcoal. In the case of albuminoids eremacausis is always preceded and accompanied by putrefaction,—the most general effect of the former being that the ammonia produced by the latter is turned into nitrogen and water, or, in the presence of basic substances, such as lime, carbonate of lime, carbonates of alkalies, etc., is oxidized into nitrites and nitrates successively. This process of "nitrification" is going on in all porous soils and waters contaminated with nitrogenous organic matter, and, under favorable circumstances, progresses at a great rate. When sewage is filtered through a bed of porous soil, the drainage waters are generally found almost free from ammonia, the whole of the nitrogen having been oxidized into nitrites and nitrates. According to recent researches by Schlösing and Müntz (which were confirmed by Warrington) nitrification, like acetous fermentation, is determined by the presence in the soil of organized ferments, the chief arguments being that a purely inorganic soil does not act, and secondly, that nitrification in a soil is stopped, or at least very effectually checked, by antiseptic vapors such as those of bisulphide of carbon, chloroform, and carbolic acid. (W. D.)

FERMO, the ancient *Firmum Picenum*, an archiepiscopal city of central Italy, and the chief town of a circle in the province of Ascoli Piceno, 34 miles S. by E. of Ancona. From its situation on a rocky height it commands a splendid prospect of the surrounding country, including a fine view of the Adriatic Sea. It is surrounded by old walls, and besides the cathedral possesses numerous churches and convents, a university, and two fine collections of statuary and paintings. The ruins of the ancient Roman town, which was destroyed in the 5th century, are still to be seen. Lactantius and Galeazzo Sforza were born in Fermo. The port, Porto di Fermo, is situated on the Adriatic, about four miles from the town. The harbor is small, but there is some trade in corn, silk, and woollens. The population of Fermo in 1871 was 7002.

FERMOY, a market-town of Ireland, in the East Riding of the county of Cork, is about 21 miles distant from Cork, and about 130 miles from Dublin, and is connected with both these cities by the Fermoy branch of the Great Southern and Western Railway. It is situated on the river Blackwater, which divides the town into two parts, the larger of which is on the southern bank, and there the trade of the town, which is chiefly in flour and agricultural produce, is mainly carried on. A stone bridge of 13 arches which formerly spanned the river, and which had been erected in 1689, was in the year 1866 removed, and replaced by one of strong cut stone. The town, which strikes the visitor as being exceedingly neat and clean, has several good streets, and some noteworthy buildings. Of the latter, the most prominent are the military barracks on the north bank of the river, capable of accommodating 3000 men, the Protestant Episcopal church, the Roman Catholic cathedral, St. Colman's Roman Catholic college, the convents, and the court-house. Quarter sessions are held in the town, and the municipal affairs are managed by fifteen commissioners, who meet every alternate Wednesday. The market day is Saturday. The population in 1871 numbered 7388, 78 per cent. being Roman Catholics.

FERNAN CABALLERO. See FABER, CECILIA BÖHL VON.

FERNANDEZ, ALVARO, one of the numerous band of Portuguese explorers who, in the earlier part of the 15th century, took part in the search for a sea-passage into the Indian Ocean, was born about the year 1420, and seems to have been brought up as page or esquire to Prince Enrique of Portugal. He was related to Joam Gonsalvez, discoverer of Madeira and governor of Funchal. While still a comparatively young man, he was commissioned to prosecute the exploration of the African coast. After visiting the mouth of the Senegal and landing on the island of Gorée, he succeeded in reaching Cape de Matos or Mastos, the most southerly point that had ever been attained (1446). Soon afterwards he took command of a second expedition, in which the utmost limit reached was Rio Tabite, a little to the south of Rio Grande. Ill health thereafter compelled his return to Portugal, where he was welcomed at court as a distinguished discoverer. See Azurara, *Historia de la Conquista de Guine*, and Joam de Barros, *Asia*, dec. i. lib. i. c. 13, 14.

FERNANDEZ, DIEGO, a Spanish adventurer and historian of the 16th century. He was originally educated for the church, but about 1545 he embarked for Peru, where he served in the royal army under Alonzo de Alvarado. Mendosa, marquis of Cañete, who succeeded Alvarado as viceroy, bestowed on Fernandez the office of chronicler of Peru; and in this capacity he wrote a narrative of the insurrection of Giron, of the rebellion of Gonzalo Pizarro, and of the administration of Gasca. The whole work, under the title *Historia del Peru*, was published at Seville in 1571. It is written in a clear and intelligible style, and with more art than is usual in the compositions of the time. It gives copious details, and, as he had access to the correspondence and official documents of the royalist leaders, it is, although necessarily possessing a royalist bias, the fullest and most authentic record existing of the events it relates. A notice of the work will be found in Prescott's *History of the Conquest of Peru.*

FERNANDEZ, JOAM, a Portuguese traveller, also of the 15th century. Early in life he had been taken captive by pirates of Barbary. While amongst them he acquired a knowledge of Arabic, and had his curiosity stimulated with regard to the geography of the African continent. On regaining his freedom he joined an exploring expedition, and got himself landed at the mouth of the Ouro river (lat. 23° N.), where, exposed to considerable hardship and danger, he spent seven months of a nomadic life with some of the native tribes, and acquired a considerable amount of information about the geography of the interior (1445). Two years afterwards he explored the territory in the neighborhood of Cape Blanco. He deserves some notice as having been the earliest of modern African explorers. The narrative of his adventures, which is said by those who have seen it to resemble that of Mungo Park, is to be found in Azurara's *Conquista de Guine.*

FERNANDEZ, JUAN, a Spanish navigator and discoverer. While navigating the coasts of South America it occurred to him that the south winds that almost constantly prevailed near the shore, and retarded the voyages between Peru and Chili, might not exist further out at sea. His idea proved to be correct, and by the help of the trade winds and some currents at a distance from the coast he made a voyage with so great rapidity that he was apprehended on a charge of sorcery. His inquisitors, however, accepted, with a readiness far from common, his natural explanation of the seeming marvel, and he was set at liberty. During one of his voyages in 1563 Fernandez discovered the two islands which now bear his name. He was so enchanted with their beauty and fertility that he solicited the concession of them from the Spanish Government. It was granted in 1572, but a colony which he endeavored to establish at the largest of them soon broke up, leaving behind them a number of goats, the progeny of which still continue on the islands. In 1574 Fernandez discovered the islands of St. Felix and St. Ambrose, and his companions who survived him affirmed that during a voyage in 1576 in the southern ocean he came in sight of a continent, which must have been either Australia or New Zealand if the discovery is to be accepted as a fact, but more probably it was either a delusion or an invention of his followers. See Alexander Dalrymple, *An Historical Collection of the several Voyages and Discoveries in the South Pacific Ocean*, London, 1769-71.

FERNANDEZ, JUAN, a Spanish sailor and adventurer. In 1531 he joined the army of the celebrated Francesco Pizarro, conqueror of Peru, with a small force, but in 1533 he passed into the service of his rival Pedro de Alvarado. When the latter, however, agreed for a sum of money to cede his claims on Peru and make over his navy to Pizarro and Almagro, Fernandez necessarily returned to the service of Pizarro, who not only granted him pardon, but gave him the command of the ship. In 1538 he accompanied Antonio de Sedeño on an expedition despatched by the Spanish Government against the island of Trinidad. Instead, however, of attempting to fulfil the purpose of the expedition, they were tempted by rumors of the existence of gold to disembark on the mainland, where, after enduring great privations and hardships, both leaders died in the winter after they set out, without finding the object of their quest. The survivors, under four different leaders, and decimated by hunger, fatigue, and continual combats with the natives, managed to find their way to the Spanish settlements.

FERNANDO DE NORONHA, a group of islands in the South Atlantic, about 194 miles N.E. of Cape St. Roque, South America, 3° 50′ S. lat., 32° 25′ W. long. The largest of them is about 20 miles in circumference, its surface is rugged, and it contains a number of rocky hills from 500 to 700 feet high, and a mountainous peak towering to the height of about 1000 feet. The island is covered with wood, but on account of the irregular occurrence of rain, it contains scarcely any other vegetation. It has several harbors defended by forts, and serves as a place of banishment for criminals from Brazil. The next largest island of the group is about a mile in circumference, and the others are small barren rocks. The convict village numbers about 1000 inhabitants, and consists of a square formed by the governor's residence, a chapel, the prison, workshop, and Government stores, and three or four streets radiating upwards, and composed of wattle-built huts. About 1000 additional convicts are employed in cultivating the plantations in different parts of the island. The island is occupied by about 150 soldiers and 6 officers under a governor. Stores, convicts, and mails are carried by steamer twice a month to and from Pernambuco.

See "Visit to Fernando Noronha" by Alexander Rattray, M. D., R. N., in *Journal of the Royal Geographical Society* for 1872.

FERNANDO PO, or Fernao do Pao, an island on the W. coast of Africa, lying in the Bight of Biafra, about 20 miles from the mainland, in 3° 12′ N. lat. and 3° 48′ E. long. It is about 44 miles in length from N.N.E. to S.S.W., and about 20 in breadth. The coasts are steep and rocky, and the interior is mountainous. A ridge of mountains towards the centre of the island rises to the height of 8000 feet, and is terminated at each extremity by a peaked mountain,—the northern one (Ste. Isabelle) attaining a height of 10,700 feet. The southern extremity of the island is also intersected by several steep mountains, varying from 1000 to 3000 feet. These mountains are covered, most of them to their summits, as are the intervening valleys, with dense forests of shrubs and lofty trees of luxuriant growth. The rocks are of volcanic origin; and the soil is rich and fertile, producing rice, sugar-cane, cotton, tobacco, yams, and palms. Antelopes, monkeys, sheep, goats, fowls, turtle, and fish are abundant. The climate is salubrious, though the rainy season lasts from May to December, and is succeeded by a season of dense fogs. The principal harbor, Port Clarence on the northern shore, is frequented by English vessels, especially for palm-oil. This island was discovered in 1471 by a Portuguese navigator, whose name it bears. It was taken possession of by Spain in 1778, but was abandoned in 1782. The English formed a settlement on the island in 1827, and made use of it as a harbor for the ships of war sent to watch the slave traffic, but they relinquished it in 1834; the Spaniards resumed possession of it in 1844, and changed its name to *Puerto de Isabel*. The population is about 15,000, and is composed partly of half-breed Portuguese, negroes formerly freed by the British, a few Europeans, and the native inhabitants called Edeeyahs or Bobies, who are in the proportion of ten to one of all the others, and whose jealous hostility perhaps, as much as the reputed insalubrity of the climate, has prevented the colonization of the island by Europeans. The Baptist missionaries who settled on the island during its occupation by the British were expelled by the Spaniards in 1858. See Benedetti, "Les îles espagnoles du golfe de Guinée," in *Bull. de la Soc. de Géogr.*, 1869.

FERNEL, Jean François (1497–1558), a distinguished French physician, was born at Clermont in 1497. After receiving his early education at his native town, he entered the college of Sainte-Barbe, Paris, where he so distinguished himself in mathematics, philosophy, and languages, that not long after obtaining his M.A. degree he was offered a professorship in the college. This offer he, however, declined, choosing in preference to become a physician. He received his doctor's degree in 1530, and was named professor of medicine in 1534. His extraordinary general erudition, and the skill and success with which he sought to revive the study of the old Greek physicians, gained for him a great reputation, and ultimately the office of physician to the court. He practised with very great success, and at his death in 1558 left behind him an immense fortune.

His principal works are *Monalosphærium, sive Astrolabii genus, generalis Horarii Structura et Usus; De Abditis Rerum Causis; Medicina ad Henricum II.;* and *Consiliorum Medicinalium Liber*. All of them have been several times reprinted.

FERNOW, Karl Ludwig (1763–1808), German art-critic and archæologist, was born in Pomerania, November 19, 1763. His father was a servant in the household of the lord of Blumenhagen. At the age of twelve he became clerk to a notary, and was afterwards apprenticed to a druggist. While serving his time he had the misfortune accidentally to shoot a young man who came to visit him; and although through the intercession of his master he escaped prosecution, the untoward event weighed heavily on his mind, and led him at the close of his apprenticeship to quit his native place. He obtained a situation at Lübeck, where he had leisure to cultivate his natural taste for drawing and poetry. Having formed an acquaintance with the painter Carstens, whose influence was an important stimulus and help to him, he renounced his trade of druggist, and set up as portrait-painter and drawing-master. At Ludwigslust he fell in love with a young girl, and followed her to Weimar; but failing in his suit, he went next to Jena. There he was introduced to Professor Reinhold, and in his house met the Danish poet Baggesen. The latter invited him to accompany him to Switzerland and Italy, a proposal which he eagerly accepted (1794) for the sake of the opportunity of furthering his studies in the fine arts. On Baggesen's return to Denmark, Fernow, assisted by some of his friends, visited Rome and made some stay there. He now renewed his intercourse with Carstens, who had settled at Rome, and applied himself to the study of the history and theory of the fine arts and of the Italian language and literature. Making rapid progress, he was soon qualified to give a course of lectures on archæology, which was attended by the principal artists then at Rome. Having married a Roman lady, he returned in 1802 to Germany, and was appointed in the following year professor extraordinary of Italian literature at Jena. In 1804 he accepted the post of librarian to Amelia, duchess-dowager of Weimar, which gave him the leisure he desired for the purpose of turning to account the literary and archæological researches in which he had engaged at Rome. His most valuable work, the *Römische Studien*, appeared in 3 vols., 1806–1808. Among his other works are—*Das Leben des Künstlers Carstens* (1806), *Ariosto's Lebenslauf* (1809), and *Francesco Petrarca* (1818). Fernow died at Weimar, December 4, 1808. A memoir of his life by Johanna Schopenhauer, mother of the philosopher, Arthur Schopenhauer, appeared in 1810, and a complete edition of his works in 1829.

FERNS, a large group of cryptogamic plants forming in a wide sense a very naturally limited group. In the article Biology (vol. iii. p. 600) it has been shown that the subkingdom Cormophyta includes three well-marked series, *Bryophyta, Pteridophyta, Phanerogamæ*. Of the second of these, Ferns, in the most restricted acceptation of the word, are the most conspicuous representatives. It will be convenient, however, to give some account under the present head, not merely of ferns proper, but also of the other smaller groups, closely related to ferns and often spoken of in familiar language as Fern-allies, which are included in the *Pteridophyta*.

The life-history of all these is divisible into two distinct stages or generations, in which not only are the external morphological characters extremely different, but the physiological functions are also sharply contrasted. These stages have been termed in the article already referred to the *sporophore* and the *oophore*.

The vigorous vegetative forms which are what are familiarly understood when ferns are spoken of are only one phase of their complete life-cycle. They are the sporophores; and the reproductive bodies they bear (spores) germinate without any process of fertilization, and are therefore not to be compared with seeds. The same thing is equally true of the other members of the series *Pteridophyta*, viz., horse tails, club mosses, selaginellas, etc.

A spore on germination produces a structure which, compared with its immediate parent, is relatively very small, and bears no resemblance to it in form or texture. It is called the prothallium; it is green and membranous, and attached to the surface of the ground by root hairs in ferns and horse tails; in adder's tongues and club mosses it is tuberous and subterranean, while in *Rhizocarpeæ* and *Selaginella* it always remains more or less included within the cavity of the parent spore. The function of the prothallium is entirely reproductive; it develops sexual organs of two kinds, archegonia and antheridia, either upon the same or different prothallia. Hence, in contradistinction to the sporophore—the function of which in this group of plants is purely vegetative—the prothallial generation is termed the oophore.

History.—The older botanists, starting from the study of flowering plants, endeavored to recognize in all other cases the same characteristic points of structure. They did not doubt therefore, arguing from analogy, that ferns were provided with true seeds. Gerarde (1597), remarking the appearance of young plants of *Nephrodium dilatatum* in the neighborhood of old ones, attributed this to the dissemination of seeds, "for I believe all plants have seeds in themselves to produce their kindes." No one, however, at this time could say anything definite about the "seeds" of ferns, and they came to be regarded as highly mysterious. It was supposed that they were of an invisible sort, and by a transference of properties it came to be believed that the possessor of fern seed would be invisible too. Shakespeare makes Chamberlaine say, "We have the receit of fern-seed, we walke invisible." Ray ridicules Tragus for spreading linen cloths upon the ground to catch the seed of ferns on the eve of midsummer night, when, as Ray properly observed, it would be indeed astonishing if any fell, seeing that it is not mature till the autumn.

Columna in 1648 compared the fern frond to butcher's broom, and identified the fructification in the one case with the flowers in the other. Cæsius came to his help, and, having examined the *sori* of a polypody, "telescopii adjumento," detected what he supposed to be seeds, but which were probably only the spore cases. W. Cole appears to have been the first to microscopically observe the spores themselves (1669), and Ray himself described the hygroscopic movements of the spore-cases which assist the dispersion of the spores. Morison (1715) seems to have been the first to put the matter to the test of actual experience. He sowed the spores of hart's tongue, and in due course, without, however, distinguishing clearly the two stages, raised plants from them. This important observation fell completely into oblivion, and when in 1789 Dr. Lindsay, a Scotch physician settled in Jamaica, responded to a request of Sir Joseph Banks for fern plants from that island by suggesting that spores would be much more convenient to send, the latter was quite unprepared for the suggestion, which he treated as a great discovery. Dr. Lindsay accordingly wrote a paper on the subject (which was published in the *Linnean Transactions* a few years afterwards), in which he figured the prothallial stages of *Polypodium lycopodioides*. The spores of ferns were still, however, regarded as equivalent to seeds, *i.e.*, as the result of a process of fertilization similar to that which precedes the development of seeds in flowering plants. A variety of attempts were made to see in hairs or glands upon the young fronds, etc., something that would do duty for an anther. As late as 1832 De Candolle maintained the analogy of the prothallium to a cotyledon. In 1844 Nägeli discovered the *antherozoids*, motile bodies which are set free from the *antheridium*, and which perform in ferns the function of pollen grains. All previous observers had tried to find fertilizing bodies on the vegetative generation, the sporophore, which produces only spores. In 1844 the final step was reached when Suminski found upon the prothallia the *archegonia*, flask-shaped bodies containing a central cell (oosphere) which, when fertilized by the antherozoids, develops into a spore-bearing plant similar to that from which the cycle started. In 1850 Mettenius discovered the details of the reproduction in *Isoetes*. Since that time the researches upon the *Pteridophyta* have been very numerous, and are to be found quoted in Sachs's *Lehrbuch*.

The whole group of the *Pteridophyta* may be classified as follows:—

PTERIDOPHYTA.—Cormophyta with two distinct stages in the life-cycle. Sporophore with high vegetative differentiation. Oophore inconspicuous and destitute of vascular tissue.

Class I. *Filicinæ.*—Leaves highly developed. Sporangia numerous on the fertile leaves.

Sub-Class I. *Filices.*—Leaves without stipular appendages. Sporangia epidermal, containing spores of one kind developed in each from a single primary mother-cell.

Sub-Class 2. *Stipulatæ.*—Leaves with stipule-like appendages. Sporangia containing spores of one kind developed in each from many endogenous primary mother-cells.

Sub-Class 3. *Rhizocarpeæ.*—Spores of two kinds.

Class II. *Equisetinæ.*—Leaves rudimentary. Sporangia 5–10 on the fertile leaves.

Class III. *Lycopodinæ.*—Leaves small (except *Isoetes*), simple Sporangia solitary.

Sub-Class 1. *Lycopodiaceæ.*—Spores of one kind.

Sub-Class 2. *Ligulatæ.*—Spores of two kinds.

I. FILICINÆ.—1. The *Filices* or ferns proper deserve consideration at greater length, both on account of their numerical preponderance over the other groups, and the popular favor which deservedly attaches to their great beauty and variety of form.

Commencing with the vegetative generation or *sporophore*, the following remarks briefly touch upon the most essential points in their organization.

In *general habit*, although with a certain characteristic appearance which, to the experienced eye, is an almost unfailing distinctive character, ferns are as various in stature and aspect as flowering plants. One genus, *Ceratopteris*, is remarkable for its aquatic habit. The terrestrial forms vary from the *Hymenophyllaceæ*, which have the small size and delicate texture of mosses, to the larger forms which attain the size of shrubs, while some belonging to the tropics and the southern hemisphere have a palm-like habit, and are called tree-ferns. *Cyathea medullaris* reaches 80 feet in New Zealand, and *Alsophila australis* even greater heights in Australia. The stem creeps on or beneath the surface of the ground as in the common bracken, or climbs up rocks and the trunks of trees (*Davallia canariensis*). In the latter case it is usually densely coated with imbricated membranous scales. In stems of this type the internodes or spaces between the insertion of successive leaves (fronds) is considerable, and the growing point is often far in advance of the youngest frond. In a large number of herbaceous ferns, of which the common male and lady ferns are good examples, the stem is short and erect or slightly inclined (fig. 1). The fronds are developed spirally, and in close contiguity without obvious internodes; they form, viewed from above, a large rosette with the growing point in the centre. Between the ordinary herbaceous ferns with short erect stems and the tree-ferns there is no hard and sharp line of demarcation. Most of the ferns of decidedly arborescent habit belong to the sub-order *Cyatheaceæ*, which has a sporangium and receptacle a little different from that of the typical *Polypodiaceæ*, but in many of the genera of *Polypodiaceæ*, especially *Dicksonia*, there are species that assume a more or less decidedly arborescent habit. Nearly all *Filices* are perennial, but we have an instance of annual duration in *Gymnogramme leptophylla*.

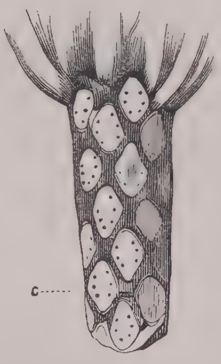

FIG. 1.—Stem of the Male Fern (*Nephrodium Filix-mas*) showing the scars corresponding to the detached bases of the leaves with the marks (*c*) left by the fibro-vascular bundles.

Growing Point.—The apex of the stem, whatever the dimensions of the mature plant, is always occupied by a single apical cell, and the whole growth is entirely dependent upon the repeated segmentation of this cell. In form it is either wedge-shaped with a transverse section like that of a bi-convex lens, or it has the form of a three-sided pyramid with a convex base forming the outer face. In the former case the segments are produced from the cell alternately right and left, and the stem, which is gradually built up by the repeated subdivision of the segments so formed, is always distinctly bilateral, and produces its fronds in two rectilinear series. In the latter case the segments are derived in spiral succession from the three interior faces of the apical cell, and the leaves, which are developed from the masses of tissue to which these segments give rise, are gradually displaced from the simple triseriate arrangement due to the segmentation of the apical cell into more complicated forms of phyllotaxis.

Branching is effected by the partition of the growing point; the single stem therefore bifurcates. This scarcely ever happens in ferns with erect stems, such as *Nephrodium Filix-mas*, or in tree-ferns. New shoots, are, however, sometimes formed from the bases of the leaf-stalks, just as in some species they are normally produced from the fronds themselves. When the terminal point is injured, lateral shoots are often formed in this way. A specimen of *Dick-*

sonia antarctica has been described with as many as twenty-nine crowns, due doubtless to such a cause.

Structure of the Stem.—The repeated subdivision of the cells of the growing point gives rise to a mass of tissue, at first uniform in character, but which is subsequently differentiated. Particular tracts of cells are modified in the process of growth to form the fibro-vascular bundles. These are more or less flattened plates irregularly elliptical in transverse section. As in all the *Pteridophyta* they are closed, and incapable, when once formed, of further increase in diameter. They consist of a mass of "xylem" surrounded by "phloem." The xylem consists, in addition to a few spiral vessels at the foci of the elliptical transverse section, of scalariform vessels—cells of comparatively large diameter, with oblique ends, and with their walls intermittently thickened by transverse projecting ridges (fig. 2). Amongst the vessels are oblong cells containing starch in winter (wood-parenchyma). The phloem contains sieve-tubes, and external to these thick-walled bast fibres. The whole fibro-vascular bundle is bounded first by one or two layers of oblong starch-containing cells (phloem-sheath), and external to these by a single layer of narrower cells, often thickened externally and darker in color—the vascular bundle sheath. In very slender stems the fibro-vascular bundles form a central axis (*Hymenophyllaceæ*), but when the stems attain any size they are arranged in an anastomosing cylindrical network (fig. 3), in which a mesh corresponds to the base of a frond. This cylinder separates the remaining or fundamental tissues of the stem into two portions, an internal central medulla and an external cortex. This is shown in fig. 4; the dark lines, however, do not belong to the bundles which correspond to the light spaces enclosed by them; the dark lines themselves consist of a mass of thickened elongated cells termed "sclerenchyma," which form protecting sheaths to the fascicular tissue. The medulla and cortex are in the main formed of parenchymatous tissue, often loaded with starch. In *Cyathea medullaris* this starchy pith was used by the Maoris as an article of food. The medulla is not, however, entirely parenchymatous; it is usually permeated by a number of anastomosing filiform bundles (usually also invested with a sclerenchymatous sheath), which eventually pass into the leaves through the meshes in the fibro-vascular cylinder. The greater part of the fibro-vascular tissue of the leaves is, however, continuous with the lower portion of the margins of the meshes, which runs out into bundles arranged round the outer circumference of the leaf-stalk, and surrounding therefore the bundles which pass through the meshes from the medulla of the stem. In some cases, however, these medullary bundles contract an adhesion to the margins of the meshes as they pass through them. The surface of the stem, and also of the leaf-stalks, is usually strengthened by the sclerenchymatous development of the superficial portions of the fundamental tissue. This coats the surface with a layer which would be impervious to air were it not interrupted by spaces filled with soft parenchyma, by which the internal tissues of the stem are brought into relation with the atmosphere. In *Pteris aquilina*, the rhizome or horizontal subterranean stem is marked laterally by two lines where the colorless cortical parenchyma is not covered in, and in many tree-ferns the bases of the petioles have their sclerenchymatous investment perforated by pits filled in the living plant by a soft-celled tissue which speedily becomes pulverulent.

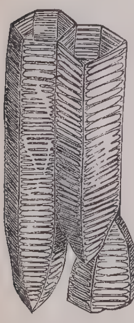

Fig. 2.

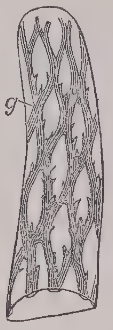

Fig. 3.

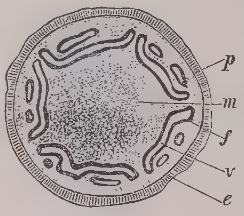

Fig. 4.

Fig. 2.—Scalariform vessels.

Fig. 3.—Fibro-vascular network from the stem of the Male Fern (*Nephrodium Filix-mas*). The spaces contained by the meshes correspond to the attachments of the bases of the leaves.

Fig. 4. Transverse section of the stem of a Tree-Fern (*Cyathea*). *m*, medullary ground-tissue; *p*, cortical ground-tissue; *e*, hypodermal sclerenchyma; *v*, fibro-vascular bundles, with sheathing sclerenchyma (*f*).

The *roots* of ferns are always slender and wiry. They are continually formed during the growth of the stem in acropetal succession. In tree-ferns they consequently accumulate on the lower portion as they grow downward, giving it a large apparent diameter. In creeping species they at once attach themselves. They are cylindrical in all cases, scarcely exceeding one-eighth of an inch in diameter, dark-brown approaching black in color, and clothed with root-hairs.

In ferns the occurrence of a special form of "trichomes" is noticeable in the flat multicellular membranous scales, to which the name of "paleæ" is given. They are found in the greatest abundance on the stem and lower part of the stipes, but they often extend to the rachides of the frond, and sometimes to the foliar surfaces, especially in young fronds. There is no definite correlation in the character of these paleæ with other points of structure. The most characteristic are the long thread-like bright-brown paleæ of *Eudicksonia*, which are so abundant that those of *Dicksonia Culcita* are exported in quantity from Madeira to stuff cushions and mattresses; and the clathrate flat paleæ, dull brown in color and permeated by a distinct lattice-work of thicker cells, which occur in *Vittaria*, *Antrophyum*, and some species of *Asplenium*. By their abundance, position, size, shape, and texture, the paleæ often furnish great help in characterizing species.

Stipes.—Although generally distinguished by this special name, the stipes is simply the petiole of the leaf. It is very rare to find a fern in which the blade of the leaf does not possess a distinct stalk. In about two-thirds of the *Filices*, including not only those with erect, but many with creeping stems, the stipes is continuous with the stem, without any articulation at the point of junction; and when the old fronds die, they do not become disjointed, after the fashion of the leaves of a deciduous tree. In about one-third of the *Filices*, on the contrary, there is a distinct joint at the point of junction between the stipes and the stem, and when the fronds fade, they fall away from the stem spontaneously, leaving a clean scar. In the classification proposed by John Smith, the *Polypodiaceæ* are subdivided by this character. The ferns in which the leaf-stalk is continuous with the stem, as in *Asplenium*, *Nephrodium*, and *Pteris*, he calls *Desmobrya*. Those in which the old fronds become disarticulated at the base, as in *Oleandra*, *Platycerium*, and *Polypodium vulgare*, he calls *Eremobrya;* and he states, as the result of his experience as curator for 40 years of the Kew collection, that the *Desmobrya* may be more easily reproduced from spores, but that the *Eremobrya* show greater tenacity of life, and that in the importation of ferns from abroad the *Eremobrya* generally arrive in good condition, whilst the *Desmobrya*, especially such as have slender stems, often perish in the journey.

Fronds.—In *Filices* we get a more varied range of leaf-form than in any other order in the vegetable kingdom, and some of the most beautiful and complicated types that exist. In size the fronds vary from under an inch, as in some of the minute *Hymenophyllæ*, to a length and breadth of from ten to twenty feet in the great Cyatheas and Dicksonias. To take examples of the leading types from amongst familiar British species, we have simple fronds in *Scolopendrium vulgare*, simply pinnate fronds in *Asplenium Trichomanes* and *Lomaria Spicant*, bipinnate in *Nephrodium montanum* and *Polypodium Phegopteris*, tripinnate or tripinnatifid in *Cystopteris fragilis* and *Polypodium Dryopteris*, and decompound in *Asplenium Adiantum-nigrum* and *Pteris aquilina*. The primary divisions of a compound frond are called pinnæ, the secondary divisions pinnules. In a deltoid frond, as in *Cystopteris montana* or *Pteris palmata*, the pinnæ grow regularly smaller from the lower to the upper, and the lower pinnæ have the pinnules of the under side exaggerated. A decrescent frond, as in *Nephrodium conterminum* or *Asplenium Trichomanes*, has the pinnæ largest at the centre of the frond, and gradually smaller both towards its top and bottom. There is no regular relation between the frond and its fructification. Species with fronds similar in texture, cutting, and veining are often found, when the fructification is examined, to stand widely apart in systematic position. The growth of the fronds is very slow. The whole of the fronds of a rosette of *Nephrodium Filix-mas* have been in course of formation two years before the lamina begins to unroll. The development is basifugal, and often the fronds continue growing at the top a long time after they are fully unfolded and producing fructification at the base. This may be seen in *Hymenophyllum sericeum* and *Gymnogramme elongata;* in *Lygodium* the leaf-stalk resembles a twining stem, growing for a long time. In many cases the fronds are of two kinds, developing from the first in a conspicuously different manner, one kind remaining permanently barren, and the other alone producing fructification. We have instances of this in *Lomaria Spicant* and *Cryptogramme crispa*, and dimorphism is shown still more conspicuously in *Platycerium*, in which the barren fronds are uncut and spread out flat over the surface on which the plant grows, and the fertile ones are much larger, and stand erect, and are forked, from which it takes its common name of elk's-horn fern. There is another striking instance of dimorphism in the section *Drynaria* of the genus *Polypodium*, in which the barren fronds are brown in color, rigid in texture, small in size, and lobed like the leaf of the common oak, and the fertile ones are several feet long, with elongated segments like those of *Polypodium vulgare.* In some ferns the fronds have a habit of taking root at the tip, and thus producing new plants. This is well shown in the walking-leaf of North America (*Scolopendrium rhizophyllum*), and amongst tropical ferns in *Asplenium rhizophorum* and *Acrostichum flagelliferum.* Some species develop copious adventitious buds, from which the plant may be reproduced, sometimes scattered over the surface of the frond, as in *Asplenium viviparum* and *A. bulbiferum*, sometimes in the axils of the pinnæ, as in *Asplenium proliferum* and *Nephrodium cicutarium.*

Venation.—In the arrangement of the veins of the fronds of *Filices* there is an extraordinary amount of variety. The different types, and the extent to which they prevail, and the use that may be made in the systematic arrangement of ferns of the characters they furnish, were carefully worked out by Presl and John Smith. The two principal leading types are veins, that, after once branching, do not again unite, and veins that, on the contrary, after branching, join one another so as to inclose areolæ like the meshes of a net. Ferns that exhibit the first plan are said to be free-veined; the other kind are said to have anastomosing venation. The free-veined ferns form far more than half of the order. In the whole frond or its ultimate divisions there may be a midrib alone, as in *Monogramme graminea* or *Hymenophyllum tunbridgense;* or the veining may be simply pinnate, that is to say, a midrib with a series of parallel simple branches on each side, as in *Nephrodium patens* or *N. prolixum;* or there may be a regular midrib from the base to the top of the frond or segment, with the side-branches branched again, a very common type shown in *Pteris aquilina* and *Nephrodium Filix-mas;* or there may be no regular midrib, but the veins arranged like the rays of a fan, as in *Adiantum Capillus-Veneris* and *Asplenium cuneatum.* Whether the veins are produced to the margin, or end abruptly without reaching it, as is common in the free-veined, and still more so in the net-veined species of *Polypodium*, is a point to be noted. Of anastomosing venation the following are the principal types:—

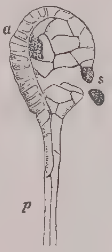

FIG. 5.

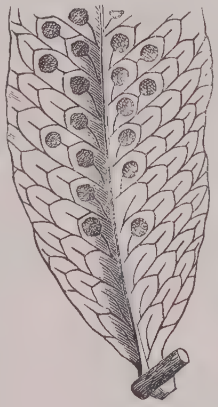

FIG. 6.

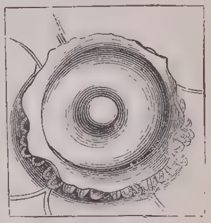

FIG. 7.

FIG. 5.—Mature sporangium of the Male Fern (*Nephrodium Felix-mas*). *p*, stalk; *a*, annulus; *s*, spores discharged from ruptured cavity.

FIG. 6.—Leaf of *Polypodium* of the section *Goniophlebium*, bearing sori on its back.

FIG. 7.—Sorus of *Aspidium trifoliatum.* The annulate sporangia are covered by an orbicular indusium attached by its centre.

1. Where the viens are free nearly to the edge, but connected by an arch just within it, as in the section *Thamnopteris* of *Asplenium* and *Olfersia* of *Acrostichum.*

2. Where the veins are arranged in parallel pinnate groups, and the opposite veins of contiguous groups join at the tip, as in the section *Eunephrodium* of *Nephrodium* and *Goniopteris* of *Polypodium.*

3. Where the veins of contiguous segments are copiously pinnate and free, but the midribs are connected by a single arch and the base, as in the section *Campteria* of *Pteris* and *Pleocnemia* of *Polypodium.*

4. Where the veins unite in regular hexagonal meshes the sori borne at the tip of a single central vein which these inclose, as in the section *Goniophlebium* of *Polypodium.*

5. Where distinct main veins run from the midrib to the edge of a frond or its divisions, and these are connected by a series of parallel arches, from the upper side of which several free veins arise, bearing sori at their tips, as in the section *Campyloneuron* of *Polypodium.*

6. Where distinct main veins run from the midrib to the edge of a frond or its divisions, with copious small irregular areolæ between them, as in the section *Pleuridium* of *Polypodium* and *Gymnopteris* of *Acrostichum.*

7. Where the whole space between midrib and margin is filled up with copious small irregular areolæ, as in the section *Phymatodes* of *Polypodium* and *Chrysodium* of *Acrostichum.*

Many of the large genera, as characterized by the shape and position of the sori, contain groups which show several of these different plans of veining; *Polypodium* and *Acrostichum* show them nearly all. One school of systematists, represented in England by J. Smith and Moore, regard a decided difference in veining as a character important enough in itself to mark a genus; and if this plan be followed the number of genera is enormously increased. Our estimate of 50 for the genera of *Polypodiaceæ* is a large one, if genera founded upon fructification be understood; but Moore, using, venation in addition, reckons the genera at 143, and John Smith at 194. From this different scale upon which genera have been planned arises the large number of different generic names which have often been used for the same plants, so that the synonymy of ferns has become extremely complicated.

The *sporangia* of ferns are morphologically trichomes or modified hairs. They originate from epidermal cells, and in the mature state consist of stalked capsules, the walls of which are one cell thick. A ring of cells differently placed in different genera is called the *annulus*, and by its unequal contraction in drying effects the disruption of the capsule and the dispersion of the spores (fig. 5). In some genera the same object is effected by a group of cells instead of a ring. The separate clusters, of few or many individual sporangia, are called sori (fig. 6), and the membranous excrescence of the epidermis which covers a sorus is called an indusium or involucre (fig. 7).

The orders of *Filices* are founded upon differences in the structure of the individual sporangium. Genera of the same order depend upon differences in the shape and position of the sori and shape and position of the indusium. In a few genera, such as *Osmunda*, *Anemia*, and *Schizæa*, the parenchyma of the lamina is entirely absorbed in the fertile parts of the frond, and the sporangia form distinct panicles or spikes. In *Acrostichum* the sporangia cover the whole of the under surface of the frond, both veins and interspaces. In many genera, such as *Pteris*, *Vittaria*, and *Lindsaya*, the sori run in a line along the very edge of the frond, connecting the tips of numerous veinlets. In *Blechnum* they form a similar line close to the midrib. The commonest type of all is when they form round dots on the veins of the back of the frond, as in *Polypodium*, *Aspidium*, *Woodsia*, and *Cyathea.* A type only less common than the last is where they run in lines along the veins of the back of the frond, as in *Asplenium*, *Scolopendrium*, and *Gymnogramme*. In *Lygodium* the sporangia form spikes on the edge of the leafy segments, each sporangium inclosed in a little pocket. In *Dicksonia*, *Hymenophyllum*, and *Trichomanes*, the sori form round clusters at the tip of a vein on the edge of the lamina. Characters taken from the indusium separate the genera of *Polypodiaceæ* into four tolerably well-marked groups. In a large series of genera, including *Polypodium* with not less than 400 species, *Acrostichum*, and *Gymnogramme*, there is no indusium at all. In another series, including *Pteris*, *Pellæa*, *Cheilanthes*, and *Hypolepis*, there is what is called a spurious indusium, which consists simply of the edge of the frond modified in texture and more or less completely recurved, so as to protect the sorus in an early stage. The true indusia are distinct scales, and are of two kinds,—those called inferior, which originate beneath the sorus, and may be distinctly cup-shaped, as in *Woodsia* and *Cyathea*, or may be one-sided, as in *Cystopteris* and *Davallia;* and those called superior, as in *Nephrodium* and *Aspidium*, which are extended over the sorus. As has been already indicated, all the genera of *Polypodiaceæ*, which include in the aggregate not less than 2000 species, agree with one another in the structure of the sporangia, so that the great majority of existing forms of *Filices* are very closely allied. The classification of ferns is based at present upon characters entirely drawn from the sporophore generation, and takes no account of the oophore. It is undoubtedly to a great extent artificial, but until the development of the prothallium has been carefully worked out in all the different orders, no more satisfactory or more natural arrangement than the following appears attainable.

1. *Gleicheniaceæ.*—Sporangia sessile, splitting vertically, furnished with a complete horizontal ring. Sori composed of very few sporangia; receptacle not elevated. Fronds with very distinct dichotomous branching. Genera 2; species 30.
2. *Hymenophyllaceæ.*—Sporangia sessile, splitting vertically, furnished with a complete horizontal ring. Sori composed of numerous sporangia, inserted on a long filiform receptacle. Fronds of filmy texture, with pinnate branching. Genera 2; species 150–200.
3. *Cyatheaceæ.*—Sporangia nearly sessile, splitting transversely, furnished with a usually incomplete nearly vertical but rather oblique ring. Receptacle prominent, barrel-shaped. Tree-ferns. Genera 3; species 150.
4. *Polypodiaceæ.*—Sporangia stalked, splitting transversely, furnished with a usually incomplete vertical ring. Receptacle not prominent. Genera 50; species 2000.
5. *Osmundaceæ.*—Sporangia stalked, splitting vertically, furnished with only a faint horizontal bar instead of a ring. Genera 2; species 10–12.
6. *Schizæaceæ.*—Sporangia sessile, splitting vertically, crowned by a complete small annular horizontal ring. Genera 5; species 60.

The *oophore*, or sexual generation of ferns, not having been studied to any great extent from the comparative point of view, can only be described in general terms. It is a membranous structure furnished with root hairs, and the cells of which contain chlorophyll; it is therefore capable of obtaining its nourishment independently, and in many respects has a striking resemblance to the simpler *Hepaticæ*. When the spores (for example) of any Polypodiaceous fern are sown, the outer covering bursts, and the inner coat protrudes as a filament, which soon divides and continues to grow into a short row of cells. Cell division next begins to take place laterally as well as longitudinally, and a small cellular plate is formed (Fig. 8), which gradually attains a kidney-shaped outline, the growing point being situate in the notch. From the under side are developed the root-hairs, antheridia and archegonia.

The *antheridium* is morphologically a trichome, and is an outgrowth of a superficial cell. The wall when mature consists of a single layer of cells, inclosing a central cell, from which the antherozoids are developed in separate mother cells. The antheridium eventually bursts owing to the absorption of water, and the spirally-twisted motile ciliated antherozoids (fig. 9) are set free (fig. 10).

The *archegonia* are produced on a cellular cushion immediately behind the notch. They are developed by repeated divisions from a superficial cell, and, when mature, each is a bottle-shaped structure (fig. 11), the rounded base of which is buried in the prothallium, and contains a central cell, the oosphere. The canal of the neck is at first filled by a cell, which eventually deliquesces, and leaves the passage open for the access of the antherozoids to the oosphere, which, after fertilization by blending with them, becomes the oospore. The oospore first divides by a division-wall oblique to the prothallium, and then divides again so as to form four cells. Two of these give rise to a mass of tissue which remains in contact with the prothallium, and is called the foot. Of the other two, one develops into the stem (first leaf), the other into the root. As soon as the young fern-plant (sporophore) is fairly established (fig. 12) the prothallium (oophore) disappears. Its existence is therefore remarkably contrasted by its brevity with the oophore stage in the *Bryophyta*. There are, however, cases in which the conditions of the one group are approached by the other. In *Osmunda* the prothallia admit of vegetative reproduction by the detachment of marginal shoots. In *Gymnogramme leptophylla*, Goebel has shown that the prothallium vegetates in a persistent way, comparable to that of the oophore stage in a moss. The sporophore is very transient in its existence, only living for a few months, and being entirely devoted to the production of spores. Amongst *Bryophyta*, in *Anthoceros* the sporophore exhibits a continued production of spores, which places it nearly on a level with *Gymnogramme*. Farlow has made the remarkable observation that the sporophore may in some case originate from the prothallium without the intervention of a sexual process, by a process of budding.

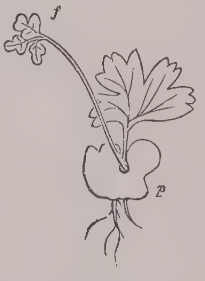

FIG. 12.—*f*, Young Fern-plant (sporophore) of *Pteris palacea*, arising from a fertilized archegonium of *p*, the prothallium (oophore).

2. The *Stipulatæ* include two orders often included among ferns, but differing from them in some very important points. *Ophioglossaceæ* include *Ophioglossum* (adder's tongues) and *Botrychium* (moon-worts), both widely distributed, and *Helminthostachys*, which is found from the Himalayas to Queensland. The leaves as soon as they have attained a certain age bear a fertile branch from the axial side. The sporangia are developed in a manner totally different from those of other *Filicinæ*. Instead of being products of single epidermal cells their origin resembles that of the pollen-sacs of anthers. The sexual generation (oophore) is tuberous and subterranean.

Marattiaceæ is a group of ferns including about four genera. All are essentially tropical, but run more into the south than the north temperate zone. *Danæa* is exclusively American, *Kaulfussia* and *Angiopteris* Old World, *Marattia* cosmopolitan. The sporangia are placed on lateral veins of the pinnæ, and contain two rows of loculi, each of which corresponds to a single sporangium of *Ophioglossum*, and produces a number of spores originating from many primary mother-cells. The development of the sporangia in *Angiopteris*, which differs from other *Marattiaceæ* in the sporangia not being confluent, is still a desideratum for the determination of its affinities.

3. *Rhizocarpeæ* are plants whose affinities have long been obscure, but which are now gradually being seen to be related in many essential points to ferns, though departing from them in other respects. In the growth of the roots, mode of branching, and circinate vernation there is entire agreement, and the fructification, though apparently very different, clearly admits of comparison with the true fern type. For a detailed account of their structure reference must be made to the works referred to below. It will be sufficient here to briefly refer to the fructification. *Rhizocarpeæ* include two orders, *Marsileæ* and *Salvinieæ*. The former consists of the two genera *Pilularia* and *Marsilea*. The former consists of three species of small creeping plants with filiform leaves, one of which is not uncommon in marshy places in Britain; the fruit (sporocarp) is globular, shortly stalked, and springs from the axils of the leaves. The sporocarp is divided by partitions into from one to four cavities, and each of these bears on its outer wall a projecting ridge to which the sporangia are attached. The species of *Marsilea* are widely distributed mostly in hot countries; *M. macropus* is the nardoo of Australia. They all agree in having leaves and long stalks and two pairs of leaflets arranged cross-wise; one pair is developed by lateral branching, the other pair by dichotomy of the growing point. The sporocarp is variously placed, but always in relation to a leaf. Sachs considers that in both *Marsilea* and *Pilularia* the sporocarps are modified leaves bearing the sporangia on their upper sides in definite relation to the fibro-vascular bundles. With regard to position he compares them to the fertile fronds of *Ophioglossaceæ*. In *Marsilea* the sporocarp is bean-shaped, and the sporangia are attached to transverse ridges in small compartments which are torn away in the peculiar dehiscence of the sporocarp (fig. 13).

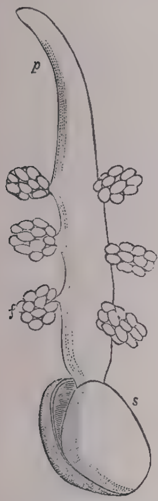

Fig. 13.—Sporocarp (*s*) of *Marsilea Fabri*, discharging a gelatinous cord (*p*) to which the contents of the compartments of the sporocarp are attached; these compartments (*f*) contain both macrosporangia and microsporangia.

The *Salvinieæ* include *Salvinia* and *Azolla*. *Salvinia* is a cosmopolitan genus of five or six species of floating plants distributed over the tropical and warm temperate zones. The sporocarps are developed from teeth of the fertile leaves round which in each case a circular wall grows up covering in the tooth on which the sporangia are developed. This arrangement has been compared to the cup-shaped "involucre" of *Hymenophyllum*. The sporangia are in all the genera trichomes, and their mode of development is very similar to that in *Polypodiaceæ*. The central mother-cell divides ultimately into eight spore mother-cells. The further progress, however, of these varies according as microspores or macrospores are to be formed, each of the eight cells dividing into four in the one case, while in the latter only one does so, and only one of the four daughter-cells attains maturity.

The oophore or prothallial generation in *Rhizocarpeæ* is diœcious from the first, the macrospore alone producing archegonia. This, however, only carries to an extreme point a differentiation of which there are indications amongst ferns. In *Osmunda* all the spores from a sporangium sometimes produce prothallia with antheridia alone. In *Rhizocarpeæ* the differentiation is carried back to the spores themselves. The microspores are male (fig. 14); in *Salvinia* there is a rudimentary prothallium which produces antheridia, and in *Marsilea* and *Salvinia* there is a last trace of such a structure. The macrospores also develop a prothallium from a portion of their contents, which, however, is always for the most part included in the parent spore, which ruptures to expose the archegonia (fig. 15), and allow of the fertilization of one of them.

Fig. 18.—Transverse section of rhizome of *Equisetum Telmateia*. *g*, fibro-vascular bundles; *l*, air-canals.

II. Equisetinæ are plants the habit of which in the asexual stage (sporophore) is very singular. The stems are furrowed and jointed, the joints being hollow and closed at each node by a transverse septum (fig. 16). The leaves are reduced to a whorl of membranous teeth which form a sheath at each node, perforated by the slender branches, which also form a verticil. The teeth of each successive

Fig. 21.—Spore of *Equisetum* with the four elaters, produced by splitting of the exospore, dry and expanded.

Fig. 22.—The same with the elaters damp and coiled up.

node alternate. The fibro-vascular bundles also alternate in each successive internode, since they are arranged in a ring, and correspond to the ridges between the furrows which above are continuous into the teeth of a leaf-sheath (fig. 17). Each fibro-vascular bundle contains an air-canal, and another series of air-canals alternate with these and correspond to the furrows (fig. 18). The spore-bearing shoots are usually a good deal different in appearance from the barren stems; they terminate in a kind of cone (fig. 19) composed of closely approximated whorls of modified leaves, which are peltate in form, and bear from 5 to 10 sporangia on their under surface (fig. 20). The spores are furnished with an external coat which splits up into four strips, the hygroscopic movements of which actively assist their dispersion (figs. 21, 22). The oophore consists of a prothallium, which is curiously lobed and curled, but otherwise differs little from that of ferns.

III. Lycopodinæ (*Dichotomæ*, Sachs).—With a considerable range of morphological variation the different genera agree in some important points. The leaves are always simple and unbranched, and contain only a single fibro-vascular bundle. The branching of stems and roots is always dichotomous, and the dichotomies, with some exceptions, succeed one another in planes at right angles. In their reproductive processes *Lycopodiaceæ* and *Ligulatæ* are related in the same manner as *Filices* and *Rhizocarpeæ*.

Fig. 28.—Vertical section through the upper part of a macrospore of *Selaginella*, showing the prothallium with unfertilized archegonia, and an embryo growing downwards into the endosperm.

1. *Lycopodiaceæ*, besides the club-mosses (*Lycopodium*), includes three other small genera, *Psilotum*, *Tmesipteris*, and *Phylloglossum*. The first belongs to the warm countries of the new world, and is a singular plant with slender dichotomizing stems, very small leaves, and no true roots. *Phylloglossum* is a minute Australian plant, with a small tuber which produces a rosette of a few long leaves and a stalked spike of sporangia. The species of *Lycopodium* (fig. 23) attain a more vigorous vegetative development, some almost reaching the size of small shrubs. Their stems contain an axial cylinder, formed by the greater or less coalescence of a number of fibro-vascular bundles forming transverse bands in cross-section. These bands are composed of xylem, with wide scalariform vessels and spiral vessels at each end; between the xylem plates are the phloem common to each, and containing sieve-tubes. The whole surface is surrounded by a phloem-sheath and a fibro-vascular bundle sheath. The cortical tissue surrounding the axial cylinder is often largely converted into sclerenchyma. The sporangia of *Lycopodium* make their appearance upon the upper surface of the fertile leaves (fig. 24), and, according to Sachs, are developed from the sub-epidermal tissue. The spores are only of one kind (fig. 25), and on germination, according to the observations of Fankhauser, produce a subterranean prothallium, resembling that of *Ophioglossaceæ*, and bearing antheridia and archegonia.

2. *Ligulatæ* includes two orders markedly different in vegetative characters. In both the leaves are furnished at the base with a small appendage called a ligule, wanting in the *Lycopodiaceæ*.

Selaginelleæ.—The ramification of *Selaginella* often produces flat frond-like systems of branches, owing to the regular suppression of one side of the dichotomies. The leaves, which are arranged in four longitudinal rows, are in these cases often unequal, those attached to the under side of the horizontally spreading stem being larger than those on the upper side. The structure of the stem differs from that of *Lycopodium* in having no axial cylinder, the fibro-vascular bundles being distinct from one another although transversely expanded like those of *Lycopodium*. In details of structure they agree with the bundles of ferns. Each is often surrounded by a system of air-cavities. The roots branch dichotomously. The sporangia of *Selaginella* are shortly stalked, and are inserted in the axil or even in the base of a leaf; the fibro-vascular bundle runs beneath it without sending a branch into it. Macrosporangia (fig. 26), containing usually four macrospores, occur in the same spike with the microsporangia. For a detailed account of the prothallial stage (oophore) of *Selaginella* reference may be made to Sachs's text-book. The female prothallium is more distinctly endogenous than even in *Rhizocarpeæ*. It is formed from a portion of the contents of the macrospore (fig. 27), which ruptures partially, exposing the prothallium with its first archegonium. The remaining part of the cavity of the spore becomes filled with a cellular tissue, which may be compared to the endosperm of phanerogams. This is not the only point in which the reproduction of *Selaginella* approaches that of flowering plants. The oospore first divides transversely, in which respect it differs widely from *Filices* and *Rhizocarpeæ*. The upper half forms the *suspensor*, a structure wanting in all other cryptogams, but characteristic of phanerogams. The lower half forms the embryo, which by the elongation of the suspensor is at first carried down into the endosperm (fig. 28), the cells of which it partially absorbs in its further development. The microspores produce the antherozoids, containing, in addition, traces of a rudimentary prothallium.

The *Isoeteæ* consist of the species of the monotypic genus *Isoetes*, which, almost always aquatic in habit, are found all over the world. They are all remarkable for the extraordinarily slow growth in length and absence of branching in the stem, which consists of a small tuberous body bearing the rosette of leaves without internodes. It has the unique peculiarity amongst the vascular cryptogams of increasing in diameter by additions to the parenchymatous cortical tissue external to the central fibro-vascular axis. The sporangia of *Isoetes* are produced at the bases of the leaves, and are unquestionably foliar products; the outer leaves of the rosette produce only macrosporangia, the inner only microsporangia. The macrospores are entirely filled by the female prothallium, the wall being finally ruptured at the apex, as in *Selaginella*.

Reference may be made to the article Biology for a general view of the relations of the reproductive processes in *Pteridophyta* to other *Cormophyta*, and especially phanerogams. FEROZEPORE. See FIROZPUR.

FERRAND, ANTOINE FRANÇOIS CLAUDE, COMTE (1751–1825), statesman and political writer, was born at Paris July 4, 1751, and entered the Parlement de Paris at the early age of eighteen as "conseiller aux enquêtes." During the Revolution he belonged to the emigrant party, and from 1794 to 1801 led a quiet life at Ratisbon, employing himself in literary work. In 1814 Ferrand was made minister of state and directeur général des postes. It was he who, as ministre du roi, countersigned the act of sequestration of Napoleon's property, and who, in introducing a bill for the restoration of the property of emigrants, established a distinction, since become famous, between royalists of "la ligne droite" and those of "la ligne courbe." At the second restoration, Ferrand became again directeur général des postes. He was also made a peer of France, member of the privy council, grand-officier and secretary of the orders of Saint Michel and Saint Esprit, and in 1816 member of the Academy. In his old age he became blind and enfeebled. He died January 17, 1825.

Besides a large number of political pamphlets, Ferrand is the author of *l'Esprit de l'histoire, ou Lettres d'un père à son fils sur la manière d'étudier l'histoire*, 1802, which reached seven editions, the last number in 1826 having prefixed to it a biographical sketch of the author by his nephew Héricart de Thury; *Éloge historique de Madame Élisabeth de France*, 1814; *Œuvres Dramatiques*, 1817; *Théorie des révolutions rapprochée des événements qui en ont été l'origine, le développement, ou la suite*, 1817; and *Histoire des trois démembrements de la Pologne, pour faire suite a l'Histoire de l'Anarchie de Pologne par Rulhière*, 1820.

FERRARA, a city of Italy, at the head of a circondario and province of the same name, is situated in a flat alluvial district at the junction of the Po di Volano with several minor branches of the complex water-system of lower Lombardy. At the times of greatest inundation the river rises about 7 or 8 feet above the level of the castle court, but the statement that it sometimes even reaches above the level of the roofs is an exaggeration, and the city affords an asylum to the people of the surrounding country when the district is under water. The distance from Bologna by rail is about 29 miles, and from Venice 70. As it long occupied an important strategical position as a frontier post of the papal states, Ferrara is strongly fortified by walls, bastions, ditches, and a pentagonal citadel. Within the circuit of its defences, which extend for nearly 5 miles, a large part of the area is unoccupied. In the very centre of the city stands the old ducal castle or palace, surrounded by a moat, and crowned with heavy machicolations and battlements. During the papal period it was the residence of the legate, and it is now the seat of the local authorities. The cathedral of San Paolo is a large building originally dating from the 12th century, but gutted and restored in the 17th. The west front, of which a view is given in Mr. Street's *Brick and Marble Architecture*, is a great screen with "three gables of about equal height covered with arcading, which increases in depth and richness of moulding and shadow to the top, where there are very fine open arched galleries." Of the other churches it is sufficient to mention S. Francesco, S. Benedetto, S. Domenico, and S. Maria del Vado, which contain paintings by Garofalo, Dosso Dossi, Bonone, and other native artists. The palaces are for the most part of small architectural interest: the *Palazzo de' Diamanti* owes its name merely to the facets into which the stones of the front are carved. The theatre is one of the largest in Italy; and the university, or *Studio Publico*, has a rich numismatic collection and a library of 100,000 volumes and 1100 MSS., numbering among its curiosities autographic portions of Ariosto's *Orlando Furioso*, letters of Tasso, and the original of Guarini's *Pastor Fido*. The house of the first of these poets is still shown in a street which bears his name; and the hospital of S. Anna is regularly visited as the scene of Tasso's incarceration. Almost all the interest of the city lies in its past, but it shows signs of revival since the unification of Italy. A large factory for scutching and spinning hemp was established in 1874; there are two foundries and a small establishment for the manufacture of brass instruments; and the preserving of peaches is a fairly important industry. A local bank was founded in 1862 with a nominal capital of £83,000. Besides the university, which is free, the educational establishments comprise an industrial and professional institute, a technical school, a communal gymnasium, a lyceum named after Ariosto, and a gymnasium and lyceum attached to the archiepiscopal seminary. The population in 1871 was 28,509, or, including the suburbs of San Luca and San Giorgio, 33,327. Ferrara possibly owes its existence to the invasion of Italy by Attila, and the destruction of Aquilea. It was walled by the exarch of Ravenna in 585, and became the seat of a bishop in 657. In the beginning of the 13th century, it passed into the hands of the Este family, which continued to hold it, sometimes under the pope and sometimes as independent lords, till the extinction of the main line by the death of Alphonso II. in 1597. During the latter part of this period Ferrara was the seat of one of the most cultured of the Italian courts, and its name has become for ever associated with the history of Italian literature. Its population is said to have amounted to 80,000. In 1598 it was incorporated with the papal states by Clement VII. During the period of the French supremacy in Italy, it formed part, first of the Cisalpine republic, and secondly of the kingdom of Italy; but the treaty of Vienna restored it to the pope, and granted the Austrians the right of maintaining a garrison. In 1859 it was incorporated in the general kingdom of Italy.

FERRARI GAUDENZIO (1484–1549), a celebrated painter of the Milanese, or more strictly the Piedmontese, school, was born at Valduggia, Piedmont, and learned the elements of painting at Vercelli from Girolamo Giovannone. He next studied in Milan, in the school of Scotto, and some say of Luini; towards 1504 he proceeded to Florence, and afterwards to Rome. His pictorial style may be considered as derived mainly from the old Milanese school, with a considerable tinge of the influence of Da Vinci, and later on of Raphael; in his personal manner there was something of the demonstrative and fantastic. The gentler qualities diminished, and the stronger intensified, as he progressed. Ferrari was again in Rome towards the close of Raphael's life, and is believed to have aided him in the works of Torre Borgia. By 1524 he was at Varallo in Piedmont, and here, in the chapel of the Sacro Monte, the sanctuary of the Piedmontese pilgrims, he executed his most memorable work. This is a fresco of the Crucifixion, with a multitude of figures, no less than twenty-six of them being modelled in actual relief, and colored; on the vaulted ceiling are eighteen lamenting angels, powerful in expression. Other leading examples are the following. In the Royal Gallery, Turin, a Pietà, an able early work. In the Brera Gallery, Milan, St. Katharine miraculously preserved from the Torture of the Wheel, a very characteristic example, hard and forcible in color, thronged in composition, turbulent in emotion; also several frescoes, chiefly from the church of Santa Maria della Pace, three of them being from the history of Joachim and Anna. In the cathedral of Vercelli, the choir, the Virgin with Angels and Saints under an Orange-Tree. In the refectory of San Paolo, the Last Supper. In the Louvre, St. Paul Meditating. In Varallo, convent of the Minorites (1507), Presentation in the Temple, and Christ among the Doctors and (after 1510) the History of Christ, in twenty-one subjects; also an ancona in six compartments, named the Ancona di San Gaudenzio. In Santa Maria di Loreto, near Varallo (after 1527), an Adoration. In the church of San Cristoforo, the transept (in 1532–35), a series of paintings in which Ferrari's scholar Lanini assisted him; by Ferrari himself are the Birth of the Virgin, the Annunciation, the Visitation, the Adoration of the Shepherds and Kings, the Crucifixion, the Assumption of the Virgin, all full of life and decided character, though somewhat mannered. In the church of Saronno, near Milan, the cupola (1535), a Glory of Angels, in which the beauty of the school of Da Vinci alternates with bravura of foreshortenings in the mode of Correggio. In Milan, Santa Maria delle Grazie (1542), the Scourging of Christ, an Ecce Homo, and a Crucifixion. The Scourging, or else a Last Supper, in the Passione of Milan, is regarded as Ferrari's latest work. He was a very prolific painter, distinguished by strong expression, animation and fulness of composition, and abundant invention; he was skilful in painting horses, and his decisive rather hard color is marked by a partiality for shot tints in drapery. In general character, his work appertains more to the 15th than the 16th century. His subjects were always of the sacred order. Ferrari's death took place in Milan. Besides Lanini, already mentioned, Andrea Solario, Giambattista della Cerva, and Fermo Stella were three of his principal scholars. He is represented to us as a good man, attached to his country and his art, jovial and sometimes facetious, but an enemy of scandal. The reputation which he enjoyed soon after his death was very great, but it has not fully stood the test of time. Lomazzo went so far as to place him seventh among the seven prime painters of Italy.

FERREIRA, Antonio (1528–1569), Portuguese poet, was born at Lisbon in 1528. He was of a noble family, and completed his education at the university of Coimbra. Destined for the public service, he applied himself to the study of the law; but although he obtained the degree of doctor, and held a high legal office at Lisbon, he was far more deeply interested in literature than in jurisprudence. The poetry of Horace especially fascinated him; and resolving to write in the Portuguese tongue alone, he set before him as his special task to give to Portuguese poetry a classical purity, precision, and elegance of style. While still at the university he composed most of his *Sonnets*, in which the influence of Petrarch appears, without, however, his passion or his grace. At the same period he produced his comedy of *Bristo*, which he is supposed to have afterwards retouched and perfected. His chief dramatic work is the tragedy of *Inez de Castro*, the first Portuguese tragedy, and the second in modern European literature, the only one of earlier date being the Italian tragedy of *Sofonisba*, by Trissino. Ferreira's elegies are numerous, but few of them bear the impress of sincerity of feeling. One of the most admired is that on "May" and the return of spring. The *Epistles* of Ferreira, forming the largest portion of his works, were the first of their kind in Portuguese literature. They were addressed to many illustrious persons during his residence at court, in the maturity of his powers and knowledge of the world. Usually didactic and serious in tone, studious of correctness and classical elegance of form, the poetry of Ferreira lacked the inspiration of genuine passion and the power to touch the hearts of his countrymen. It never became popular. He was looked up to, however, as an oracle by the critics of his own day, enjoyed the special favor of King John III. and two of his successors, and had reason to hope for a long and honorable career. But he was carried off suddenly in the prime of life by the plague which raged in 1569. His *Poemas Lusitanos* were published in 1598, and a complete collection of his works appeared at Lisbon in 1771.

FERRET (*Mustela furo*), an albino variety of weasel, regarded by some as the descendant of a wild species originally brought from Africa, and now only known in the domesticated state, and by others as a variety of the polecat (*Mustela putorius*), which it closely resembles in size, form, and habits, and with which it is said to interbreed freely. It differs, however, from the polecat in the color of its fur, which is usually yellowish-white, and of its eyes, which are pinky-red. A more important difference, as bearing on the question of its specific distinctness, lies in the fact that while the polecat thrives in the severe climate of northern Europe, the ferret is peculiarly intolerant of cold, and only survives the English winter by means of the artificial warmth to which, under domestication, it is accustomed. The ferret attains a length of about fourteen inches, exclusive of the tail, which measures about five inches. Although exhibiting considerable tameness, it seems incapable of attachment, and when not properly fed, or when otherwise irritated, is apt to give painful evidence of its native ferocity. Tempted by the opportunity of the mother's absence, it has been known to attack the child in the cradle, and having once tasted blood it seems to lose all its acquired shyness, and will then boldly attack any one interfering with the gratification of its bloodthirsty propensity. It is chiefly employed in destroying rats and other vermin, and in driving rabbits from their burrows into nets spread for their reception. For the latter purpose it is usually muzzled, to prevent it devouring its prey and thereafter going to sleep at the bottom of a burrow until roused by hunger to renewed exertion. The ferret is remarkably prolific, the female bringing forth two broods annually, each numbering from six to nine young. It is said to devour its young occasionally immediately after birth, and in this case it produces another brood soon after. The ferret was well known to the Romans, Strabo stating that it was brought from Africa into Spain, and Pliny that it was employed in his time in rabbit-hunting, under the name *Viverra*, of which the English name is probably a corruption.

FERRI, Ciro (1634–1689), a Roman painter, the chief disciple and successor of Pietro da Cortona. He was born in the Roman territory, studied under Pietro, to whom he became warmly attached, and, at an age a little past thirty, completed the painting of the ceilings and other internal decorations begun by his instructor in the Pitti Palace, Florence. He also co-operated in or finished several other works by Pietro, both in Florence and in Rome, approaching near to his style and his particular merits, but with less grace of design and native vigor, and in especial falling short of him in color. Of his own independent productions, the chief is an extensive series of scriptural frescoes in the church of S. Maria Maggiore in Bergamo; also a painting of St. Ambrose, the principal altarpiece in the church of St. Ambrogio della Massima in Rome. The paintings of the cupola of St. Agnese in the same capital might rank even higher than these; but this labor remained uncompleted at the death of Ferri, and was marred by the performances of his successor Corbellini. He executed also a large amount of miscellaneous designs, such as etchings and frontispieces from books; and he was an architect besides. Ferri was appointed to direct the Florentine students in Rome, and Gabbiani was one of his leading pupils. As regards style, Ferri ranks as chief of the so-called Machinists, as opposed to the school founded by Sacchi and continued by Carlo Maratta. He died in Rome —his end being hastened, as it is said, by mortification at his recognized inferiority to Bacciccia in color.

FERRIER, James Frederick (1808–1864), metaphysician, was born in Edinburgh on 16th June, 1808. His father was a writer to the signet, and his grandfather was an intimate friend of Sir Walter Scott. His mother was sister of Professor John Wilson. In his early youth he lived in the family of the Rev. Dr. Duncan, in the manse of Ruthwell, Dumfriesshire, and under Dr. Duncan's tuition he acquired a strong liking for the Latin poets, which remained with him all his days. After attending Edinburgh High School he studied under Dr. Burney at Greenwich, and was a student of Edinburgh University in sessions 1825–26 and 1826–27. He took the B.A. degree at Oxford in 1831. In 1832 he passed as an advocate at Edinburgh. Probably it was his metaphysical tastes which led him to Heidelberg in 1834. These tastes were fostered by his intercourse with Sir William Hamilton, which was always most cordial, notwithstanding their wide differences of opinion. Ferrier himself has recorded the warm friendship which subsisted between himself and Hamilton. "For years together," he wrote, "scarcely a day passed in which I was not in his company for hours, and never on this earth may I expect to live such happy hours again." His admiration for his uncle, John Wilson, whose daughter he married, was unbounded, and he had many opportunities of meeting political and literary celebrities in Wilson's house. In 1842 he was appointed professor of civil history in Edinburgh University. In session 1844–45 he acted as Sir William Hamilton's substitute in the chair of logic and metaphysics, and in 1845 he was elected professor of moral philosophy and political economy at St. Andrews. He was twice an unsuccessful candidate for chairs in Edinburgh, for that of moral philosophy on the resignation of Professor Wilson in 1852, and for that of logic and metaphysics in 1856, after Hamilton's death. As a professor Ferrier had immense influence over his students, and was warmly beloved by them. He had an attack of *angina pectoris* in November, 1861, from the effects of which he never recovered. He died on 11th June, 1864.

Ferrier made his début as a metaphysician in a series of articles in *Blackwood* in the years 1838–39, bearing the title "An Introduction to the Philosophy of Consciousness." In these articles he condemns previous philosophers for ignoring in their psychological investigations the fact of consciousness, which is the distinctive feature of man, and confining their observation to the so-called "states of the mind." By doing so, he says, they allowed freedom, will, morality, and all man's peculiar attributes to crumble away It is wrong to apply the method of physical research to the problems of psychology, for the psychologist must *act* or *create* the great phenomenon which he has to observe. Consciousness only comes into manifestation when the man has used the word "I" with full knowledge of what it means. This notion he must originate within himself. Consciousness cannot spring from the states which are its object, for it is in antagonism to them. It originates in the will, which in the act of consciousness puts the "I" in the place of our sensations. Morality, conscience, and responsibility are necessary results of consciousness.

A number of articles on philosophical subjects intervened between the above and the publication of the *Institutes.* The "Crisis of Modern Speculation," contributed in 1841, is a decided advance upon his earlier articles, and evinces a more correct appreciation of the particular element in thought. He there states the problem of philosophy to be the nature of the connection between the mind of man and the external universe, and he solves the question, not by giving it a positive answer, but by changing its aspect. The question as formerly put becomes under his hands meaningless, for mind and universe, subject and object, are shown to be not two, but merely moments in one reality. Think the object, and it becomes subject-object. Think the subject, and it becomes subject-object. So that the question really asked is, "What is the connection between the subjective subject-object and the objective subject-object?" "What is the connection between *one* thing which thought cannot construe as really two?" As results of this mode of stating the question, to which the mere thinking it necessarily leads, perception is removed from the sphere of cause and effect, and the grounds of dogmatic realism and dogmatic idealism are subverted. "Berkeley and Idealism" (1842) is a further exposition of absolute idealism, and contains some foreshadowings of the later teachings of the *Institutes* on the subject of "Agnoiology."

In an article on the publication of Hamilton's edition of Reid (1847), which contains a vigorous attack on the philosophy of common sense, the perception of matter is pronounced to be the *ne plus ultra* of thought, and Reid, for presuming to analyze it, is declared to be a representationist in fact, although he professed to be an intuitionist. A distinction is made between the "perception of matter" and "our apprehension of the perception of matter." Psychology vainly tries to analyze the former. Metaphysic shows the latter alone to be analyzable, and separates the subjective element, "our apprehension," from the objective element, "the perception of matter,"—not matter *per se,* but the perception of matter is the existence independent of the individual's thought. It cannot, however, be independent of thought. It must belong to some mind, and is therefore the property of the Divine Mind. There, he thinks, is an indestructible foundation for the *a priori* argument for the existence of God.

Ferrier's matured philosophical doctrines find expression in the *Institutes of Metaphysics.* Therein he claims to have met the twofold obligation resting on every system of philosophy, that it should be reasoned and true. His method is that of Spinoza, strict demonstration, or at least an attempt at it. All the errors of natural thinking and psychology must fall under one or other of three topics:—Knowing and the Known, Ignorance, and Being. These are all comprehensive, and are therefore the departments into which philosophy is divided; for the sole end of philosophy is to correct the inadvertencies of ordinary thinking. Hence it must be polemical.

The problems of knowing and the known are treated in the "Epistemology or Theory of Knowing," under a series of twenty-two propositions and counter-propositions. Each proposition contains a philosophic truth, and the corresponding counter-proposition expresses the error of ordinary thinking regarding it. The truth that *along with whatever any intelligence knows it must, as the ground or condition of its knowledge, have some cognizance of itself* is the basis of the whole philosophical system; and, variously stated through a series of propositions, it leads to the conclusion that the only independent universe which any mind can think of is the universe in synthesis with some *other* mind or *ego.*

The leading contradiction which is corrected in the "Agnoiology or Theory of Ignorance" is this, that there can be an ignorance of that of which there can be no knowledge. *Ignorance is a defect.* But there is no defect in not knowing what cannot be known by any intelligence, and therefore there can be an ignorance only of that of which there can be a knowledge, *i.e.,* of some-object-*plus*-some-subject. Ferrier lays special claim to originality for this division of the *Institutes.*

The "Ontology or Theory of Being" forms the third and final division of the *Institutes.* It contains a discussion of the origin of knowledge, in which Ferrier traces all the perplexities and errors of philosophers to the assumption of the absolute existence of matter. The conclusion arrived at is that the only true real and independent existences are minds-together-with-that-which-they-apprehend, and that the one strictly necessary absolute existence is a supreme and infinite and everlasting mind in synthesis with all things.

Ferrier's works are perhaps the best propædeutic to the study of metaphysics in the English language. He has Berkeley's charm of style, while he surveys philosophical questions from a more advanced standpoint. His philosophic insight was true from the first. Notwithstanding his disavowal of any indebtedness to the German philosophers, his writings are imbued with the spirit of German metaphysics; and he has the merit of being the first to question the right of Dr. Reid and his school to dominate the thought of Scotland. Others have arisen more potent than he to read the riddle of the great German he admired so much; yet those who seek a knowledge of the philosophy of the absolute will do wisely not to neglect the works of Ferrier.

A collected edition of Ferrier's philosophical works, edited by his son-in-law Sir Alexander Grant, and Professor E. L. Lushington, was published in 1866. This edition contains Ferrier's earlier contributions to *Blackwood,* a few miscellaneous lectures, the biographies of Schelling and Hegel contributed to the *Imperial Dictionary of Universal Biography,* some papers supplementary to the *Institutes of Metaphysics,* and the lectures in Greek philosophy which he delivered to his class. In 1875 there was brought out a three-volume edition of Ferrier's philosophical works, including, along with the above, the *Institutes of Metaphysics,* of which two editions had been published in the author's life-time, one in 1854 and a second in 1856. (D. B.)

FERRIER, SUSAN EDMONSTON (1782-1854), Scottish novelist, born in Edinburgh in 1782, was the aunt of the subject of last notice. Her father was James Ferrier, for some years factor to the duke of Argyll, and at one time one of the clerks of the court of session with Sir Walter Scott. Her mother was a Miss Coutts, the beautiful daughter of a Forfarshire farmer. Miss Ferrier's first novel, *Marriage,* was begun in concert with a friend, Miss Clavering, granddaughter of the duke of Argyll; but this lady soon relinquished her share in the work, and *Marriage,* completed by Miss Ferrier alone, appeared in 1818, when its authoress was between five and six and thirty. It was followed in 1824 by *The Inheritance,* a better constructed and more mature work; and the last and perhaps best of her novels, *Destiny,* dedicated to Sir Walter Scott (who himself undertook to strike the bargain with the publisher Cadell), appeared in 1831. All these novels were published anonymously; but, with their clever portraiture of contemporary Scottish life and manners, and even recognizable caricatures of some social celebrities of the day, they could not fail to become popular north of the Tweed, and many were the conjectures as to their authorship, which was by some attributed to Scott himself. Thus, in the *Noctes Ambrosianæ* (November, 1826), the Shepherd mentions *The Inheritance,* and adds, "which I aye thought was written by Sir Walter, as weel's *Marriage,* till it spunked out that it was written by a leddy." Scott himself gave Miss Ferrier a very high place indeed among the novelists of the day. In his diary (March 27, 1826), criticising a new work which he had been reading, he says, "The women do this better. Edgeworth, Ferrier, Austen, have all given portraits of real society far superior to anything man, vain man, has produced of the like nature." Another friendly recognition of Miss Ferrier is to be found at the conclusion of his *Tales of my Landlord,* where Scott calls her his "sister shadow," the still anonymous author of "the very lively work entitled *Marriage.*"

Lively, indeed, all Miss Ferrier's works are,—written in a clear, brisk English, and with an inexhaustible fund of humor. It is true her books portray the eccentricities, the follies, and foibles of the society in which she lived, caricaturing with terrible exactness its hypocrisy, boastfulness, greed, affectation, and undue subservience to public opinion. Yet Miss Ferrier wrote less to reform than to amuse. With an honest aversion to these things herself, she wished, not to lecture her readers, but to laugh with them. In this she is less like Miss Edgeworth than Miss Austen. Miss Edgeworth was more of a moralist; her wit is not so involuntary, her caricatures not always so good-natured. But Miss Austen and Miss Ferrier were genuine humorists, and with Miss Ferrier especially a keen sense of the ludicrous was always dominant. She could be serious, she could be pathetic, she could even touch some of the finest chords in human nature; but she never interfered with the depths of human wickedness and misery. She liked best to laugh; she turned naturally to the humorous, and her humorous characters are always her best. It was no doubt because she felt this that in the last year of her life she regretted not having devoted her talents more exclusively to the service of religion, not taking into account then how much good she had involuntarily done, and how much harmless pleasure she had distributed about her; for, if she was not a moralist, neither was she a cynic; and her wit, even where it is most caustic, is never uncharitable.

Miss Ferrier lived till 1854, more than twenty years after the publication of her last work. The most pleasant picture that we have of her is in Lockhart's description of her visit to Scott in May, 1831. She was asked there to help to amuse the dying master of Abbotsford, who, when he was not writing *Count Robert of Paris*, would talk as brilliantly as ever. Only sometimes, before he had reached the point in a narrative, "it would seem as if some internal spring had given way." He would pause, and gaze blankly and anxiously round him. "I noticed," says Lockhart, "the delicacy of Miss Ferrier on such occasions. Her sight was bad, and she took care not to use her glasses when he was speaking; and she affected to be also troubled with deafness, and would say, 'Well, I am getting as dull as a post; I have not heard a word since you said so-and-so,'—being sure to mention a circumstance behind that at which he had really halted. He then took up the thread with his habitual smile of courtesy—as if forgetting his case entirely in the consideration of the lady's infirmity."

Miss Ferrier died, November 5, 1854, at her house No. 38 Albany Street, Edinburgh. She left among her papers a short unpublished article, entitled "Recollections of Visits to Ashestiel and Abbotsford." This is her own very interesting account of her long friendship with Sir Walter Scott, from the date of her first visit to him and Lady Scott at Ashestiel, where she went with her father in the autumn of 1811, to her last sad visit to Abbotsford in 1831. It contains some impromptu verses written by Scott in her album at Ashestiel.

FERRO, or HIERRO. See CANARY ISLANDS, vol. iv. p. 706.

FERROL, a seaport town of Spain, province of Coruña, is situated on the northern arm of the bay of Belanzos, 12 miles N.E. of Coruña. The town is divided into three parts, the old, the new, and the "esteiro." The old town is very irregular, but the new town is a parallelogram of seven streets in width, by nine in length, intersecting each other at right angles. It has two squares, in one of which is a fountain, erected in 1812 in honor of Cosme Churruca, a naval officer killed at Trafalgar. Ferrol is invisible from the sea, and is so strongly fortified that it is considered impregnable. Its arsenal is one of the three largest in the kingdom, and along with the wharves and dockyards exceeds 23 acres in extent. The dockyard is divided into a smaller outward and a larger inward portion. Behind the inner dock are the dwellings of the operatives, and in the north angle are the foundries, ropeworks, and magazines. On the dockyard 15 ships of the line can be built at one time. Connected with the arsenal is a school for engineering, and also a marine observatory. The harbor, which is one of the best in Europe, is deep, capacious, and secure; but the entrance, which is a strait about two miles in length, admits at the narrowest part only one ship at a time, and is commanded by forts Palma and San Felipe on opposite sides. The chief industries of the town are rope-making, sail-making, and the manufacture of leather. It contains two hospitals, three large churches, a monastery, a consistory, a prison, and a naval barracks with accommodation for 6000 men. The population in 1860 was 21,120.

Until 1752 Ferrol was a mere fishing village, but in that year Ferdinand VI. began to fit it for becoming an arsenal. In 1799 the English made a fruitless attempt to capture it, but on the 4th November, 1805, they defeated the French fleet in front of it and compelled its surrender. On the 27th January, 1809, it was through treachery delivered over to the French, but it was vacated by them on the 22d July of the same year. On the 15th July, 1823, another blockade was begun by the French, and it surrendered to them on the 27th August.

FERRY, in the law of England, is the right of carrying by boat across a river or arm of the sea, and of exacting a reasonable toll for such carriage. It belongs, like the right of fair and market, to the class of rights called in English law franchises. It origin must be by statute, royal grant, or prescription. It is wholly unconnected with the ownership or occupation of land, so that the owner of the ferry need not be proprietor of the soil on either side of the water over which the right is exercised. He is bound to maintain safe and suitable boats ready for the use of the public, and to employ fit persons as ferrymen. As a correlative of this duty he has a right of action, not only against those who evade or refuse payment of toll when it is due, but against those also who disturb his franchise by setting up a new ferry, so as to diminish his custom. In Scotland the law is similar. There ferries are either public or private. Public ferries are under the management of the trustees of the roads connected with them, or of the justices of the peace of the county, or are regulated by special Acts of Parliament. Private ferries are those which have been granted by the crown to private individuals. They are acquired either by direct grant or by prescription. A new ferry calculated to affect the old one injuriously is illegal in Scotland as in England. A neighboring proprietor may make use of his boats to transport himself, his family, servants, visitors, and workmen, but he may not carry other persons, even gratuitously.

FERSEN, AXEL, COUNT (1755–1810), marshal of the kingdom of Sweden, was born at Stockholm, September 4, 1755. He belonged to an old Livonian family, several members of which had attained distinction during the reigns of Queen Christina, Charles X., and Charles XI. He was educated by his father Count Axel, a senator of Sweden under Gustavus III., and afterward studied at the military academy of Turin. In 1775 he returned to Sweden and entered the army. Four years later he went to France, and was appointed colonel of the royal regiment of Swedes in the service of Louis XVI. At the head of this regiment he served with distinction in the later campaigns of the American war, and was aide-de-camp to General Rochambeau at Yorktown. After visiting England and Italy he returned to France, and on the outbreak of the Revolution he showed himself the devoted friend of the royal family. When their flight from Paris was arranged, Count Fersen consented to play the part of coachman in disguise; and he conducted them to the post of Bondi, whence they were sent on under other care. After the failure of the scheme and the imprisonment of the royal family, he zealously exerted himself to minister in any way possible to their comfort and relief. Compelled to leave France after the execution of the king and queen, he visited Vienna, Dresden, and Berlin, and then returned to Sweden. He was named by the king grand-master of his household, chancellor of the university of Upsala, and marshal of the kingdom. He was soon after sent as plenipotentiary to the congress of Rastadt. But he was at the same time disliked and suspected by the people, and when the crown prince, Christian of Augustenburg, suddenly died, in June, 1810, suspicions fastened on him and his sister the Countess Piper of having taken part with others in poisoning the prince. At the funeral they were assailed by the crowd; the marshal sought refuge in a house, but was slain by the mob, and his body exposed in the great square (June 20, 1810). His sister succeeded in making her escape. The complete innocence of Count Fersen and his family was established by a subsequent judicial investigation.

FESCA, FREDERIC ERNEST (1789–1826), violinist and composer of instrumental music, was born February 15, 1789, at Magdeburg, where he received his early musical education from Lohse and Zachariä. He completed his studies at Leipsic under Eberhard Müller, and at the early age of fifteen appeared before the public with several concerti for the violin, which were received with general applause, and resulted in his being appointed leading violinist of the Leipsic orchestra. This position he occupied till 1806, when he became concert-master to the duke of Oldenburg. In 1808 he was appointed solo-violinist by King Jerome of Westphalia at Cassel, and there he remained till the end of the French occupation (1814), when he went to Vienna, and soon afterwards to Carlsruhe, having been appointed concert-master to the grand-duke of Baden. His failing health prevented him from enjoying the numerous and well-deserved triumphs he owed to his art, and in 1826 he died of consumption at the early age of thirty-seven. As a virtuoso Fesca is amongst the best masters of the German school of violinists, the school subsequently of Spohr and of Joachim. Especially as leader of a quartet he is said to have been unrivalled with regard to classic dignity and simplicity of style. Amongst his compositions, his quartets for stringed instruments and other pieces of chamber music are the most remarkable. His two operas, *Cantemira* and *Omar and Leila*, were less successful, lacking dramatic power and originality. He also wrote some sacred compositions, and numerous songs and vocal quartets.

FESCH, JOSEPH (1763–1839), cardinal, archbishop of Lyons, was born at Ajaccio, in Corsica, January 3, 1763, six years before the island was conquered by the French. His father, Francis Fesch, of Basel, was a Swiss officer in the service of Genoa, who had married as his second wife a young widow, the mother of Letizia Bonaparte. Joseph Fesch was thus half-brother to Letizia, and uncle to her son Napoleon Bonaparte. He was educated at the seminary of Aix in Provence, took holy orders, and became archdeacon and provost of the chapter of Ajaccio. When the French Revolution broke out, and the chapters were suppressed, Fesch protested against the civil constitution of the clergy, and laid aside his clerical dress. In 1793 he had to quit Corsica, followed the Bonapartes to Toulon, and obtained a post in the army administration. In 1795 he was named commissary of war in the army of Italy, of which his nephew Napoleon Bonaparte became commander-in-chief. After the 18th Brumaire (November 9, 1799) he resumed his ecclesiastical functions, and took part in the negotiations which led up to the concordat of 1801. In the following year he was consecrated archbishop of Lyons, and early in 1803 received a cardinal's hat. Napoleon having been proclaimed emperor, and desiring to be crowned at Paris by the pope, Cardinal Fesch was sent as ambassador to Rome to treat with Pius VII. respecting this project. He was received with much distinction, won the pope's good opinion, and brought the negotiations to a successful issue. On this occasion the cardinal had for his secretary the viscount de Chateaubriand, who had just made himself famous by the publication of his *Génie du Christianisme.* The association, however, was not a happy one. Cardinal Fesch accompanied Pius VII. to Paris, and took part in all the ceremonies of the coronation of his uncle. In reward for his services at Rome he was made grand-almoner of France, grand-cordon of the Legion of Honor, and senator. In 1806 he was chosen coadjutor and successor of Dalberg, prince-primate of the confederation of the Rhine, and arch-chancellor of the empire, and received a large annual subvention. The dissensions which continued between Napoleon and the holy see made the cardinal's position a very difficult one; but he resisted the violent measures taken by the emperor against the pope; and when, in 1809, the emperor desired to have one of his kindred head of the French church, and offered to Fesch the archbishopric of Paris, he declined the offer. He refused even to accept the administration of the diocese. As president of the national ecclesiastical council held at Paris in 1810, he boldly put forward views which gave offence to the emperor and lost him his favor. He was sent back to his diocese, and in consequence of his letter to the pope, then at Fontainebleau, he was deprived of his subvention. In 1814 he withdrew to Rome, but returned to France and his see during the Hundred Days. He was created a peer, but never sat in the chamber. After Waterloo he returned to Rome, and there spent the remaining years of his life in the enjoyment of his vast wealth and his accumulated art-treasures. He died at Rome, May 13, 1839. His correspondence with Napoleon was published by Du Casse in 1855.

FESSLER, IGNAZ AURELIUS (1756–1839), a celebrated Hungarian ecclesiastic, historian, and freemason, was born on the 18th May, 1756, at the village of Zurány in the county of Moson. His mother, who was a pious Roman Catholic, made every effort to secure for him a strict religious education. On the 9th July, 1773, he joined the order of Capuchins as a novice, and in the following year he took the monastic vows, assuming the name of Innocentius. After living in disagreement with his superiors in different monasteries he was transferred to the Capuchin house at Vienna; and while there, by means of a private letter, he drew the attention of the emperor Joseph II. to the irregularities of the monasteries. The searching investigation which followed raised up against him many implacable enemies. Released from the monastery by an imperial decree, he was in 1784 appointed professor of Oriental languages and hermeneutics in the university of Lemberg. In 1787 he brought out his tragedy of *Sidney*, which his enemies attacked so violently as profane and revolutionary that they compelled him to resign his office and seek refuge in Silesia. In Breslau he met with a cordial reception from Korn the publisher, and was, moreover, subsequently employed by the prince of Carolath as tutor to his sons. In 1791 Fessler was converted to Protestantism, and in 1796 he went to Berlin, where he founded a humanitarian society, and was commissioned by the freemasons of that city to assist Fichte in reforming the statutes and ritual of their lodge. He soon after this obtained a Government appointment in connection with the newly-acquired Polish provinces, but in consequence of the battle of Jena (1806) he lost this office, and remained in very needy circumstances until 1809, when he was summoned to St. Petersburg by Alexander I., to fill the post of court councillor and the professorship of Oriental languages and philosophy at the Alexander-Newski Academy. This office, however, he was soon obliged to resign, owing to his alleged atheistic tendencies, but he was subsequently nominated a member of the legislative commission. In 1815 he was deprived of his salary, but it was restored to him in 1817. In November, 1819, he was appointed consistorial president of the Protestant communities at Saratov, and subsequently became chief superintendent of the Lutheran communities in St. Petersburg. Fessler's numerous works are all written in German. In recognition of his important services to Hungary as an historian, he was in 1831 elected a corresponding member of the Hungarian Academy of Sciences. He died at St. Petersburg, December 15, 1839, in the 84th year of his age. His most important works are—*Die Geschichten der Ungarn und ihrer Landsassen*, 10 vols., Leipsic, 1815–25; *Marcus Aurelius*, 3 vols., Breslau, 1790–92 (3d edition, 4 vols., 1799); *Aristides und Themistokles*, 2 vols., Berlin, 1792 (3d edition, 1818); *Attila, König der Hunnen*, Breslau, 1794; *Mathias Corvinus*, 2 vols., Breslau, 1793–94; and *Dei drei grossen Könige der Hungarn aus dem Arpadischen Stamme*, Breslau, 1808.

See Fessler's *Rückblicke auf seine siebzigjährige Pilgerschaft*, Breslau, 1824 (2d edition, Leipsic, 1851).

FESTIVALS. A festival or feast[1] is a day or series of days specially and publicly set apart for religious observances. Whether its occurrence be casual or periodic, whether its ritual be grave or gay, carnal as the orgies of Baal and Astarte or spiritual as the worship of a Puritan Sabbath, it is to be regarded as a festival or "holy day" as long as it is professedly held in the name of religion.

To trace the festivals of the world through all their variations would be to trace the entire history of human religion and human civilization. Where no religion is, there can of course be no feasts; and without civilization any attempt at festival-keeping must necessarily be fitful and comparatively futile. But as religion develops, festivals develop with it, and assume their distinctive character; and an advancing civilization, at least in its earlier stages, will generally be found to increase their number, enrich their ritual, fix more precisely the time and order of their recurrence, and widen the area of their observance.

Some uncivilized tribes, such as the Juángs of Bengal, the Fuegians, and the Andamanese, have been described as having no word for God, no idea of a future state, and consequently no religious ceremonies of any kind whatever. But such cases, doubtful at the best, are confessedly exceptional. In the vast majority of instances observed and recorded, the religiosity of the savage is conspicuous. Even when incapable of higher manifestations, it can at least take the form of reverence for the dead; the grave-heap can become an altar on which offerings of food for the departed may be placed, and where in acts of public and private worship the gifts of survivors may be accompanied with praises and with prayers. That the custom of ghost-propitiation by some sort of sacrifice is even now very widely diffused among the lower races at least, and that there are also many curious "survivals" of such a habit to be traced among highly civilized modern nations, has been abundantly shown of late by numerous collectors of folk-lore and students of sociology; and indications of the same phenomena can be readily pointed out in the Rig-Veda, the Zend-Avesta, and the Pentateuch, as well as in the known usages of the ancient Egyptians, Greeks, and Romans.[1] In many cases the ceremonial observed is of the simplest; but it ever tends to become more elaborate; and above all it calls for repetition, and repetition, too, at regular intervals. Whenever this last demand has made itself felt, a calendar begins to take shape. The simplest calendar is obviously the lunar. "The Naga tribes of Assam celebrate their funeral feasts month by month, laying food and drink on the graves of the departed." But it soon comes to be combined with the solar. Thus the Karens, "while habitually making oblations, have also annual feasts for the dead, at which they ask the spirits to eat and drink." The natives of the Mexican valley in November lay animals, edibles, and flowers on the graves of their dead relatives and friends. The common people in China have a similar custom on the arrival of the winter solstice. The ancient Peruvians had the custom of periodically assembling the embalmed bodies of their dead emperors in the great square of the capital to be feasted in company with the people. The Athenians had their annual Νεκύσια or Νεμέσεια, and the Romans their *Feralia* and *Lemuralia*. The Egyptians observed their three "festivals of the seasons," twelve "festivals of the month," and twelve "festivals of the half month," in honor of their dead. The Parsees, too, were required to render their afringans (blessings which were to be recited over a meal to which an angel or the spirit of a deceased person was invited) at each of the six seasons of the year, and also on certain other days.[2]

---

[1] "To feast" is simply to keep a festum or festival. The etymology of the word is uncertain; but probably it has no connection with ἑστιᾶν.

In the majority of recorded instances, the religious feeling of the savage has been found to express itself in other forms besides that of reverence towards the dead. The oldest literatures of the world, at all events, whether Aryan or Semitic, embody a religion of a much higher type than ancestor worship. The hymns of the Rig-Veda, for example, while not without traces of the other, yet indicate chiefly a worship of the powers of nature, connected with the regular recurrence of the seasons. Thus in iv. 57 we have a hymn designed for use at the commencement of the ploughing time;[3] and in the *Aitareya-Brâhmana*, the earliest treatise on Hindu ceremonial, we already find a complete series of sattras or sacrificial sessions exactly following the course of the solar year. They are divided into two distinct sections, each consisting of six months of thirty days each. The sacrifices are allowed to commence only at certain lucky constellations and in certain months. So, for instance, as a rule, no great sacrifice can commence during the sun's southern progress. The great sacrifices generally take place in spring, in the months of April and May.[4] In the Parsee Scriptures[5] the year is divided into six seasons or gahanbârs of two months each, concluding with February, the season at which "great expiatory sacrifices were offered for the growth of the whole creation in the last two months of the year." We have no means of knowing precisely what were the arrangements of the Phœnician calendar, but it is generally admitted that the worship was solar, the principal festivals taking place in spring and in autumn. Among the most characteristic celebrations of the Egyptians were those which took place at the *ἀφανισμός* or disappearance of Osiris in October or November, at the search for his remains, and their discovery about the winter solstice, and at the date of his supposed entrance into the moon at the beginning of spring. The Phrygian festivals were also arranged on the theory that the deity was asleep during the winter and awake during the summer; in the autumn they celebrated his retiring to rest, and in spring with mirth and revelry they roused him from his slumbers.[6] The seasonal character of the Teutonic Ostern, the Celtic Beltein, and the Scandinavian Yule is obvious. Nor was the habit of observing such festivals peculiar to the Aryan or the Semitic race. The Mexicans, who were remarkable for the perfection of their calendar (see vol. i. 610), had also an elaborate system of movable and immovable feasts distributed over the entire year; the principal festivals, however, in honor of their chiefs gods, Tezcatlipoca, Huitzilopochtli, and Tlaloc, were held in May, June, and December. Still more plainly connected with the revolutions of the seasons was the public worship of the ancient Peruvians, who, besides the ordinary feast at each new moon, observed four solar festivals annually. Of these the most important was the Yntip-Raymi (Sun-feast), which, preceded by a three days' fast, began with the summer solstice, and lasted for nine days. Its ceremonies have been often described. A similar but less important festival was held at the winter solstice. The Cusqui-Raymi, held after seed-time, as the maize began to appear, was celebrated with sacrifices and banquets, music and dancing. A fourth great festival, called Citua, held on the first new moon after the autumnal equinox, was preceded by a strict fast and special observances intended for purposes of purification and expiation, after which the festivities lasted until the moon entered her second quarter.

Greek Festivals.—Perhaps the annual Attic festival in honor of Erechtheus alluded to in the *Iliad* (ii. 550) ought to be regarded as an instance of ancestor-worship; but the seasonal character of the *ἑορτή* or new-moon feast in *Od.*, xx. 156, and of the *θαλύσια* or harvest-festival in *Il.*, ix. 533, is generally acknowledged. The older Homeric poems, however, give no such express indications of a fully-developed system of festivals as are to be met with in the so-called "Homeric" hymns, in the *Works and Days* of Hesiod, in the pages of Herodotus, and so abundantly in most authors of the subsequent period; and it is manifest that the calendar of Homer or even of Herodotus must have been a much simpler matter than that of the Tarentines, for example, came to be, of whom we are told by Strabo that their holidays were in excess of their working days. Each demos of ancient Greece during the historical period had its own local festivals (*ἑορταὶ δημοτικαί*), often largely attended and splendidly solemnized, the usages of which, though essentially alike, differed very considerably in details. These details have in many cases been wholly lost, and in others have reached us only in a very fragmentary state. But with regard to the Athenian calendar, the most interesting of all, our means of information are fortunately very copious. It included some 50 or 60 days on which all business, and especially the administration of justice, was by order of the magistrates suspended. Among these *ἱερομηνίαι* were included—in Gamelion (January), the *Lenœa* or wine-press feast in honor of Dionysus; in Anthesterion (February), the *Anthesteria*, also in honor of Dionysus, lasting three days (Pithoigia, Choes, and Chutroi); the *Diasia* in honor of Zeus, and the lesser *Eleusinia*; in Elaphebolion (March), the *Pandia* of Zeus, the *Elaphebolia* of Artemis, and the greater *Dionysia*; in Munychion, the *Munychia* of Artemis as the moon goddess (Μουνυχία) and the *Delphinia* of Apollo; in Thargelion (May), the *Thargelia* of Apollo and the *Plynteria* and *Callynteria* of Athene; in Skirophorion (June), the *Diipolia* of Zeus and the *Skirophoria* of Athene; in Hekatombaion hecatombs were offered to Apollo the summer-god, and the *Cronia* of Cronus and the *Panathenœa* of Athene were held; in Metageitnion, the *Metageitnia* of Apollo; in Boedromion, the *Boedromia* of Apollo the helper,[7] the *Nekusia* or *Nemeseia* (the festival of the dead), and the greater *Eleusinia*; in Pyanepsion, the *Pyanepsia* of Apollo, the *Oschophoria* of Dionysus (probably), the *Chalkeia* or *Athenœa* of Athene, the *Thesmophoria* of Demeter, and the *Apaturia*; in Maimakterion, the *Maimakteria* of Zeus; and in Poseideon (December), the lesser *Dionysia*.

Of these (for the more important of which reference is made to the separate articles) some are commemorative of historical events, and one at least may perhaps be regarded as a relic of ancestor-worship; but the great majority are nature-festivals, associating themselves in the manner that has already been indicated with the phenomena of the seasons, the equinoxes, and the solstices.[1] In addition to their numerous public festivals, the Greeks held various family celebrations, also called ἑορταί, in connection with weddings, births, and similar domestic occurrences. The great national πανηγύρεις—Olympian, Pythian, Nemean, and Isthmian—will be found under separate headings.

[7] In this month the anniversaries of the battle of Marathon, and of the downfall of the thirty tyrants, were also publicly celebrated.

Roman Festivals.—For the purpose of holding comitia and administering justice, the days of the Roman year were regarded as being either dies fasti or dies nefasti—the dies fasti being the days on which it was lawful for the prætors to administer justice in the public courts, while on the dies nefasti neither courts of justice nor meetings of comitia were allowed to be held. Some days were fasti during one portion and nefasti during another; these were called dies intercisi. For the purposes of religion a different division of the year was made; the days were treated as festi or as profesti,—the former being consecrated to acts of public worship, such as sacrifices, banquets, and games, while the latter (whether fasti or nefasti) were not specially claimed for religious purposes. The dies festi or feriæ publicæ[2] were either stativæ, conceptivæ, or imperativæ. The stativæ were such as were observed regularly, each on a definite day; the conceptivæ were observed annually on days fixed by the authorities for the time being; the imperativæ were publicly appointed as occasion called for them. In the Augustan age the feriæ stativæ were very numerous, as may be seen from what we possess of the *Fasti* of Ovid. The number was somewhat fluctuating. Festivals frequently fell into desuetude or were revived, were increased or diminished, were shortened or prolonged at the will of the emperor, or under the caprice of the popular taste. Thus Augustus restored the Compitalia and Lupercalia; while Marcus Antoninus in his turn found it expedient to diminish the number of holidays.

The following is an enumeration of the stated festivals as given by Ovid and contemporary writers. The first day of January was observed somewhat as is the modern New Year's Day: clients sent presents to their patrons, slaves to their masters, friends and relations to one another. On the 9th the *Agonalia* were held, apparently in honor of Janus. On the 11th the *Carmentalia* were kept as a half-holiday, but principally by women; so also on the 15th. On the 13th of February were the *Faunalia*, on the 15th the *Lupercalia*, on the 17th the *Quirinalia*, on the 18th the *Feralia*, on the 23d (at one time the last day of the Roman year) the *Terminalia*, on the 24th the *Regifugium* or *Fugalia*, and on the 27th the *Equiria* (of Mars). On the 1st of March were the *Matronalia*, on the 14th a repetition of the *Equiria*, on the 15th the festival of Anna Perenna, on the 17th the *Liberalia* or *Agonalia*, and from the 19th to the 23d the *Quinquatria* (of Minerva). On the 4th of April were the *Megalesia* (of Cybele), on the 12th the *Cerealia*, on the 21st the *Palilia*, on the 23d the *Vinalia*, on the 25th the *Robigalia*, and on the 28th the *Floralia*. The 1st of May was the festival of the Lares Præstites; on the 9th, 11th, and 13th the *Lemuria* were celebrated; on the 12th the *Ludi Martiales*, and on the 15th those of Mercury. June 5 was sacred to Semo Sancus; the *Vestalia* occurred on the 9th, the *Matralia* on the 11th, and the *Quinquatrus Minusculæ* on the 13th. The *Ludi Apollinares* were on the 5th, and the *Neptunalia* on the 23d of July. On the 13th of August were the *Nemoralia*, in honor of Diana; on the 18th the *Consualia*, on the 19th the *Vinalia Rustica*, and on the 23d the *Vulcanalia*. The *Ludi Magni*, in honor of Jupiter, Juno, and Minerva, began on September 4. The *Meditrinalia* (new wine) were on the 11th of October, the *Faunalia* on the 13th, and the *Equiria* on the 15th. The *Epulum Jovis* was on 13th November. The December festivals were—on the 5th *Faunalia*, and towards the close *Opalia*, *Saturnalia*, *Larentalia*.

The calendar as it stood at the Augustan age was known to contain many comparatively recent accessions brought in under the influence of two "closely allied powers, the foreign priest and the foreign cook" (Mommsen). The Megalesia, for example, had been introduced 204 B.C. The Ludi Apollinares could not be traced further back than 208 B.C. The Floralia and Cerealia had not come in much earlier. Among the oldest feasts were undoubtedly the Lupercalia, in honor of Lupercus, the god of fertility; the Equiria, in honor of Mars; the Palilia; the great September festival; and the Saturnalia.

Among the feriæ conceptivæ were the very ancient feriæ Latinæ, held in honor of Jupiter on the Alban Mount, and attended by all the higher magistrates and the whole body of the senate. The time of their celebration greatly depended on the state of affairs at Rome, as the consuls were not allowed to take the field until they had held the Latinæ, which were regarded as days of a sacred truce. The feriæ sementivæ were held in the spring, and the Ambarvalia in autumn, both in honor of Ceres. The Paganalia of each pagus and the Compitalia of each vicus were also conceptivæ. Of feriæ imperativæ,—that is to say, festivals appointed by the senate, or magistrates, or higher priests to commemorate some great event or avert some threatened disaster,—the best known is the Novendiale, which used to be celebrated as often as stones fell from heaven (Livy, xxi. 62, xxv. 7, etc.). In addition to all those already mentioned, there occasionally occurred ludi votivi, which were celebrated in fulfilment of a vow; ludi funebres, sometimes given by private persons; and ludi seculares, to celebrate certain periods marked off in the Etrusco-Roman religion.

Feasts of the Jews.—By Old Testament writers a festival or feast is generally called either חַג (compare the Arabic Hadj), from חָגַג, to rejoice or מוֹעֵד, from יָעַד, to appoint. The words שַׁבָּת and מִקְרָא קֹדֶשׁ are also occasionally used. In the Talmud the three principal feasts are called רְגָלִים, after Exod. xxiii. 14. Of the Jewish feasts which are usually traced to a pre-Mosaic origin the most important and characteristic was the weekly Sabbath, but special importance was also attached from a very early date to the lunar periods. It is probable that other festivals also, of a seasonal character, were observed (see Exod. v. 1). In common with most others, the Mosaic system of annual feasts groups itself readily around the vernal and autumnal equinoxes. In Lev. xxiii., where the list is most fully given, they seem to be arranged with a conscious reference to the sacred number seven (compare Numb. xxviii.). Those belonging to the vernal equinox are three in number; a preparatory day, that of the Passover, leads up to the principal festival, that of unleavened bread, which again is followed by an after-feast, that of Pentecost (see PASSOVER, PENTECOST). Those of the autumnal equinox are four; a preparatory day on the new moon of the seventh month (the Feast of Trumpets) is followed by a great day of rest, the day of Atonement (which, however, was hardly a *festival* in the stricter sense of the word), by the feast of Tabernacles, and by a great concluding day (Lev. xxiii. 36; John vii. 37). If the feast of the Passover be excepted, it will be seen that all these celebrations or commemorations associate themselves more readily with natural than with historical events.[3] There was also a considerable number of post-Mosaic festivals, of which the principal were that of the Dedication (described in 1 Macc. iv. 52–59; comp. John x. 22) and that of Purim, the origin of which is given in the book of Esther (ix. 20 *sq.*). It has probably no connection with the Persian festival Furdegán (see ESTHER)[4].

Earlier Christian Festivals.—While making it abundantly manifest that Christ and His disciples observed the appointed Jewish feasts, the New Testament nowhere records the formal institution of any distinctively Christian festival. But we have unambiguous evidence of the actual observance, from a very early period, of the first day of the week as a holy day (John xx. 19, 26; 1 Cor. xvi. 2; Acts xx. 7; Rev. i. 10). Pliny in his letter to Trajan describes the Christians of Bithynia as meeting for religious purposes on a set day; that this day was Sunday is put beyond all reasonable doubt by such a passage as that in the *Apology* of Justin Martyr, where he says that "on Sunday (τῇ τοῦ ἡλίου λεγομένῃ ἡμέρᾳ) all the Christians living either in the city or the country met together." The Jewish element, in some churches at least, and especially in the East, was strong enough to secure that, along with the *dies dominica*, the seventh day should continue to be kept holy. Thus in the *Apostolic Constitutions* (ii. 59) we find the Saturday specially mentioned along with the Sunday as a day for the assembling of the church; in v. 15 it is ordained that there shall be no fasting on Saturday, while in viii. 33 it is added that both on Saturday and Sunday slaves are to have rest from their labors. The 16th canon of the council of Laodicea almost certainly means that solemn public service was to be held on Saturday as well as on Sunday. In other quarters, however, the tendency to regard both days as equally sacred met with considerable resistance. The 36th canon of the council of Illiberis, for example, deciding that Saturday should be observed as a fast-day, was doubtless intended to enforce the distinction between Saturday and Sunday. At Milan in Ambrose's time Saturday was observed as a festival; but Pope Innocent is found writing to the bishop of Eugubium to urge that it should be kept as a fast. Ultimately the Christian church came to recognize but one weekly festival.

---

[1] See Schoemann, *Griechische Alterthümer*, ii. 439 sq.; Mommsen, *Heortologie*.

[2] Feriæ privatæ, such as anniversaries of births, deaths, and the like, were observed by separate clans, families, or individuals.

[3] In the "parallel" passages, there is considerable variety in the designation and arrangement of these feasts. While Ex. xii. approximates most closely to Lev. xxiii. and Num. xxviii., Ex. xxiii. has stronger affinities with Deut. xvi. The relations of these passages are largely discussed by Graf, *Die Geschichtlichen Bücher des A. T.*, pp. 34–41, and by other recent critics.

[4] On the whole subject of Jewish festivals see Reland, *Antiq. Hebr.*; Knobel, *Leviticus* (c. 23); George, *Die Jüdischen Feste*; Hupfeld, *De primitiva fest. ap. Hebr. ratione*; Ewald, *Alterthümer des Volkes Israel*; Dillmann in Schenkel's *Bibel-lexicon*, art. "Feste."

The numerous yearly festivals of the later Christian church, when historically investigated, can be traced to very small beginnings. Indeed, while it appears to be tolerably certain that Jewish Christians for the most part retained all the festivals which had been instituted under the old dispensation, it is not at all probable that either they or their Gentile brethren recognized any yearly feasts as of distinctively Christian origin or obligation. It cannot be doubted, however, that gradually, in the course of the 2d century, the universal church came to observe the anniversaries of the death and resurrection of Christ—the *πάσχα σταυρώσιμον* and the *πάσχα ἀναστάσιμον*, as they were respectively called (see EASTER and GOOD FRIDAY). Not long afterwards Whitsunday also came to be fixed in the usage of Christendom as a great annual festival. Even Origen (in the 8th book *Against Celsus*) enumerates as Christian festivals the Sunday, the *παρασκευή*, the Passover with the feast of the Resurrection, and Pentecost; under which latter term, however, he includes the whole period between Easter and Whitsuntide. About Cyprian's time we find individual Christians commemorating their departed friends, and whole churches commemorating their martyrs; in particular, there are traces of a local and partial observance of the feast of the Innocents. Christmas day and Epiphany were among the later introductions, the feast of the Epiphany being somewhat the earlier of the two. Both are alluded to indeed by Clemens Alexandrinus (i. 340), but only in a way which indicates that even in his time the precise date of Christ's birth was unknown, that its anniversary was not usually observed, and that the day of his baptism was kept as a festival only by the followers of Basilides (see EPIPHANY).

When we come down to the 4th century we find that, among the 50 days between Easter and Pentecost, Ascension day has come into new prominence. Augustine, for example, enumerates as anniversaries celebrated by the whole church those of Christ's passion, resurrection, and ascension, along with that of the outpouring of the Holy Ghost, while he is silent with regard to Christmas and Epiphany. The general tendency of this and the following centuries was largely to increase the festivals of the church, and by legislation to make them more fixed and uniform. Many passages, indeed, could be quoted from Chrysostom, Jerome, and Augustine to show that these fathers had not by any means forgotten that comparative freedom with regard to outward observances was one of the distinctive excellences of Christianity as contrasted with Judaism and the various heathen systems (compare Socrates, *H. E.*, v. 22). But there were many special circumstances which seemed to the leaders of the Church at that time to necessitate the permission and even legislative sanction of a large number of new feasts. The innovations of heretics sometimes seemed to call for rectification by the institution of more orthodox observances; in other instances the propensity of rude and uneducated converts from paganism to cling to the festal rites of their forefathers proved to be invincible, so that it was seen to be necessary to seek to adapt the old usages to the new worship rather than to abolish them altogether;[1] moreover, although the empire had become Christian, it was manifestly expedient that the old holidays should be recognized as much as possible in the new arrangements of the calendar. Constantine soon after his conversion enacted that on the *dies dominica* there should be no suits or trials in law; Theodosius the Great added a prohibition of all public shows on that day, and Theodosius the younger extended the prohibition to Epiphany and the anniversaries of martyrdoms, which at that time included the festivals of St. Stephen, and of St. Peter and St. Paul, as also that of the Maccabees. In the 21st canon of the council of Agde (506), besides Easter, Christmas, Epiphany, Ascension, and Pentecost, we find the Nativity of John the Baptist already mentioned as one of the more important festivals on which attendance at church was regarded as obligatory. To these were added, in the centuries immediately following, the feasts of the Annunciation, the Purification, and the Assumption of the Virgin; as well as those of the Circumcision, of St. Michael, and of All Saints.

Festivals were in practice distinguished from ordinary days in the following ways:—all public and judicial business was suspended,[2] as well as every kind of game or amusement which might interfere with devotion; the churches were specially decorated; Christians were expected to attend public worship, attired in their best dress; love feasts were celebrated, and the rich were accustomed to show special kindness to the poor; fasting was strictly forbidden, and public prayers were said in a standing posture.

Later Practice.—In the present calendar of the Roman Catholic Church the number of feast days is very large. Each is celebrated by an appropriate office, which, according to its character, is either duplex, semi-duplex, or simplex. A duplex again may be either of the first class or of the second, or a major or a minor. The distinctions of ritual for each of these are given with great minuteness in the general rubrics of the breviary; they turn chiefly on the number of Psalms to be sung and of lessons to be read, on the manner in which the antiphons are to be given, and on similar details. The duplicia of the first class are the Nativity, the Epiphany, Easter with the three preceding and two following days, the Ascension, Whitsunday and the two following days, Corpus Christi, the Nativity of John Baptist, Saints Peter and Paul, the Assumption of the Virgin, All Saints, and, for each church, the feast proper to its patron or title and the feast of its dedication. The duplicia of the second class are the Circumcision, the feast of the Holy Name of Jesus, of the Holy Trinity, and of the Most Precious Blood of Christ, the feasts of the Purification, Annunciation, Visitation, Nativity, and Conception of the Virgin, the Natalitia of the Twelve Apostles, the feasts of the Evangelists, of St. Stephen, of the Holy Innocents, of St. Joseph and of the Patrocinium of Joseph, of St. Lawrence, of the Invention of the Cross, and of the Dedication of St. Michael. The Dominicæ majores of the first class are the first Sunday in Advent, the first in Lent, Passion Sunday, Palm Sunday, Easter Sunday, Dominica in Albis, Whitsunday, and Trinity Sunday; the Dominicæ majores of the second class are the second, third, and fourth in Advent, Septuagesima, Sexagesima, and Quinquagesima Sundays, and the second, third, and fourth Sundays in Lent.

In the canons and decrees of the council of Trent repeated allusions are made to the feast days, and their fitness, when properly observed, to promote piety. Those entrusted with the cure of souls are urged to see that the feasts of the church be devoutly and religiously observed, the faithful are enjoined to attend public worship on Sundays and on the greater festivals at least, and parish priests are bidden to expound to the people on such days some of the things which have been read in the office for the day. Since the council of Trent, the practice of the church with respect to the prohibition of servile work on holidays has varied considerably in different Catholic countries, and even in the same country at different times. Thus in 1577, in the diocese of Lyons, there were almost 40 annual festivals of a compulsory character. By the concordat of 1802 the number of such festivals was for France reduced to four, namely, Christmas day, Ascension day, the Assumption of the Virgin, and All Saints' day.

The calendar of the Greek Church is even fuller than that of the Latin, especially as regards the *ἑορταὶ τῶν ἁγιῶν*. Thus on the last Sunday in Advent the feast of All Saints of the Old Covenant is celebrated; while Adam and Eve, Job, Elijah, Isaiah, etc., have separate days. The distinctions of ritual are analogous to those in the Western Church. In the Coptic Church there are seven great festivals, Christmas, Epiphany, the Annunciation, Palm Sunday, Easter Sunday, Ascension, and Whitsunday, on all of which the Copts "wear new clothes (or the best they have), feast, and give alms" (Lane). They also observe, as minor festivals, Maundy Thursday, Holy Saturday, the feast of the Apostles (11th July), and that of the Discovery of the Cross.

---

[1] As, at a later period (601), Gregory the Great instructed his Anglo-Saxon missionaries so to Christianize the temples, festivals, etc., of the heathen "ut duræ mentes gradibus vel passibus, non autem saltibus, eleventur."

[2] Manumission, however, was lawful on any day.

In common with most of the churches of the Reformation, the Church of England retained a certain number of feasts besides all Sundays in the year. They are, besides Monday and Tuesday both in Easter-week and Whitsun-week, as follows:—the Circumcision, the Epiphany, the Conversion of St. Paul, the Purification of the Blessed Virgin, St. Matthias the Apostle, the Annunciation of the Blessed Virgin, St. Mark the Evangelist, St. Philip and St. James (Apostles), the Ascension, St. Barnabas, the Nativity of St. John Baptist, St. Peter the Apostle, St. James the Apostle, St. Bartholomew, St. Matthew, St. Michael and all Angels, St. Luke the Evangelist, St. Simon and St. Jude, All Saints, St. Andrew, St. Thomas, Christmas, St. Stephen, St. John the Evangelist, the Holy Innocents. The 13th canon enjoins that all manner of persons within the Church of England shall from henceforth celebrate and keep the Lord's day, commonly called Sunday, and other holy days, according to God's holy will and pleasure, and the orders of the Church of England prescribed in that behalf, that is, in hearing the Word of God read and taught, in private and public prayers, in acknowledging their offences to God and amendment of the same, in reconciling themselves charitably to their neighbors where displeasure hath been, in oftentimes receiving the communion of the body and blood of Christ, in visiting of the poor and sick, using all godly and sober conversation. (Compare Hooker, *E. P.*, v. 70). In the *Directory for the Public Worship of God* which was drawn up by the Westminster Assembly, and accepted by the Church of Scotland in 1645, there is an appendix which declares that there is no day commanded in Scripture to be kept holy under the gospel but the Lord's day, which is the Christian Sabbath; festival days, vulgarly called holydays, having no warrant in the Word of God, are not to be continued; nevertheless it is lawful and necessary, upon special emergent occasions, to separate a day or days for public fasting or thanksgiving, as the several eminent and extraordinary dispensations of God's providence shall administer cause and opportunity to his people.

Several attempts have been made at various times in western Europe to reorganize the festival system on some other scheme than the Christian. Thus at the time of the French Revolution, during the period of Robespierre's ascendency, it was proposed to substitute a tenth day (Décadi) for the weekly rest, and to introduce the following new festivals:—that of the Supreme Being and of Nature, of the Human Race, of the French People, of the Benefactors of Mankind, of Freedom and Equality, of the Martyrs of Freedom, of the Republic, of the Freedom of the World, of Patriotism, of Hatred of Tyrants and Traitors, of Truth, of Justice, of Modesty, of Fame and Immortality, of Friendship, of Temperance, of Heroism, of Fidelity, of Unselfishness, of Stoicism, of Love, of Conjugal Fidelity, of Filial Affection, of Childhood, of Youth, of Manhood, of Old Age, of Misfortune, of Agriculture, of Industry, of our Forefathers, of Posterity and Felicity. The proposal, however, was never fully carried out, and soon fell into oblivion.

Mahometan Festivals.—These are chiefly two—the 'Eed es-Sagheer (or minor festival) and the 'Eed el-Kebeer (or great festival), sometimes called 'Eed el-Kurban. The former, which lasts for three days, immediately follows the month Ramadan, and is generally the more joyful of the two; the latter begins on the tenth of Zu-l-Heggeh (the last month of the Mahometan year), and lasts for three or four days. Besides these festivals they usually keep holy the first ten days of Moharram (the first month of the year), especially the tenth day, called Yom Ashoora; the birthday of the prophet, on the twelfth day of the third month; the birthday of El-Hoseyn, in the fourth month; the anniversary of the prophet's miraculous ascension into heaven, in the seventh month; and one or two other anniversaries (see vol. vii. p. 630). Friday, called the day of El-Gumah (the assembly), is a day of public worship; but it is not usual to abstain from public business on that day except during the time of prayer.

Hindu and Buddhist Festivals.—In modern India the leading popular festivals are the Holí, which is held in March or April and lasts for five days, and the Dasahara, which occurs in October (see Hunter's *Statistical Account of Bengal*). Although in its origin Buddhism was a deliberate reaction against all ceremonial, it does not now refuse to observe festivals. By Buddhists in China, for example, three days in the year are especially observed in honor of the Buddha,—the eighth day of the second month, when he left his home; the eighth day of the fourth month, the anniversary of his birthday; and the eighth of the twelfth, when he attained to perfection and entered Nirvāna. In Siam the eighth and fifteenth days of every month are considered holy, and are observed as days for rest and worship. At Trut, the festival of the close of the year, visiting and playgoing are universal. The new year (January) is celebrated for three days; in February is another holiday; in April is a sort of Lent, ushering in the rainy season; on the last day of June presents are made of cakes of the new rice; in August is the festival of the angel of the river, "whose forgiveness is then asked for every act by which the waters of the Meinam have been rendered impure." See Bowring's *Siam* and Carné's *Travels in Indo-China and the Chinese Empire*. Copious details of the elaborate festival-system of the Chinese may be found in Doolittle's *Social Life of the Chinese*. (J. S. BL.)

FESTUS, Sextus Pompeius, a Latin grammarian of uncertain date, but who probably flourished in the 2d century of the Christian era. He wrote an epitome of the celebrated work *De Verborum Significatione*. This was a valuable treatise on many obscure points of grammar, mythology, and antiquities, written by M. Verrius Flaccus, a grammarian who flourished in the reign of Augustus. The abridgment of Festus has been done rather mechanically, and without sufficient discrimination. He has also made a few alterations, and inserted some critical remarks of his own, besides omitting altogether such ancient Latin words as had long been obsolete. These he discussed in a separate work now lost, entitled *Priscorum Verborum Libri cum Exemplis*. Of Flaccus's work, only a few fragments have come down to us, and of Festus's epitome only one original copy is known to be in existence, and that in a very imperfect form. After passing through very many vicissitudes, it found a temporary shelter in the Farnese library at Parma, whence in 1736 it was taken to Naples. At the close of the 8th century Paulus, commonly called Diaconus, who happened to possess a copy of Festus's work, epitomized it; but, being an imperfect scholar, he allowed countless errors to creep into his abridgment, although he abstained from making any additions of his own. From this work of his, and the solitary mutilated copy of the original which still survives, some of the most distinguished scholars of modern Europe have attempted to reconstruct the important treatise of Festus. Of the early editions the best is that of Scaliger, published in 1565, and with supplements by Fulvius Orsinus in 1581. By both these editors many of the blanks are filled up by conjecture. But by far the best of existing editions is that of K. O. Müller, Leipsic, 1839. Festus gives not only the meaning of every word in his treatise, but also its etymology; and his work, fragmentary as it is, has thrown considerable light on the language, mythology, and antiquities of ancient Rome.

FETICHISM is a stage of worship, or of the ways of regarding nature (for in simple states of mind religion and philosophy are in great part merged) in which ordinary material objects are regarded as holding, or as being the vehicle of, supernatural powers and influences,—which powers and influences can, it is supposed, be controlled or directed by the person possessing the object so endowed.

Religions have not, as yet, been scientifically classified in anything like a final manner. Even the most rigorous of minds would hardly assert that the time has yet arrived for such a classification. But it is possible, even now, to collect roughly those beliefs which, whether still existing among savages and uneducated people of all classes or traceable only among the records of the past, bear a general resemblance to each other, and to give a general name marking that resemblance. Such a name we have in "fetichism." The word *feitiço*, corresponding to our "fetich," seems to have been first applied by Portuguese traders on the west coast of Africa to savage objects of worship, which were noticed from their resemblance to the talismans and charms common in Europe, and popular with sailors and travellers above all men.

In Purchas's *Pilgrimage* (1614) is a chapter translated from a Dutch author relating to the customs and rites of the negroes of Guinea, in which *fetissos* and *fetisseros*, or priests, are frequently mentioned. "When the king will sacrifice to *fetisso*, he commands the *fetissero* to inquire of a tree whereto he ascribeth Divinity, what he will demand;" and so the author goes on to describe the manner of questioning this remarkable tree. The word fetich was, however, first used in a general sense by a thoughtful scholar of the 18th century, the president Charles de Brosses, who, in his work *Du Culte des Dieux Fétiches*, strung a number of facts relating to savages on a theory tracing fetichism in Egyptian and classic mythology and in modern life. Comte, the French philosopher, gave great currency to the term by employing it to characterize what he regarded as a great and necessary stage in the theological development of humanity,—a state "plus ou moins prononcé, mais ordinairement tres durable, de pur fétichism, constamment characterisé par l'essor libre et direct de tendance primitive à concevoir tous les corps exterieurs quelconques, naturels ou artificiels; comme animés d'une vie essentiellement analogue à la nôtre, avec des simples differences mutuelles d'intensité" (*Philosophie Positive*, v. 30). In England, and at present among anthropologists generally, the word bears a far more restricted meaning than the one here given to it by Comte. It is applied, not to a belief ascribing volition and will to all objects, to all matter, but to a belief in the peculiar power of certain objects, which power may be discovered and tested by experiment, any success, of course, confirming the hypothesis and giving reputation to the chance-chosen object as a great and potent fetich. Sir J. Lubbock defines fetchism "as that stage of religious thought in which man supposes he can force the deities to comply with his desires." He regards it as the next stage above pure atheism in the religious progress which passes from it, through totemism and shamanism, into idolatry (*Origin of Civilization*, 199). Tylor defines it as "the doctrine of spirits embodied in, or attached to, or conveying influence through, certain material objects."

Both natural and artificial objects are used as fetiches. To the savage nothing seems too great to serve his individual purposes, nothing too insignificant or commonplace to be the centre of his ideas of power and devotion.

Generally upon beginning an expedition the negro of Guinea chooses the first object that presents itself to his eyes upon issuing forth, and vows to worship that as a god if the work in hand prove successful; if not, it is cast aside as useless or worse. Stones, trees, twigs, pieces of bark, roots, corn, claws of birds, teeth, skins, feathers, human and animal remains of all kinds—anything that may strike the savage as in any way peculiar—are used in this manner; even whole species of animals, rivers, the sea, the moon, and the sun. Articles of costume, tools, weapons, boats, and other articles of human manufacture are not objected to.

Museums of such of these things as may have accompanied success in any expedition are kept, and are regarded as sacred places, not to be entered without reverence. Other such objects are the property of private individuals, household gods, and are consulted upon all occasions of importance. If the wishes of the worshipper be not granted, all a savage's rather powerful vocabulary of abuse is exhausted upon the fetich. It is kicked, stamped upon, dragged through the mud. Change of luck, however, produces apologies, and promises of future regard and worship. Savages who have taken trees as their fetiches, if they are unlucky cut down trees in revenge. The actions seem rather to be tentatives for the discovery of hidden power than those of any formulated and dogmatic cultus.

In considering the state of mind which all this kind of action implies, we must remember that not only human beings, not only animate beings, are regarded by savages as possessing spirits, but that they attribute spirits to inanimate objects also. The sight of the figures of departed friends and ancestors in dreams gives notice of a world of spirits, but each appearing "in his habit as he lived" seems to imply that garments, weapons, and other objects of human social environment must have spirits also. When a chief dies wives and slaves are slain, weapons broken, garments rent to pieces,—for what reason, but that the warrior should not go naked and alone to the world of spirits? As a deadly blow sets free the spirits of animate, so fracture and destruction set free the spirits of inanimate objects.

But the belief in the efficacy of peculiar objects upon a person's welfare is not by any means confined to savages. Witchcraft is a form of fetichism, and it can hardly be said to be dead from among us even now. Others than children may be found who will keep a crooked sixpence, a curious stone, a hard potato, for luck,—prompted by exactly those instincts, which, although long superseded in some races, are perhaps the highest the savage possesses. The power of the fetich seems in many cases, however, to be regarded not as superhuman, but as extra-human. The tendency to believe that what precedes, accompanies, or follows a thing or accident must be somehow causally connected with it is ever prevalent; and to palliate our wonder at the gross superstitions of the savage we must remember how many people we have met in the heart of modern civilization who are careful about lucky and unlucky days and numbers. As the fetich becomes more and more endowed with personality and will, so the belief passes imperceptibly into what is called idolatry.

See Brosses, *Du Culte des Dieux Fétiches*, 1760; Dulaure, *Hist. des differens cultes*, 1828; Lubbock, *Origin of Civilization;* Tylor, *Primitive Culture;* Schultze, *Der Fetischismus*. (W. HE.)

FÉTIS, **François Joseph** (1784–1871), although a fertile composer of almost every kind of music, will be chiefly remembered as a theoretical and critical writer. He was born at Mons in Belgium, March 25, 1784, and was trained as a musician by his father, who followed the same calling. In 1800 he went to Paris and completed his studies at the Conservatoire under such masters as Boieldieu, Rey, and Pradher. After many vicissitudes he was in 1823 appointed professor at the same celebrated institute, and remained in the French capital for ten years, till in 1833 he obtained the directorship of the music-school of Brussels, which owes much to his indefatigable zeal. He also was the founder, and, till his death, the conductor of the celebrated concerts attached to the conservatoire of Brussels. In this important position he exercised a potent influence on musical education and musical taste in Belgium. He also furnished a large quantity of original compositions, from the opera and the oratorio down to the simple chanson. But all these are doomed to oblivion. Although not without traces of scholarship and technical ability, they show total absence of genius. More important are his writings on music. They are partly historical, such as the *Curiosités historiques de la musique*, Paris, 1850, and the unfinished *Histoire universelle de musique*, of which only the first three volumes have appeared (Paris, 1869–1872), partly theoretical. Amongst the latter the *Méthode des méthodes de piano* (Paris, 1837), written in conjunction with Moscheles, may be named. By far the most important of his works is the celebrated *Biographie Universelle des Musiciens*, commenced as early as 1806, but not published till 1834 (in 8 vols.). Although full of mistakes, and marked by narrowness and onesidedness of critical judgment, it is a work of vast and varied information, and as such still unsurpassed. Fétis died at Brussels in 1871. His valuable library was purchased by the Belgian Government and presented to the conservatoire.

FEU, in the law of Scotland, signifies, in its widest sense, any tenure of land by which the relation of superior (or overlord) and vassal is constituted. Of these tenures the feudal system in Scotland has recognized five,—ward (the original military tenure, abolished in 1747), feu, blench, mortification, and burgage. The term feu, however, is now in practice restricted to one of these, feu-holding or feu-farm, which is a grant of land, or property connected with land, in perpetuity, on condition of the grantee making to the granter a fixed annual payment of a substantial nature with a liability for certain contingent payments termed casualties—the radical right to the whole remaining with the granter. It is opposed to blench-holding—the only other feudal tenure now made use of in Scotland—in which the payment to the superior is merely nominal in amount, *e. g.*, a penny Scots. The feudal system embraces the whole of Scotland except Orkney and Shetland, where remains of the udal right are still to be found. It is a fundamental principle of the system as developed in Scotland to permit subinfeudation to an unlimited extent,—that is, every vassal, unless restrained by special agreement, may feu the whole or part of his land to another person, who thereby becomes his sub-vassal; and by the Act of 1874 conditions by superiors prohibiting subinfeudation cannot thereafter be lawfully made. The feu-duty is usually a payment either in money or in kind, Services, however, are still legal if they are not of a military nature; but they must be paid within the year, as is also the case with blench duties of whatever sort. The casualties now recognized are —relief, the fine payable by an heir on succeeding; composition, that payable by a stranger; and life-rent escheat, the forfeiture to the superior of the annual profits of the land while the vassal is civilly dead for failing to answer for a crime. The vassal, also, if he is two years in arrears in payment of the feu-duty and allows decree of irritancy, as it is called, to pass against him, loses his right absolutely. Casualties were at one time more numerous and more irksome in their incidence than at present, for the law now regards with disfavor all feudal payments not of a fixed periodical nature. Indeed, it may be said that casualties no longer exist, for the Conveyancing (Scotland) Act of 1874 has abolished all payments of a contingent nature in new feus, and provides for the commutation of those already existing. This Act, while it has preserved the name, has really destroyed the relation of superior and vassal, as that has been long understood in Scotland. A feu is the usual title upon which land is granted for building purposes in Scotland. Long building-leases are not much known; and this has greatly contributed to the durable nature and value of Scotch house property.

FEUCHTERSLEBEN, EDUARD, FREIHERR VON (1806–1849), an Austrian physician, philosopher, and poet, was born at Vienna on the 29th April, 1806. He entered the university of Vienna in 1825, and obtained his doctor's degree in 1833. In 1845 he became dean of the faculty of medicine, and in 1847 was named vice-director of medico-chirurgical studies. In July, 1848, he was appointed under-secretary of state of the education department, but resigned his office in the same year, and died 3d September, 1849.

His principal prose writings are *Ueber das Hippokratische erste Buch von der Diätetik*, Vienna, 1835; *Ueber die Gewissheit und Würde der Heilkunst*, Vienna, 1835; *Lehrbuch der ärztlichen Seelenkunde*, Vienna, 1835, translated into English under the title *Medical Physiology;* and *Zur Diätetik der Seele*, Vienna, 1838. He obtained some reputation also as a poet. Some of his verses are lyrical, but most are of a didactic character. His collected works—with the exception of those purely medical—edited by the poet Hebbel, were published in 7 vols. at Vienna, 1851–53.

FEUDALISM, FEUDAL SYSTEM. *Feodum*, *feudum*, fief, or fee is derived from the German *Vieh*, cattle (Gothic, *faihu;* Old High German, *fihu;* Old Saxon, *fehu;* Anglo-Saxon, *feoh*); in a secondary sense the word came to denote goods, money, property in general. The second syllable has been connected with another root, *od*, also meaning property,—the whole word denoting property held as a reward, or in consideration of special service. Whether this etymology be correct or not, this is the signification which the word acquired in time. "The word *feodum* is not found earlier than the close of the 9th century. But neither the etymology of the word nor the development of its several meanings can be regarded as certain."[1]

Feudalism in a broad sense may be taken to mean a social organization based on the ownership of land, and personal relations created by the ownership of land,—a state of things in which public relations are dependent on private relations, where political rights depend on landed rights, and the land is concentrated in the hands of a few. Feudalism in this sense has existed, and perhaps may still exist, in various parts of the world; but the feudal system *par excellence* is always understood to mean that special form of feudalism which was developed on the soil of Gaul by the conquering Franks. England had a feudalism of its own, developed simultaneously but independently through the operation of similar causes. Just as the insular feudalism had reached its maturity, the continental feudalism was brought over ready-made by the Normans, and superimposed on the basis of the domestic product. Thus our social state exhibits elements derived from both forms of feudalism, in conjunction with fossil relics of still earlier institutions. Both varieties of feudalism may be regarded as transition states, intervening between the rough wild liberty of primitive society based on individualism and the carefully organized liberty of modern society based on the effectual supremacy of the law.

Both forms of feudalism had their roots in the organization of primitive Germany. A glance at that system is desirable for a thorough comprehension of our subject; it will help us to realize what feudalism was, if not to discern how it grew up. The leading characteristics of the Teutonic polity were individual liberty and tribal autonomy. Each tribe or canton is theoretically independent and entitled to manage its own concerns; within the tribe all free heads of houses are politically equal, and entitled to a voice in the affairs of the community. Each free villager has his share of the tribe lands,—his homestead, his proportion of the arable land, with corresponding rights over the forest and pasture-lands. The shares are not necessarily equal, as social distinctions exist, and are fully recognized by the law; but whether large or small, the shares are held on the like terms of participation in all public duties, chief of which are the obligations of attendance in the communal meetings and in the host. The shares so held "bore among the northern nations the name of Odal or Edhel."[2] Whether any etymological connection exists between the words *odal* and *alod* "may be questioned, but their signification as applied to land is the same: the alod is the hereditary estate derived from primitive occupation, for which the owner owes no service except the personal obligation to appear in the host and in the council."[3] As above intimated, political equality was not held incompatible with social inequality; the population was divided into three classes, rated at different values in the legal tariff. First came the *nobilis*, *eorl*, or *ætheling*, the man distinguished by ancestral wealth and reputed purity of blood; next ranked the simple freeman, the *ingenuus*, *frilingus*, or *ceorl;* at the bottom of the social scale stood the serf or slave (*colonus lazzus*, *læt*, *servus*, *theow*). An injury done to an *eorl* or his property would cost the offender twice or three times as much as the same injury done to a *ceorl;* at an equal distance below the *ceorl* ranks the slave, but the compensation for injury done to him of course goes to his master. The official magistracy (*principes*) are selected from the ranks of the nobility; very distinguished parentage will at times entitle a mere lad to high office, but this is rare.[4] Superior birth gives weight and precedence in the national councils; above all, where a powerful tribe or confederation of tribes think fit to exalt their dignity by conferring regal honors on their chief, care is taken to select the king from the family of noblest birth. But in critical times the instinct of a free people taught that the claims of birth must give place to more weighty considerations; whoever might be allowed to rule in time of peace, on the field of battle only the man of tried ability could take the lead.[5] Judicial and political business was transacted in the various national assemblies held at fixed times, "generally at the new or full moon." Local questions and matters of police were determined in the meetings of the mark or township (*vicus*, *dorf*); the higher criminal jurisdiction and questions of a political nature were reserved for the *malls* or *gemotes* of the hundred, canton, or tribe (*gau*, *pagus*, *gens*); "there was no distinction of place; all were free, all appeared in arms." The order of business was settled beforehand by the chiefs in committee, a leading elder would open the debate; others followed as the spirit moved them; the people decided as they thought fit. "Opposition was expressed by loud shouts, assent by the striking of spears, enthusiastic applause by the clash of spear and shield."[6]

The analogy of popular meetings in other ages and countries will warrant the belief that under ordinary circumstances the people would be greatly swayed by the policy of their leaders, but the fact remains that the ultimate appeal was to the people. So with the local judicial meetings: the position of the elected *princeps* is "rather that of president than of judge;" all the free men sit as his assessors. "Doubtless they both declared the law and weighed the evidence." The authority of the *princeps* was in all cases limited: "De minoribus rebus principes consultant; de majoribus omnes."[1] Even the prerogatives of the monarchical chiefs were subject to strict limitations. Their position was one of high honor but not of irresponsible power. The practical influence of the chief, whether exalted to royal dignity or not, depended largely upon the strength of his *comitatus*, or household retinue. This institution, "one of the strangest but most lasting features" of early Aryan civilization, was an arrangement "partly private and partly public in its character," which served to furnish "a sort of supplement to an otherwise imperfect organization."[2] The *comitatus* was a voluntary bond of partial vassalage, intended for mutual protection and support, by which a freeman, even a man of noble birth, attached himself to a more powerful lord (*hlaford*,[3] *princeps*). At the table of his lord the free companion, as he was called (*comes*, gesith), found a comfortable seat; from his lord he received his equipment for war or the chase (*heregeatwe*, heriot), which reverted to the lord at his death. In return he was bound to espouse the cause of his lord as against all men and by all means. The position of a favored gesith was one of comfort and social importance; but involving, as it did, the surrender of all freedom of individual action, it probably entailed a certain diminution of political status.[4] The tie of the comitatus, when coupled with the tenure of land, gives us the germ from which the whole feudal system was developed.[5] It has been commonly held, apparently on the authority of Montesquieu, that the Frankish conquests in Gaul were effected by independent nobles fighting each with a powerful comitatus at his back; that the lands so conquered were immediately parcelled out by them among their *comites* upon terms of military service and special fidelity; and that the Merwing state from the first was built up on the feudal principle of vassalage.[6] The sound view appears to be that—as in Britain, so in Gaul—the Germanic tribes came over as "nations in arms," "with their flocks and their herds, their wives and their little ones;" that they brought their Germanic social and political organization with them; and that the Merwing kingdom was mainly constructed on that basis—subject to modifications introduced perforce by the circumstances of the conquest. In Britain it is clear that the primitive political institutions were introduced *en bloc*, and took root; of the agrarian settlement effected, evidence is lacking during the first centuries of the new order. When trustworthy data begin to appear feudalism has already made large inroads on primitive alodialism. In Gaul the chain of evidence is continuous, and it is beyond doubt that under the first dynasty the tenure of land was still mainly alodial; that all the people were bound to be faithful to the king as a national duty, and not by virtue of special land tenure; that "the gift of an estate by the king involved no defined obligation of service," all the nation being still bound to military service; that "the only comites were the *antrustions*, and these few in number;" and that the supposed larger class of comites, the *leudes*, were in fact the whole body of the king's good subjects, in Anglo-Saxon phrase, his "hold."[7]

[6] Stubbs, *sup.*, 29; Tacitus, *sup.*, ch. 11–13.

If we pass to the close of the 10th century, and take a survey of the social condition of western Europe, we shall find all the principles of the primitive Germanic society inverted. Political organization from being personal has become territorial; "the ideas of individual freedom and political right" have "become so much bound up with the relations created by the possession of land as to be actually subservient to them."

Everything belongs either to the king or the lord. Thus in England the national peace is now the king's peace; the state domain—the folkland—is *terra regis*. The township has become the lord's manor, the township waste the lord's waste, the township court the lord's court. "Land has become the sacramental tie of all public relations; the poor man depends on the rich, not as his chosen patron, but as the owner of the land that he cultivates, the lord of the court to which he does suit and service, the leader whom he is bound to follow to the host."[8] This dreary result was not accomplished in a day. But the causes began to operate from a very early period. Even if each free immigrant received his due family portion of land, a much larger allotment would certainly be assigned to the leader, who might be considered to have contributed most to the success of the undertaking; whole townships in a dependent position might thus be established from the very first. The leaders of the migration of course came armed with all the exceptional powers usually conferred on *duces* in time of war; the position of the new comers, as military colonists encamped on the lands of others, led to a prolongation of those powers. Strong government was an absolute necessity; consequently royalty, previously unknown to the Anglo-Saxon tribes, makes its appearance as an immediate consequence of the conquest. Five years after his landing the "heretoga" Hengest is raised to kingship. When the resistance of the natives was crushed, political wars and wars of succession between the invaders themselves ensued, each struggle adding to the private possessions and political influence of the victorious chief. "Everything, in fact, which disturbs the peaceful order of the village system tends to the aggrandizement of the leading family and its chief."[9] The new order of things, however, sprang from two great sources, the beneficiary system and the practice of "commendation." "On Gallic soil it was specially fostered by the existence of a subject population, which admitted of any amount of extension in the methods of dependence."[10]

The system of benefices had its origin partly in grants of land made by kings and *principes* to their *comites*, kinsmen, and servants, on terms of special fidelity,—analogous to, if not identical with, the bond of the *comitatus*,—partly in the surrender of alodial estates made by the owners to lay or ecclesiastical potentates, to be received back, and held under them as *beneficia*. By this arrangement the dependant bought the protection of a temporal or spiritual patron. Commendation was a similar arrangement, entered into without reference to land;[11] the weaker man placed himself under the personal protection of a superior "without altering his title or divesting himself of his estate: he became a vassal and did homage. The placing of his hands between those of his lord was the typical act by which the connection was formed. And the oath of fealty was taken at the same time. The union of the beneficiary tie with that of commendation completed the idea of feudal obligation." Both lord and "man" have a hold on the land; each has his duty to the other,—the one to protect, the other to support. "A third ingredient was supplied by the grants of immunity by which the dwellers on a feudal property were placed under the tribunal of the lord, and the rights which had belonged to the nation or its chosen head were devolved upon the receiver of a fief."[12]

The system so formed was of mingled origin. The beneficium "is partly of Roman partly of German origin;" commendation might be traced up to the comitatus or the Roman clientship, or possibly to Celtic usages of kindred ancestry.[13] All these elements, the benefice proper, the surrendered alod, the personal commendation, the private jurisdiction, find their place in English as well as in French history, but the elements were blended in different proportion, and under external conditions of a different character. In England the tie of the comitatus played an important part, and became the basis of the later Anglo-Saxon nobility. On the Continent the comitatus was soon lost in "the general mass of vassalage;"[14] on the Continent territorial influences became paramount; in England personal and legal influences were never extinguished. Both in France and England the process of commendation was fostered by edicts of the central Government, requiring, for purposes of police, that all persons of humble station should place themselves under lords.[1] "The process by which the machinery of government became feudalized, though rapid, was gradual." In 843, the date of the great treaty of Verdun, two princes shared the land of France with Charles the Bold, namely, the king of Aquitaine and the duke of Brittany.[2] In 877 Charles was induced to publish a recognition of the hereditary character of benefices. By the end of the century nine-and-twenty provinces, or parts of provinces, had been erected into petty states; by the year 1000 the list had swelled to fifty-five.[3]

[10] Stubbs, *sup.*, 252.

[11] Stubbs, following Waitz, ii. 262, iv. 210, denies any connection between the commendation and the beneficiary system of the Frank empire with the primitive comitatus. Roth, *Beneficialwesen*, 385, regards commendation as "placing a man in the relation of comitatus to his lord; and he makes the Frank antrustionship a link between the primitive comitatus and later feudalism.

[12] Stubbs, *sup.*, 253.

[13] Waitz, iv. 199.

[14] "In the Frank empire the beneficiary system is unconnected with the comitatus; in the English they are in the closest connection."—Stubbs, 153. In spite of this authority, it seems hard to believe that there was no connection whatever between the Frank benefices and the comitatus.

> "The weakness of the Karoling kings gave room for the speedy development of disruptive tendencies in a territory so extensive and so little consolidated. The duchies and counties of the 8th and 9th centuries were still official magistracies, the holders of which discharged the functions of imperial judges or generals. Such officers were of course men whom the kings could trust, in most cases Franks, courtiers or kinsmen, who at an earlier date would have been *comites* or *antrustions*, and who were provided for by feudal benefices. The official magistracy had in itself the tendency to become hereditary, and when the benefice was recognized as heritable, the provincial governorship became so too. But the provincial governor had many opportunities of improving his position, especially if he could throw himself into the manners and aspirations of the people he ruled. By marriage or inheritance he might accumulate in his family not only the old alodial estates which, especially on German soil, still continued to subsist, but the traditions and local loyalties which were connected with the possession of them.[4] So in a few years the Frank magistrate could unite in his own person the beneficiary endowment, the imperial deputation, and the headship of the nation over which he presided. And then it was only necessary for the central power to be a little weakened, and the independence of duke or count was limited by his homage and fealty alone,—that is, by obligations that depended on conscience alone for fulfilment. It is in Germany that the disruptive tendency most distinctly takes the political form; Saxony and Bavaria assert their national independence under Swabian and Saxon dukes who have identified the interests of their subjects with their own. In France, where the ancient tribal divisions had long been obsolete, and where the existence of the alod involved little or no feeling of loyalty, the process was simpler still; the provincial rulers aimed at practical rather than political sovereignty; the people were too weak to have any aspirations at all; the disruption was due more to the abeyance of central attraction than to any centrifugal force existing in the provinces. But the result was the same; feudal government, a graduated system of jurisdiction based on land tenure, in which every lord judged, taxed, and commanded the class next below him; in which abject slavery formed the lowest, and irresponsible tyranny the highest grade; in which private war, private coinage, private prisons, took the place of the imperial institutions of government."[5]

This was the social system under which William the Conqueror and his barons had been brought up. English indigenous feudalism had reached its height in 1017, when Cnut "dealt" all England into four earldoms—"to himself the West Saxons, to Thorkell the East Anglians, to Eadric the Mercians, and to Eric the Northumbrians."[6] The four jurisdictions are spoken of as co-ordinate. Such a system, with time, might easily have ripened into continental feudalism. But William had no mind to encourage feudalism as a system of government; on the contrary, he took care to introduce that which England never before had enjoyed, a real central administration, and in that aspect he arrested the growth of feudalism in England. As a system of land tenure it was the only arrangement that he could have conceived or understood; and England was already so extensively feudalized in fact that it seemed the merest change of theory to make all subjects tenants, and the king the universal lord and sole alodial owner. The barons were allowed to take up the hereditary jurisdictions already existing on the estates on which they entered; but the administrative functions of the Anglo-Saxon earls were transferred to the king's sheriffs. The barons resisted, but William's strong arm kept them down; again and again under his two sons the struggle was renewed. "The English, who might never have struggled against native lords, were roused by the fact that their lords were strangers as well as oppressors, and the Norman kings realized the certainty that if they would retain the land they must make common cause with the people."[7] Under Stephen feudalism burst out in all its horrors; fortunately the conflagration burnt itself out. The English rallied again round Henry II.; the great houses of the Conquest successively "suffered forfeiture or extinction;" the other Normans became Englishmen; and the legal and constitutional reforms of Henry II., with the help of the nation, "put an end to the evil."[8]

In France the royal authority had been reduced to a shadow. But

> "the shadow is still the centre round which the complex system, in spite of itself, revolves. It is recognized by that system as its solitary safeguard against disruption, and its witness of national identity; it survives for ages, notwithstanding the attenuation of its vitality, by its incapacity for mischief. In course of time the system itself loses its original energy, and the central force gradually gathers into itself all the members of the nationality in detail, thus concentrating all the powers which in earlier struggles they had won from it, and incorporating in itself those very forces which the feudatories had imposed as limitations on the sovereign power. So its character of feudal suzerainty is exchanged for that of absolute sovereignty. The only checks on the royal power had been the feudatories: the crown has outlived them, absorbed and assimilated their functions; but the increase of power is turned, not to the strengthening of the central force, but to the personal interests of its possessor. Actual despotism becomes systematic tyranny, and its logical result is the explosion which is called revolution. The constitutional history of France is thus the summation of the series of feudal development in a logical sequence which is indeed unparalleled in the history of any great state, but which is thoroughly in harmony with the national character, forming it and formed by it."[9] (J. H. R.)

Remains of Feudalism in English Land Laws.

Feudalism, although it has ceased to exist as a system of political and social relations, still survives as the basis of the law relating to land, both in England and Scotland. The most elementary conceptions of real property carry us back to the relations of lord and vassal, and cannot be understood without reference to them. Ownership of land, in the full sense of the phrase, is unknown to the law of England. There is no such thing as absolute property in land, says the chief English writer on that subject; a man can only have an estate or interest in land. Every landowner, in the popular sense of the phrase, is, in the eye of the law, a tenant only; and such is the case with the largest and most unlimited interest known to the law—that of an estate in fee-simple. The owner in fee is the tenant of some one else, who in his turn is the tenant of another, and so on, until the last and only absolute owner is reached, viz., the king, from whom directly or indirectly all lands are held. The spirit of feudalism has, of course, entirely gone out of the system; only the skeleton is left. Between a tenant in fee-simple and his lord there is no connection whatever except in legal theory; in point of fact, it is for the most part unknown who the lord of a particular tenant may be. There are, however, new contingencies, in which the feudal theory may still yield positive results. Such, for instance, is the case of ESCHEAT (*q. v.*), in which, on the failure of heirs of freeholders dying intestate, the land would go to the next lord, and in the absence of a mesne-lord to the crown. In the case of COPYHOLDS (*q. v.*), the incidents of feudal tenure survive in a more marked degree than in any other class of estates. They sprang from an inferior kind of feudal holding, and remained subject to the custom of the manor to which they belonged. With the exception of such cases, the feudal obligations and restrictions in which the virtue of the system resided have long disappeared. The establishment of the right of alienation, and at a later time of the testamentary disposition, of fee-simple estates, the acquisition by collusive processes of the right of breaking entail, and lastly, the formal abolition in the reign of Charles II. of the most onerous class of feudal obligations—those relating to chivalry—are the most important steps in this process. These tenures in chivalry, by knight-service, or military tenures, as they were variously called, retained the feudal spirit in its most oppressive form. The rights of *wardship* and *marriage* were perhaps the most valuable and the most burdensome of all the rights of the lord. They enabled him to seize the estate of his tenant when he was under age, to exact a fine from him on his coming of age, and to marry him or her to whomsoever he chose. By the 12

[4] "Abundant proof of this position will be found in German history. The rise of the successive families of Saxon dukes and the whole history of Bavaria under the Saxon emperors furnish illustrations. The Saxon dukes of Bavaria carry out the Bavarian policy in opposition to their near kinsmen on the imperial throne. The growth of the Swabian Welfs into perfect identification with the Saxons whom they governed affords another striking instance. In a less degree, but still to some extent, this was the case in France also; but the Gallic populations had lost before the Karoling period most of their national aspirations; nor did the Frank governors identify themselves at any time with the people. Hence the great difference in social results between French and German feudalism."

[8] *Ib.*, 257.

[9] *Ib.*, 3–4.

Charles II. c. 24 these tenures, with all their oppressive incidents, were abolished and turned into tenures "in free and common socage," *i. e.*, the ordinary non-military tenure, feudal like the other in its origin, but not subject to the obligations imposed by the military character of the tenure by knight's service. The law of real property is, however, still feudal in the sense that its main lines were laid in the times of feudalism. Its most general terms are all feudal in their original meaning. The fee (feudum) is the feudal estate descendible to a man's heirs. The *freeholder* is the tenant of an estate worthy of a free man, the smallest in quantity being an estate for his own life. To this day a gift to A. B., without other words,[1] means a gift of an estate for life only, because feudal holdings were originally granted to the tenant for his own life, and in return for his own services. And feudal conceptions have overrun and transformed large classes of rights, which in their origin were anterior to feudalism. Thus the independent rights of commoners were ignored, and their privileges were treated as favors granted to them by some lord.

FEUERBACH, Ludwig Andreas (1804–1872), fourth son of the eminent jurist (see next article), was born at Landshut in Bavaria on the 28th of July, 1804. Like other members of his family, he evinced a religious turn of mind from an early age, and he matriculated at the university of Heidelberg with the intention of studying divinity. His ardor, however, was soon diverted to metaphysical pursuits; he repaired to Berlin, became an auditor of Hegel, and, in spite of his father's vehement opposition, devoted himself to the career of a teacher of philosophy. The history of his life henceforward is that of his gradual emancipation from the yoke he had thus imposed upon himself. Even his first work, *Thoughts on Death and Immortality* (1830), exhibits the marked divergence between his mental characteristics and those of the Hegelian school. The conclusion, indeed, is Hegelian, but the author's method is dogmatic rather than dialectical, his cast of thought mystical, his phraseology original, animated with humor and pathos, and strikingly concrete. His negation of personal immortality rendered him obnoxious to the Government, and frustrated his endeavors to obtain a professorship. His embarrassed manner and awkward delivery debarred him from success as a private tutor and lecturer. After some years of disappointment he renounced the attempt to gain a livelihood by philosophy, and married a lady whose scanty dower, derived from a share in a small manufactory, included free apartments in the castle of Bruckberg, and the use of a vegetable garden and shooting in the adjacent woods. In these idyllic circumstances the philosopher supported his family for nearly a quarter of a century,—learning, as he declared, more from his peasant associates than he had learned at the university. "Berlin opened my mouth, Bruckberg my eyes." During his early struggles and the period of his betrothal he had produced his *History of Modern Philosophy*, a series of criticisms of leading thinkers from Bacon to Leibnitz, and his monograph on Pierre Bayle, whom he sets forth as the type of the antithesis between faith and knowledge. His rupture with Hegelianism was first indicated in his *Critique of Hegel* (1839). It was grounded on his growing aversion to mere verbal juggles, and his strengthening conviction that philosophical research must be based upon the investigation of actual phenomena. The enthusiast for metaphysics had ceased to be a metaphysician, and had become the mouthpiece of a reaction the more remarkable from its independence of the contemporaneous development of physical science. The phenomena with which Feuerbach dealt were nevertheless wholly psychological. Those referring to the religious sentiment formed the subject of his next and most celebrated work, *The Essence* (*Wesen*) *of Christianity* (1841). In this famous treatise Feuerbach shows that every article of Christian belief corresponds to some instinct or necessity of man's nature, from which he infers that it is the creation and embodiment of some human wish, hope, or apprehension. The same process of interpretation is applied to natural religion in his essay on that subject (1845), and in his lectures delivered at Heidelberg during the revolutionary troubles of 1848 and 1849. This period of anarchy promised for a moment to bring Feuerbach prominently before the world; the inglorious collapse of the revolution gave an irrecoverable blow to his influence. Notwithstanding his own very reserved attitude, he had become identified in the public mind with the agitators who had made a watchword of his name, and unjustly participated in their discredit. He returned to Bruckberg, and occupied himself partly in scientific research, partly in the composition of his last important work, the *Theogony* (1857). Days of tribulation were now in store for him. Driven from his retreat at Bruckberg by the failure of the manufactory on which he had so long depended, too proud to implore aid, and incapable of writing for mere bread, he would have suffered the extremity of want but for the unsolicited contributions of a few friends, assisted shortly before his death by a public subscription. His intellectual faculties were impaired by successive strokes of paralysis, and he had ceased to take any active interest in human affairs when he expired on September 13, 1872.

Feuerbach is a remarkable figure in the history of modern thought. As a philosopher, he personifies at once the intellectual bankruptcy of mere verbal metaphysics, and the reaction towards empiricism based on the actual observation of nature and society. He reaches substantially the same conclusions as the modern professor of physical science, but by a different path, and independently reproduces the scientific spirit of Positivism, with a total suppression of its sacerdotal element. As a writer on religion his position is ambiguous. Following up the hint of one of the oldest Greek philosophers, he demonstrates that religious ideas have their counterparts in human nature, and assumes that they must be its product. "All theology is anthropology." It does not seem to have struck him that the proposition might equally well be inverted, and might afford scope for a problem as insoluble as that concerning the priority of the owl and the egg. His principal work, however, is rather remarkable for depth and truth of feeling than exactness of reasoning; it wears indeed a semblance of logical consecutiveness, but consists essentially of a series of aphorisms, enunciated dogmatically, somewhat in the manner of Emerson. Ethically, his system has done much good by its lofty views of human nature, and the consecration with which it dignifies the most ordinary passages of human life; and not a little harm by the encouragement which an anthropocentric theory necessarily affords to excessive individual pretensions, and thus indirectly to political and social discontent. Its strongest points are its vigorous grasp of reality, embodiment of ideal aspirations in familiar forms, healthy optimism, and recognition of the value of everything human as such. "Only in action," said Feuerbach, "do we feel ourselves free." "Let us concentrate ourselves on what is real; and great men will revive, and great actions return." "Health is more than immortality." His antagonism to the idea of personal immortality is one of his most distinctive traits, but here as elsewhere he deals with the problem solely from the psychological side. Hence he can neither be classed with materialists nor immaterialists; and, with all his frank honesty and uncompromising energy of language, the same duality of attitude characterizes his position throughout. He is from one point of view irreligious, from another deeply religious, logical and mystical, positive and speculative, academically cultured and a man of the people.

Feuerbach's personal character was highly estimable, fully conformed to the philosophic ideal in simplicity, independence, disinterestedness, and fidelity to conviction. His erudition is extensive and accurate. He possessed no brilliant or superficially attractive qualities; his manner was shy and embarrassed, and his literary composition tardy and laborious. His style, nevertheless, is sufficiently clear and even epigrammatic to make him a popular writer in his own country, but hardly in any other. His chief work, though translated by the first of living English prose writers, produced little impression in England. Out of Germany he will be most esteemed by those who have attained his results by other processes, and most memorable as an instance of the empirical spirit of modern physical science asserting itself in the region of abstract speculation, with little assistance from scientific study.

Feuerbach's *Essence of Christianity* has been translated into the principal European languages; the English version is by George Eliot. His correspondence has been edited, with a confused and imperfect biography, by Karl Grün (Leipsic, 1874). (R. G.)

FEUERBACH, Paul Johann Anselm von (1775–1833), a distinguished writer on criminal law, was born at Jena, November 14, 1775. In his infancy the family removed to Frankfort, and he received his early education at the gymnasium of that town. At the age of seventeen, he went to the university of Jena; and, his path in life not yet being fixed, his active mind eagerly sought after knowledge in all fields. He familiarized himself with the Greek and Roman classics, especially with the poets; and when the common need compelled him to work for bread as well as for knowledge, his choice fell, under the influence of Reinhold's teaching, on divine philosophy. Limiting his worldly wants to the utmost, he devoted himself heart and soul to the research of truth in its higher fields, and at twenty he had already made his mark as a powerful thinker by various philosophical essays. The influence of these early studies is apparent in the great works on which his special reputation rests. But his attention was soon concentrated on the subject to which his life was to be devoted, the science of legislation. He now sat at the feet of Schaubert and Hufeland, and the study of natural law and of jurisprudence excited in him a genuine enthusiasm. The early essays of his student years bore the impress of one of those mighty minds by which beneficent revolutions are wrought, and which open new paths to the race. In 1795 he obtained his degree of doctor in philosophy; and published one of his firstlings, as he calls it, an essay on the only possible arguments against the existence and the value of natural law. The same year he married. In 1796 he published a *Critique of Natural Law* as preparation (*Propädeutik*) for a *Science of Natural Law*. This was followed, in 1798, by his *Anti-Hobbes*, a dissertation on the limits of the civil power, and the right of resistance on the part of subjects against their rulers, and his *Untersuchungen über das Verbrechen des Hochverraths*. In 1799 he obtained his degree of doctor of laws, and received permission to deliver a course of academical lectures. These attracted many hearers, and soon won for him the rank of a master in his science. At the same time appeared an important work, which established his reputation, the *Revision der Grundsätze und Grundbegriffe des peinlichen Rechts*. In this treatise he first set forth his new theory of punishment, the intimidation theory, which was further developed and applied in the *Bibliothek für die peinliche Rechtswissenschaft*, a work produced by Feuerbach in conjunction with Grolman and Von Almendingen, and published in 1800–1801, and was systematically and thoroughly expounded in his famous *Lehrbuch des gemeinen in Deutschland geltenden peinlichen Rechts* (1801), of which the fourteenth edition appeared in 1847. In these works Feuerbach shows himself not only a great thinker and discoverer of truth, but also a gifted teacher and luminous expositor, capable of giving to principles a scientific form, and investing them with the grace and elegance of the highest literary art. His works were a powerful protest against vindictive punishments, and contributed largely to the subsequent humane reformation of criminal laws. Nor was the example of his style without influence on later writers on law. In 1801 Feuerbach was appointed professor at the university of Jena; but many offers were made to him, and in the following year he accepted a chair at Kiel. This he held for two years, lecturing on the law of nature, criminal law, the institutes, the pandects, and hermeneutics. But, disappointed at not finding so numerous, sympathizing, or promising an audience as he had expected, he removed in 1804 to the university of Landshut. He was also named aulic councillor, and was commanded by the king, Maximilian Joseph, to draw up a project of penal law for Bavaria. His position, however, was rendered painful and annoying by the jealousies and dislike of some of his fellow professors, who instigated the students to burlesque and ridicule him, and he resigned his chair. He was then called to Munich with the rank of privy referendary in the department of justice, and in 1808 was created privy councillor. Meanwhile appeared his *Critique on Kleinschrod's project of criminal law* (1804); and the practical reform of penal legislation in Bavaria was begun under his influence in 1806 by the abolition of torture. In 1808 appeared the first volume of his *Merkwürdige Criminalfälle*, completed in 1811—a work of deep interest for its application of psychological considerations to cases of crime, and intended to illustrate the inevitable imperfection of human laws in their application to individuals. In his *Betrachtungen über das Geschworenengericht* (1812) Feuerbach declared against trial by jury, maintaining that the verdict of a jury was not adequate legal proof of a crime. Much controversy was aroused on the subject, and the author's view was subsequently to some extent modified. His labors on the penal law being completed, the project was submitted to rigorous examination, and, receiving ultimately the royal sanction, was promulgated in 1813 as the Bavarian penal code. The influence of this code, the embodiment in logical form of Feuerbach's enlightened and humane views, was immense. It was at once adopted as the model and basis for new codes for Würtemberg and Saxe-Weimar; it was adopted in its entirety in the grand-duchy of Oldenburg; and it was translated into Swedish by order of the king. Several of the Swiss cantons reformed their codes in conformity with it. Feuerbach had also undertaken to prepare a civil code for Bavaria, to be founded on the Code Napoléon. This was afterwards set aside, and the Codex Maximilianus adopted as a basis. But the project did not become law. During the war of liberation (1813–1814) Feuerbach showed himself an ardent patriot, and published several political brochures, which, from the writer's position, had almost the weight of state manifestoes. One of these is entitled *Ueber Deutsche Freiheit und Vertretung Deutscher Völker durch Landstände* (1814). In 1814 Feuerbach was appointed second president of the court of appeal at Bamberg, and three years later he became first president of the court of appeal at Anspach. In 1821 he was deputed by the Government to visit France, Belgium, and the Rhine provinces for the purpose of investigating their juridical institutions; and in 1825 he published, as the fruit of this visit, his treatise *Ueber die Gerichtsverfassung und das gerichtliche Verfahren Frankreichs*. In his later years he took a deep interest in the fate of Kaspar Hauser, which had excited so much attention in Europe; and he was the first to publish a critical summary of the ascertained facts, under the title of *Kaspar Hauser: ein Beispiel eines Verbrechens am Seelenleben* (1832). Shortly before his death appeared a collection of his *Kleine Schriften* (1833). Feuerbach, still in the full enjoyment of his intellectual powers, died suddenly at Frankfort, while on his way to the baths of Schwalbach, May 29, 1833. In 1852 was published the *Leben und Wirken Ans. von Feuerbachs*, 2 vols., consisting of a selection of his letters and journals, with occasional notes by his fourth son Ludwig, the distinguished philosopher (noticed above). (W. L. R. C.)

[1] Unless in a will, in which case the obvious meaning of the testator will be adopted.

FEUILLETON (a diminutive of *feuillet*, the leaf of a book), a kind of supplement attached to the political portion of the French newspaper. Its inventor was Bertin the elder, editor of the *Débats*. It is not usually printed on a separate sheet, but merely separated from the political part of the newspaper by a line, and printed in smaller type. It consists chiefly of non-political news and gossip, literature and art criticism, a chronicle of the fashions, and epigrams, charades, and other literary trifles; and its general characteristics are lightness, grace, and sparkle. Some editors make use of the feuilleton as a separate sheet to float their journals into popularity by means of the instalments of an exciting novel. Something resembling the feuilleton is not uncommon in the newspapers of other nations, but none of these imitations possess the peculiar and distinctive excellences of the French supplement.

FEVER (from *ferveo*, to burn). This term, which may be defined as a condition of the body characterized by an increase in temperature, is used in medicine with a wide application. Fever is one of the most common accompaniments of diseases in general, and serves to make the distinction between *febrile* and *non-febrile* ailments. In many cases the fever must be regarded as only secondary to, and symptomatic of, the morbid state with which it is found associated. But there is a large class of diseases in which fever is the predominant factor, and which, although differing widely among themselves as to their characters and pathological manifestations, are believed to arise from the introduction into the system of something of the nature of a poison, upon which all the morbid phenomena depend. To such diseases the term primary or specific fevers is applied.

In considering the general subject of fever regard must be had in particular to the two main features of the febrile process,—viz., the abnormal elevation of temperature, and the changes affecting the tissues of the body in reference thereto. Indeed, the two points are inseparably associated.

The average heat of the body in health ranges between 98·4° and 99·5° F. It is liable to slight variations from such causes as the ingestion of food, the amount of exercise, and the temperature of the surrounding atmosphere. There are, moreover, certain appreciable diurnal variations, the lowest temperature being between the hours of 1.30 and 7 A.M., and the highest between 4 and 9 P.M., with trifling fluctuations during these periods.

The development and maintenance of heat within the body is generally regarded as depending on the destructive oxidation of all its tissues, consequent on the changes continually taking place in the processes of nutrition. In health this constant tissue disintegration is exactly counterbalanced by the introduction of food, while the uniform normal temperature is maintained by the due adjustment of the heat thus developed, and the processes of exhalation and cooling which take place from the emunctories of the body, particularly the lungs and skin. In the febrile state this relationship is no longer preserved, the tissue waste being greatly in excess of the food supply, while the so-called law of temperature is in abeyance. In this condition the body wastes rapidly, the loss to the system being chiefly in the form of nitrogen compounds (urea, etc.). The extent of this loss has been made the subject of research by many authorities, more particularly by Dr. Senator, whose general conclusion is that in the early stage of fever a patient excretes about three times as much urea as he would do on the same diet if he were in health—the difference being that in the latter condition he discharges a quantity of nitrogen equal to that taken in in the form of food, while in the former he wastes the store of nitrogen contained in the albumen of the tissues and blood corpuscles. The amount of fever is estimated by the degree of elevation of the temperature above the normal standard. When it reaches as high a point as 106° F. the term hyperpyrexia (excessive fever) is applied, and is regarded as indicating a condition of danger; while if it exceeds 107° or 108° for any length of time, death almost always results. Occasionally in certain fevers and febrile diseases the temperature may attain the elevation of 110°–112° prior to the fatal issue.

The clinical thermometer now in general use furnishes the physician with the means of estimating accurately the temperature and tracing its fluctuations, while the information it affords serves in many cases to indicate the particular form of fever, even at an early stage, as well as to prognosticate its probable result.

The leading general symptoms characteristic of the febrile state are certain phenomena connected with its onset, accession, and decline, necessarily modified in degree by the form the fever assumes, and by its attendant complications. The commencement is usually marked by a rigor or shivering, which may only exist as a slight but persistent feeling of chilliness, or, on the other hand, be of a violent character, and, as occasionally happens with children, find expression in the form of well-marked convulsions. Although termed the *cold stage* of fever, the temperature of the body in this condition is really increased. There are besides various accompanying feelings of illness, such as pain in the back, headache, sickness, thirst, and great lassitude. In all cases of febrile complaints it is of importance for the physician to note the occurrence of the first rigor, which in general fixes the beginning of the attack. This stage is soon followed by the full development of the febrile condition, the *hot stage*. The skin now feels hot and dry, and the temperature, always elevated above the normal standard, will often be found to exhibit diurnal variations corresponding to those observed in health,—namely, a rise towards evening, and a fall towards morning. There is in general a relative increase in the rate of the pulse and the number of respirations. The tongue is dry and furred; the thirst is intense, while the appetite is gone; the urine is scanty, of high specific gravity, containing a large quantity of solid matter, particularly urea, the excretion of which is, as already stated, remarkably increased in fever; while, on the other hand, certain of the saline ingredients, such as the chlorides, are often diminished. The bowels are in general constipated, but they may be relaxed, as is often the case in typhoid fever. The nervous system participates in the general disturbance, and sleeplessness, disquietude, and delirium, more or less violent, are common accompaniments of the febrile state. The waste of the muscles and corresponding loss of strength is very marked, and continues even although considerable quantities of nutriment may be taken.

The decline of the fever takes place either by the occurrence of a *crisis* or sudden termination of the symptoms, often accompanied with some discharge from the body, such as profuse perspiration, copious flow of thick urine, and occasionally diarrhœa, or by a more gradual subsidence of the febrile phenomena, or, as it is technically termed, a *lysis*. On the other hand, death may result either from hyperpyrexia or from gradual exhaustion, the patient often passing into the *typhoid state* (a condition of extreme prostration of the physical powers, with which are associated low delirium and coma, and which is an occasional mode of death in all acute diseases); or the fatal event may occur suddenly from syncope after slight exertion, in which case it is believed to be due to a softened state of the substance of the heart, one of the known accompaniments of fever.

Certain well-marked types of fever are recognized, these being determined by the clinical history and peculiar character and sequence of the symptoms.

The term *continued fever* is applied to those forms in which the febrile temperature persists for a more or less definite period, uninterrupted by any distinct intermission till the crisis is reached. To this type belong simple continued fever or febricula, typhus and typhoid fevers, and the eruptive fevers or exanthemata,—viz., small-pox, measles and scarlet fever. *Relapsing fever* is a form of continued fever, the chief characteristic of which is the occurrence in about a week after the crisis of a distinct relapse and repetition of all the symptoms. Occasionally second and third relapses take place.

The term *remittent* is applied to those forms of fever the course of which is interrupted by a short usually daily diminution of the febrile phenomena, followed by a recurrence of all the symptoms. Such fevers are chiefly met with in tropical climates, but occasionally continued fevers assume this form, particularly in children. The condition known as *hectic fever*, which occurs in the course of wasting diseases, is markedly remittent in its course.

In *intermittent fever* or *ague* there is a distinct periodic subsidence of the symptoms, which, according to its duration, characterizes the variety as *quotidian* (where the paroxysm recurs in 24 hours), *tertian* (in 48 hours), *quartan* (in 72 hours). Intermittent fevers are most common in the tropics, and are believed to be due to malarial poisoning.

The term *malignant* is employed to describe forms of fever in which the blood appears to undergo rapid deteriorating changes, sometimes designated blood-poisoning. Yellow fever may be said to belong to this category, and the continued fevers, more especially typhus and the exanthemata, occasionally assume a malignant form from the beginning. The chief forms of fever will be found described in detail under separate headings.

With respect to the treatment of the febrile condition in general, it may be remarked that modern therapeutics have furnished several methods of great importance and efficacy. It will be sufficient to refer to two of these,—namely, the external application of cold, and the administration of antipyretic remedies or febrifuges. The former of these methods is accomplished by means of baths in which the fever patient is placed, the water being somewhat below the febrile temperature, and gradually cooled down by the addition of cold water till a temperature of from 60°–70° is reached. This process, when continued for only a short time and frequently repeated, has been found to yield most valuable results in many instances of high temperature, both in continued fever and in such febrile ailments as acute rheumatism. The relief to the patient is remarkable, the body rapidly parting with its heat, and the effect usually continues for hours. The explanation suggested by Professor Binz is that "in fever the vessels of the skin are generally much contracted. The cool water acts as a strong stimulant on them, and causes a somewhat stronger contraction to take place, but this is only of short duration. Relaxation for a longer time is the necessary consequence. The hitherto bloodless and dry skin becomes filled and moist, and thus the irradiation of warmth goes on. The cooler the bath the longer it lasts."

Certain drugs possess the power of reducing the heat of fever, and are now largely employed for this purpose. The most important of these is quinine, which, when administered in large doses (gr. x.–xxx.), has a marked effect in lowering the febrile temperature, and, if repeated, of keeping it down. It has been supposed that this effect of quinine is due to its action as an antiseptic upon the poison in the blood giving rise to the fever; but there seems a greater degree of probability in the view that it acts as an antitriptic by retarding those excessive tissue changes with which the development of heat is undoubtedly connected. This opinion is strengthened by the fact that after the administration of quinine the amount of urea discharged from the body is greatly diminished. It is said that quinine acts best at those periods of the day when the febrile temperature is inclined to undergo slight remission. Many other substances are used for their antipyretic action, among which may be mentioned digitalis, aconite, salicin, salicilic acid, etc. Alcohol is strongly recommended by some physicians for this purpose, but while its effect in large doses is no doubt to lower the temperature, its extensive employment in fever is objectionable on many important grounds. (J. O. A.)

FEYDEAU, Ernest-Aimé (1821–1873), a French author, was born in Paris, March 16, 1821. He began his literary career in 1844, by the publication of a volume of poetry of that mediocre quality which in poetry is fatal. Either the partial failure of this literary effort, or his marriage soon afterwards to a daughter of the economist Blanqui, caused him to forsake for a time the vocation of letters, and to devote his ambition to exchange transactions; but the study of archæology gradually supplanted his interest in speculation, and he was finally confirmed in his original choice of a literary profession by the remarkable success which attended the publication, in 1858, of his novel *Fanny*, a success due chiefly to the cleverness with which it depicted and excused the corrupt manners of a certain portion of French society. *Fanny* was followed in rapid succession by a series of fictions, in which immorality was gilded with the same alluring glitter, but, wanting the attraction of novelty, they failed to produce such a marked impression as their predecessor; and as their interest depended little on the portrayal of any but the lower traits of character, and chiefly on the description of intrigues, they were read and admired only within a limited circle. Besides his novels Feydeau wrote several plays, none of which, however, attained much popularity; and he is also the author of *Histoire générale des usages funèbres et sépultures des peuples anciens*, 3 vols., 1857–61; *Le Secret du Bonheur* (sketches of Algerian life), 2 vols., 1864, English translation, 2 vols., 1867; and *L'Allemagne en 1871*, Paris, 1872, a clever caricature of German life and manners, but characterized in many places by a somewhat *blasé* tone, and disfigured here and there by bitterness of feeling. He died at Paris, October 28, 1873.

See Sainte-Beuve, *Causeries du Lundi*, vol. xiv., and Barbey d'Aurevilly, *Les œuvres et les hommes au XIX*^{e} *siècle*.

FEZ, one of the chief cities in the empire of Morocco, into which kingdom it was incorporated in the year 1548. It is situated in 34° 6′ 3″ N. lat. and 4° 58′ 15″ W. long., being about 197 miles N.E. of Morocco, 100 miles E. from the Atlantic, and 85 miles S. of the Mediterranean.

The city is beautifully situated on the slopes of a pear-shaped valley, through which flows the Wad-el-Jubar (or River of Pearls). The stream is fordable throughout, and is an affluent of the Wad-el-Sebu, which it joins about six miles to the north of the town. The Wad-el-Jubar divides the city into two quarters, the ancient town (Fas-el-bali) on the right bank, and the new (Fas-el-djedid) on the left.

Like many Oriental cities, Fez from a distance is a peculiarly striking looking place. It stretches out between low hills, crowned by the ruins of ancient fortresses; and from the turreted walls stand out in bold relief countless domes, minarets, and flat-roofed houses. The old battlemented wall, which still surrounds the place, though falling into decay, is yet flanked by strong masonry towers. The surrounding country is well cultivated. In some places the view is marvellous. The whole neighborhood seems covered with ruined buildings of every sort,—cells of recluses, broken columns, massive stone aqueducts, dome-like tombs, dilapidated forts, and ruined houses. Except on the south side the city is surrounded by hills interspersed with groves of orange, pomegranate, and various fruit trees, and large olive gardens.

The interior of the city is far from pleasing; the walls are lofty, and the streets are narrow and dirty.[1] In the old town, where is the chief emporium of trade, there is one long narrow street running the entire length of the town. It is irregularly paved with round pebbles about the size and shape of a cocoa-nut; these worn smooth by the tread of slippered feet are sore stumbling blocks to the few equestrians who chance to ride through the town. Compared to its fellows this is a wide street,—that is, it varies from 6 to 9 feet in breadth.

The tradesman usually sits cross-legged in a corner of his shop, with his goods so arranged that he can reach them without moving. As a rule, men of a trade congregate together, using the cellars underneath the shop as working places. No stock of goods is kept on hand; they are only made to order. The houses generally consist of two or three stories, with a trellis-work veranda on the roof. They are lighted with wooden gratings in the side streets. The windows all look into the courtyards, so that the traveller sees only the gloomy prospect of a lofty blank wall.

In olden times Fez was the great seat of learning in western Africa. Leo Africanus states in his work that there were not only 700 mosques, but a large university, numerous theological schools, and one of the finest libraries in the world. Now, however, all that is changed. Dr. Leared, who visited the city in 1877, endeavored in vain to gain access to some small collections of ancient books and manuscripts in connection with the mosques. The two chief mosques are the Caroubin, which is very large, and is said to contain a glass lustre holding 500 lamps, the spoil of some Christian church, and one named after Edris, the reputed founder of the city. The latter is a place of refuge for criminals, and the former has a special court for women to pray in—a most unusual thing in mosques. The palace gardens are fairly well kept; one of them, a beautifully wooded plot of ground on the banks of the river, contains some magnificent myrtles, rising to a height of 40 feet, with trunks like forest trees, and there are fruit and other trees in great variety. The palace, called Lallah Almina, built as usual of a mixture of clay and lime, is situated about two miles from the town; the courtyard, which is 100 paces long by 50 wide, is paved with highly glazed and very effectively colored tiles. This palace is said to have been built by Christian slaves, among whom were many English captives.

As a commercial town Fez is a great dépôt for the trade of Barbary, where also are collected wares brought from the east and south by caravans. The chief exports are almonds, gums, raisins, dates, caraway seeds, anise seed, citrons, capers, olive oil, honey, tallow, hides, tanned leather, ostrich feathers, lead, some gold, ivory, and gold dust, silken goods (such as bright-colored scarfs, turbans, and sashes), coarse linen, carpets, and saddlery. The "fez," or national head-dress of the Turks, is largely made. Until recent times, the city had a monopoly of the manufacture, for it was supposed that the dye which imparts the peculiar dull crimson hue of these skull-caps could not be obtained elsewhere; now, however, they are manufactured both in France and in Turkey. The dye is obtained from the juice of a small berry which grows in large quantities in the immediate neighborhood of the town, and is also extensively used in the tanning of morocco leather, one of the chief articles of export. Some gold work is made, the precious metal being brought from the interior of Africa by caravans which trade regularly with Timbuctoo. These start in the spring and autumn, and are usually about 140 days on the journey, of which only 54 are actually spent in marching. The merchants of Fez send by this means to the cities in the interior of Africa various articles of European manufacture and foreign produce, linens, muslins, fine cloths, silks, beads, brass nails, coffee, tea, and sugar, and in return they receive, gums, gold, elephants' tusks, ambergris, ostrich feathers, and slaves.

---

[1] In a paper published in the *Medical Times and Gazette* of July 28, 1877, a correspondent (Dr. Leared) writes—"If there is any truth in the influence of sanitary arrangements on the public health, how is it that health is preserved at all in Moorish towns? Take for example this capital. Fez is a town of about 45,000 inhabitants, surrounded by high walls. So narrow are the streets that in many of them it would be impossible for two people to walk abreast. Even the principal streets in which business is conducted are not more than ten feet wide. Owing to the height of the houses, many of which are of three stories, and the practice of covering the street on a level with the first story with reed roofs and often with vines, the rays of the sun never reach the streets except here and there in some more open spots. The consequence of this is that the inhabitants of Fez, hardly ever exposed to the sun, are a comparatively light-complexioned race of Moors; many indeed present a pallid etiolated appearance. The shops are mere cells placed about four feet from the ground, and in these the owners sit crouched up the whole day waiting for customers. The walls of the houses and shade roofs spoken of are covered with dust and festooned with cobwebs. The streets are rarely swept, and bad smells are prevalent. It is noteworthy, however, that one never experiences the smell of sewage. The reason is not far to seek. Fez, like other Moorish towns, possesses a system of drains, and an abundant and continuous water supply. Every house of any pretension is provided with a fountain in its own courtyard, by which the drains are constantly flushed. Moreover, there is no communication between the streets and the sewers. The surface water finds its way out of the streets by other channels. The closet is usually placed just inside the street entrance of the dwelling-houses, and too often makes its presence known by a vile smell. But it is no doubt owing to the abundance of water that the bad effects of sewage fermentation are not severely felt, since the sewers open only into the houses. The drinking water of Fez is procured from a river which flows through the town, and which receives its drainage. The water almost invariably produces diarrhœa in strangers."

It is believed that Fez was built in the year 793, by a prince named Edris; and, having soon become a city of much importance, it rose to be the capital of the Mahometan states of western Africa. The Moors considered it the finest city in the world; and it is held in extreme veneration also by all Moslem inhabitants of Africa. Leo Africanus mentions it as one of the most famous resorts of pilgrims in the 16th century, as well as the principal Arabic university in the world. It is filled with tombs of holy men, which impart to it an air of sacredness. In the 10th century, when the road to Mecca was unsafe, pilgrimages were performed to Fez, instead of to the tomb of the prophet. Subsequently its schools of religion, philosophy, and astronomy enjoyed a great reputation in Africa and also throughout southern Europe, and were attended even by Christians. On the expulsion of the Moors from Spain, refugees of all sorts flocked to Fez, partly on account of the asylum it afforded as a sacred city. These bringing with them some knowledge of arts, sciences, and manufactures, for a time the city flourished; but the vices and traditional conservatism of the Moslem religion prevented permanent improvement, so that it gradually sank to the unknown and unimportant position it now occupies.

During the summer the heat is intense, but in winter the climate is excellent. Travellers differ much as to the number of inhabitants. Dr. Leared computes them at from 45,000 to 50,000, but without sufficient data. Berbers, Arabs, negroes, and Jews are the principal races dwelling in the city. The Jews suffer great persecutions and many indignities, but many of them contrive to amass money.

The best method of reaching Fez is from Tangier, the total distance being about 160 miles. The road, though a mere bridle path, is quite practicable for camels and horses. There are numerous towns and villages at suitable distances, which afford convenient halting-places for travellers.

Authorities.—Leo Africanus, Barth, Rohlfs, Edmondo de Amicis, Dr. Vogel, and Dr. Leared. (C. B. N.)

FEZZAN (the ancient *Phazania*, or country of the Garamantes), a country of the Sahara region of North Africa, forming a "kaïmakamlik" of the Ottoman vilayet of Tripoli, extends 390 miles N. to S. from the town of Bonjem, lat. 30° 40′ N., to Bir Omah, on the route from Murzuk to Bornu, in lat. 24° 10′ N.; and 420 miles E. to W. from the Akakus Mountains near Ghat in long. 10° 30′ W. to the village of Wau-Squair in long. 18° 20′ W. Its ill-defined limits run from Bonjem, within 50 miles of the Mediterranean on the north, south-westward by the Bir-el-Hassi to the Akakus range east of Ghat, thence eastward to the Bir Omah south of the village of Tejerri, from that to Wau-Squair or Wau-Namus at its south-eastern corner, and thence northward past Zella to Bonjem, embracing an area of about 156,000 English square miles, or nearly three times the extent of England.

The general form of the country is determined by the ranges of hills called the Jebel-es-Sôda or Black Mountain, and the Haruj-el-Aswad or Black Haruj, which cross it along the parallel of 28° N., forming the northern edge of a broad desert plateau and the water-parting of the Mediterranean drainage slope, and shutting off the northern region from the depressions in which lie the oases of Fezzan proper in the south.

The Jebel-es-Sôda is described by M. Duveyrier as an isolated volcanic mass in the midst of a *hammada* or bare desert plateau of white limestone. Its length E. to W. is about 170 miles. At a point near the pass by which M. Duveyrier crossed it, a summit reaches a height of 2415 feet; where Rohlfs (*Quer durch Afrika*, Leipsic, 1874) passed over it between Tripoli and Murzuk he found its height to be 2982 feet. The volcanic mass of the Haruj continues the line of the Sôda in a S. E. direction for about 150 miles, and is crossed obliquely by the caravan routes from Fezzan to Egypt. Where Von Beurmann crossed the Haruj on the route from Zella to Murzuk he estimates its height at 1660 feet. The plateau of which these ranges mark the northern edge appears to be a continuation of the great desert plateau of Tripoli called the Hammada-el-Homra, and to have a general width of about 70 miles; where it is crossed on the western route over the Sôda it is described as shingly broken table-land, scattered over with large sandstone blocks; in the neighborhood of the Haruj on the east it presents a series of ridges running in different directions 8 to 12 feet above the intermediate land. The wadis or periodically filled rain-channels which drain northward from these heights are for the most part tributaries of the Wadi-Um-el-Cheil, which is called Wadi Bel where it opens on the coast of the greater Syrtis, and of the Wadi Tamet east of the former.

The southern edge of the plateau behind the Sôda descends to the Wadi-e-Shati running east and west; then follows a latitudinal belt of about 70 miles in average width, occupied by the sand dunes of Edeyen[1] which run across the frontier from the north of the Tuareg plateau in the west, and in the east by *Serir*, the name applied to districts which differ from the hammada or true plateaus, in being less elevated and everywhere covered with coarse gravel or rounded water-worn stones, in contrast to the sharply broken blocks scattered on the higher table-lands. To this follows southward the narrower belt called the Hammada of Murzuk, of inconsiderable elevation, marked out on the north side by the Amsak ridge which falls to the Wadi-el-Gharbi and its continuation the Wadi-e-Sherki at its base, and which descends on the south to the line of *Hofra*, or slight depressions in which lie the oasis groups of Murzuk, Zuila, and Wau. Along the northern side of the Wadi-e-Sherki and Wadi-el-Gharbi, about 60 miles N. W. of Murzuk, lie the celebrated Trona lakes of Fezzan, which were first described by Dr. Vogel. They are situated in a desert of drift sand in which the camels sink up to their bellies; one of them, the Bahr-el-Daud (Dauda = "worm"), contains the remarkable shrimp noticed below. In general the surface of Fezzan does not vary greatly in elevation; its numerous wadis do not lie much below the level of the *Serir;* the height of Murzuk, for example, is estimated by Rohlfs at 1804 feet, or little below the general level of the hammada in the north.

Climate.—The average temperature of Murzuk was found by Rohlfs to be 70° F., or 6° lower than that of Ghadames on the borders of western Tripoli. This difference he accounts for by the greater winter cold, for the heat of summer is probably greater here than in Tripoli; and his meteorological tables show such low temperatures as 25° F. at sunrise on the 20th of December, or 23° F. on the 30th of January, the thermometer having fallen below the freezing point 24 times within three months. As in all the rest of the desert, the climate is a very regular one, and is in general healthy, the dryness of the air in summer making the heat more bearable than on the sea coast, where the moisture of the atmosphere hinders evaporation from the skin. Although Fezzan does not lie within the zone of the tropical rains, and scarcely touches the limit of the winter rains supplied by the Mediterranean, it is visited at rare intervals by showers from the south. An almost perpetual blue sky overhangs the desert, and the people of Fezzan are so unaccustomed to and so ill-prepared for wet weather that, as in Tuat and Tidikelt, they pray to be spared from rain. They are not dependent upon it, for water is found almost everywhere at small depths, and little trouble is required to draw it from wells worked by men or camels for the purposes of irrigation; the palm groves, indeed, require no artificial watering, since their roots strike deep enough to reach the water-bearing stratum.

---

[1] "Edeyen" in Temâhag signifies dunes.—Duveyrier.

Products.—In the oases and cultivated spots of Fezzan there are generally five grain harvests in the year: in the winter months wheat and barley are sown, and in spring, summer, and autumn the various kinds of durra, especially *ksob* and *gafoli.* Ksob, first sown in March, is planted and reaped four times successively, although the last harvest in December does not ripen, so that it is used only as fodder for cattle. From year's end to year's end all kinds of vegetables could be produced, but only a few sorts, such as melons and cucumbers in summer, turnips and tubers in autumn, beans in winter, etc., are grown. Among other cultivated plants are tobacco (small and bad) and cotton. The latter flourishes, is perennial for six or seven years, and gives large pods of moderate length of staple. Olives, figs, and almonds are the chief fruits, besides the date, which is the great wealth of the land. The number of sorts of date-palm found in the oases is very large: in that of Murzuk alone more than 30 varieties are counted, the most esteemed being named the Tillis, Tuati, and Auregh. In all Fezzan the date is the staple food, not only for men, but for camels, horses, and dogs. Even the stones of the fruit are softened and given to the cattle. The huts of the poorer classes are entirely made of date-palm leaves, and the more substantial habitations consist chiefly of the same material. The produce of the tree is small, 100 full-grown trees yielding only about 40 cwts. of dates, worth about 30s. at Murzuk, and about four times that sum at Tripoli. They may generally be preserved about two years.

Domestic animals include only the camel (in two varieties, the Tebu or Sudan camel and the Arabian, differing very much in size, form, and capabilities), domestic fowls, and pigeons,—for the few horses, perhaps 50 in all Fezzan, and the miserable cattle, sheep, and goats imported, scarcely deserve mention. There are no large carnivora in Fezzan; even the hyena and jackal are absent. In the uninhabited oases gazelles and antelopes are occasionally found, but they are by no means abundant. Among birds are sparrows, swallows, ravens, falcons, and vultures; in summer wild pigeons and ducks are numerous, but in winter they seek a warmer climate. There are no remarkable insects or snakes. A species of *Artemia* or brine shrimp, about a quarter of an inch in length, of a color resembling the bright hue of the gold fish, is fished for with cotton nets in the Bahr-el-Daud before noticed, and, mixed with dates and kneaded into a paste, which has the taste and smell of salt herring, is considered a luxury by the people of Fezzan.

People.—The inhabitants of Fezzan are undoubtedly a mixed people, derived from the surrounding Teda and Bornu on the south, Tuareg of the plateaus on the west, Berbers and Arabs from the north. In color the people vary from black to pure white, but the prevailing hue of skin is a Malay-like yellow, the features and woolly hair being negro. The chief languages in use in Fezzan are, first, the Kanúri or Bornu language, which is spoken by little children before they learn Arabic, and, secondly, Arabic itself. Many understand Targish, the Teda, and Haussa languages. If among such a mixed people there can be said to be any national language, it is that of Bornu, which is most widely understood and spoken. The people of Sokna, north of the Jebel-es-Sôda, have a peculiar Berber dialect which Rohlfs found to be very closely allied to that of Ghadames. The natives of Fezzan are mild and conciliatory. As soon as one has passed the frontier of their country there is no more need to fear robbers; and this is the more remarkable since Tebus, who bear a thievish character in their own country, are very numerous. The men wear a haik or barakan like those of Tripoli, and a fez; short hose, and a large loose shirt called mansaría, with red or yellow slippers, complete their toilet. Yet one often sees the large blue or white *tobe* of Sudan and Bornu, and the *litham* or shawl-muffler of the Tuareg, wound round the mouth to keep out the blown sand of the desert. The women, who so long as they are young have very plump forms, and who are generally small, are more simply dressed, as a rule, in the barakan, wound round their bodies; they seldom wear shoes, but generally have sandals made of palm leaf. Like the Arab women they load arms and legs with heavy metal rings, which are of silver among the more wealthy; a single one of these rings sometimes weighs a French pound. The hair, thickly greased with butter, soon catching the dust, which forms a crust over it, is done up in numberless little plaits round the head, in the same fashion as in Bornu and Haussa. Little children run about naked until they attain the age of puberty, which comes very early, for mothers of ten or twelve years of age are not uncommon. Morality is at a very low stage, and the Fezzanians live a careless and happy life: every evening the sounds of music and dancing are heard.

The greater number live in huts of palm leaves, which are set up in the simplest manner; sometimes there is a small outer hut, which is plastered outside with mud, and serves as a winter dwelling; the two are then surrounded by a little palm fence. Towns, like the capital Murzuk, are either built of stone or of lumps of earth, as these may be convenient to the site, but beyond the town wall nothing is to be seen but palm huts.

The houses are generally one-floored, and have one or two rooms; sometimes there is a little courtyard; all are windowless, and have only a low doorway. Dates, as has been already noticed, form the staple food, and camels' flesh is only eaten in the towns. In Murzuk, on an average, three camels are slaughtered every day, with one sheep and one goat, which serve for the whole population without and within the walls of about 8000.

With regard to the numbers of the population of Fezzan the estimates of various travellers, in the absence of any trustworthy data, are widely different. Hornemann gives 70,000 to 75,000, Richardson only 26,000, Vogel 54,000. Rohlfs, who visited Fezzan at a prosperous period in 1865, believes the number 200,000 to be a moderate estimate; but Nachtigal, in 1870, thinks the whole population cannot exceed 40,000.

Government.—Fezzan is governed by a kaïmakam or lieutenant-governor, under the governor of the vilayet, province, or regency of Tripoli. At the time of Rohlfs's visit, the twelve mudirates or districts into which it had formerly been divided had been reduced to seven, but the Government was on the point of restoring the twelve districts, and of marking out their limits more distinctly. These districts are those of Bonjem, Sokna, Shati, Temenhint, Sebha, Wadi Sherki, Wadi Gharbi, Hofra, Sherguîa, Zella, Rhodua, and Gatron. All the mudirs are appointed by the kaïmakam of Fezzan, and deposed by him, if he should see fit, without reference to the mushir of Tripoli. The government is like that of the other Turkish provinces, practically absolute—for the will of the kaïmakam or the mudir is law—although in form constitutional, since a mijelis or council, in most cases only imaginary, is supposed to have a voice in the legislature.

Although the inhabited parts of Fezzan are naturally rich and fertile, the Turkish Government shows little skill in taking advantage of its resources. Under the most favorable circumstances the direct revenue of the country amounts to about 800,000 piastres, or about £72,000. Besides this, however, the Government receives a large sum from the sale of dates. Round Murzuk alone the number of palm trees belonging to the Government is reckoned by Rohlfs at a million. The direct receipts serve to salary the officials, including the kaïmakam and the troops, who, however, are not very regularly paid. Except it may be a present of slaves or other articles sent by the kaïmakam, not a farthing passes to Tripoli or Constantinople. On the contrary, all clothing, arms, even provisions, such as rice, sugar, and coffee for the soldiers, come from Tripoli or Stamboul. At the time of M. Duveyrier's visit the garrison of Murzuk consisted of 250 men of the regular Ottoman army (redîf), nearly all natives of Fezzan or negroes. At a later date Rohlfs found a garrison of 500 men.

Trade.—The commerce of Fezzan is unimportant, and has never been great. The country serves as a dépôt or middle station between Bornu and its surrounding negro states in the south and Tripoli and Egypt in the north, the caravan routes between these countries passing through it and centring at Murzuk. In later times the slave trade seems rather to have increased than diminished; the slaves are partly sent on to be sold in Tripoli and Tunis, partly by Aujila towards Egypt. The whole number that pass northward by the main caravan route from Kuka in Bornu is estimated at 10,000 annually.

Towns.—Murzuk, the present capital, lies in the western corner of the Hofra depression, in lat. 25° 55′ N. and long. 14° 10′ E. It was founded about 1310. One of the earliest buildings was the kasbah in the west of the town. The Turks have restored it as well as the wall of the town, which forms almost a perfect square. The town is cut in two by a wide street, the *dendal,* with shops on each side, which open at each end to the chief gates. The population within its walls is estimated by Rohlfs at 3000, excluding the garrison of 500 men; with its extra-mural huts it may have 8000 inhabitants. In its main streets a busy market is held in which provisions, meat, bread, and vegetables are bought; but it is insignificant in comparison with some of the other markets of the Sahara, such as that of Abuam in Tafilet. There are two Turkish coffee-houses which are busily frequented. Sokna, about midway between Tripoli and Murzuk, situated on a great gravel plain north of the Sôda range, seems to stand next to Murzuk in point of importance. Its population was estimated by Vogel at 2500. The other noteworthy centres of population are—Zuila and Temissa, on the route towards Egypt, E. N. E. of Murzuk; Germa, or Djerma, a walled place in the Wadi Sherki, 70 miles N. W. of Murzuk, near which was the ancient capital of Garama, which gave its name to the nation of the Garamantes; Gatron (1000 inhabitants) and Tejerri on the southern route towards Bornu, the latter being the frontier castle round which a village of low mud huts has grown up; Sebha in its oasis 90 miles N. N. E. of Murzuk; Fugháa on the plateau S. W. of the Haruj-el-Aswad; and Zella at the northern base of that range.

History.—The group of oases in the south of the present country of Fezzan represents the ancient Phazania, which has had for its capitals at successive periods Germa or Djerma under the Garamantes, Garama under the Romans, Trâghen under the Nesûr, Zuila under the conquering Arabs, and Murzuk under the dynasty of Uled Mohammed, under Abd-el-Jelîl, and under the Turks. The capital of the Garamantes is found under the name of Djerma-el-Kedîma, south of the modern Djerma (N. W. of Murzuk), in a sort of bay formed by the hill edge of Amsâk. The capital under the Nesûr is represented still by the ruins of the ancient castle of Trâghen (40 miles E. of Murzuk), Of the Garama of the Romans there remains now only one well-preserved monument, which is depicted in M. Duveyrier's work (*Les Touaregs du Nord*, Paris, 1864) situated amid ruins to the south of modern Djerma. Zuila, the Arab capital, remains as the chief place of the depression called the Sherguîa, east of the Murzuk, through which the most direct Egyptian route leads. Tradition and history are in accord in representing the most ancient inhabitants of the oases to have been the Berâuna, a name under which the Arabs group the negroes of Bornu as well as the Tebu. The oldest dynasty of the Berâuna was that of the Nesûr, originally from the Sudan. Its kings reigned at Trâghen, and were long in power before they were conquered and dethroned by an Arab tribe, that of Khormân, who reduced the people of Fezzan to a state of slavery. During this period of bondage, a sherif of Morocco, Sîd-el-Monteser-uld-Mohammed by name, on a pilgrimage to Mecca, passed through Fezzan. Yielding to the supplications of the people, on his return from the sacred city, he gathered a force of devotees and set out to liberate the Fezzanians. He defeated and expelled the Khormân Arabs, and, being elected sultan, founded the dynasty of Uled Mohammed. This dynasty, which reigned for about 550 years, advanced the interests of the country, and gradually extended its borders as far as Sokna in the north. The last of these sultans was killed in the vicinity of Trâghen in 1811 by El-Mukkeni, one of the lieutenants of Yousef-Pasha, the last sovereign of the independent Karamanli dynasty of Tripoli. El-Mukkeni now made himself sultan of Fezzan, and became notorious by his slaving expeditions into Nigritia, in which he advanced as far as Borgu, the Bahr-el-ghazal, and Bagirmi. In 1831, after the lieutenant of the Karamanli had reigned for 20 years, Abd-el-Jelîl, the celebrated chief of the Uled-Slimân Arabs, usurped the sovereign authority, and held it for ten years, during which time he maintained a contest which kept all Fezzan in a ferment. In 1841, Tripoli having meanwhile been erected into a province of the Ottoman empire, Bakir Bey was sent at the head of a column of troops to subjugate Fezzan. A battle took place at El-Bagla, not far from the sea, in which Abd-el-Jelîl was slain, and soon after this Fezzan was made a kaïmakamlik of the Ottoman empire.

From 1811 onward there is no doubt about the facts above enumerated. Previous to 1811, the documents preserved by the marabouts of Trâghen show that the dynasty of Uled-Mohammed occupied the throne of Fezzan for many centuries; but the date of its establishment, 1261, is perhaps questionable. M. Duveyrier adduces a number of proofs to show that the Berâuna above mentioned were identical with the Garamantes, so that it becomes almost a matter of certainty that at a very ancient date a negro civilization prevailed over the northern Sahara; and that this was very far advanced for its time is shown by the remains of remarkable hydraulic works, by tombs of distinct character, and by rock sculptures which record the chief facts of their history.

The most notable of the European travellers who have visited Fezzan, and to whose works the student is referred for more detailed information regarding it, are, taking them in the order of date, as follows:—Hornemann, 1798; Lyon, 1819; Denham, Clapperton, and Oudney, 1822; Richardson, 1845; Barth, 1850–55; Vogel, 1854; Duveyrier, 1859–61; Von Beurmann, 1862; Rohlfs, 1865; Nachtigal, 1870. (K. J.)

FIACRE, St., an anchorite of Irish descent, who was nobly born, but renounced his worldly advantages, and sailed to France to find a solitude where he might devote himself to fasting, prayer, and the practices of charity. On reaching Meaux he addressed himself to St. Faro, the bishop of the diocese, who assigned him a dwelling in the forest of Breuil, in the province of Brie. Here Fiacre constructed a cell, and at a little distance from it an asylum for the reception of the strangers and pilgrims whom the fame of his austere life and charitable deeds soon attracted in large numbers. He died about 670, and his day is the 30th of August. He was buried in the oratory constructed by himself; and on account of the miracles reported to be performed at his shrine, it was soon resorted to by pilgrims from all parts of France. The name *fiacre* was first given to French hackney-coaches because they were used to convey pilgrims from Paris to the shrine of this saint, and started from an inn which was known by the sign of St. Fiacre. A part of the remains of the saint were in 1568 transferred to the cathedral of Meaux, and in 1627 and 1695 the grand-dukes of Florence obtained other portions of them, but some, it is said, were still left in their old place of sepulture. St. Fiacre is patron of the province of Brie, and patron saint of gardeners.

FIARS PRICES, in the law of Scotland, are the average prices of each of the different sorts of grain grown in each county, as fixed annually by the sheriff, usually after the verdict of a jury; and they serve as a rule for ascertaining the value of the grain due to feudal superiors, to the clergy or to lay proprietors of teinds, to landlords as a part or the whole of their rents, and in all cases where the price of grain has not been fixed by the parties. It is not known when or how the practice of "striking the fiars," as it is called, originated. It probably was first used to determine the value of the grain rents and duties payable to the crown. In confirmation of this view it seems that at first the duty of the sheriff was merely to make a return to the Court of Exchequer of the prices of grain within their counties, the court itself striking the fiars; and from an old case it appears that the fiars were struck above the true prices, being regarded rather as punishments to force the king's tenants to pay their rents than as the proper equivalent of the grain they had to pay. Co-existent, however, with these fiars, which were termed sheriffs' fiars, there was at an early period another class called commissaries' fiars, by which the values of teinds were regulated. They have been traced back to the Reformation, and were under the management of the commissary or consistorial courts, which then took the place of the bishops and their officials. They have now been long out of use, but they were perhaps of greater antiquity than the sheriffs' fiars, and the model upon which these were instituted. In 1723 the Court of Session passed an Act of Sederunt for the purpose of regulating the procedure in fiars courts. Down to that date the practice of striking the fiars was by no means universal over Scotland; and even in those counties into which it had been introduced, there was, as the preamble of the Act puts it, "a general complaint that the said fiars are struck and given out by the sheriffs without due care and inquiry into the current and just prices." The Act in consequence provided that all sheriffs should summon annually, between the 4th and the 20th of February, a competent number of persons, living in the shire, of experience in the prices of grain within its bounds, and that from these they should choose a jury of fifteen, of whom at least eight were to be heritors; that witnesses and other evidence as to the price of grain grown in the county, especially since the 1st of November preceding until the day of inquiry, were to be brought before the jury, who might also proceed on "their own proper knowledge;" that the verdict was to be returned and the sentence of the sheriff pronounced by the 1st March; and further, where custom or expediency recommended it, the sheriff was empowered to fix fiars of different values according to the different qualities of the grain. It cannot be said that this Act has remedied all the evils of which it complained. The propriety of some of its provisions has been questioned, and the competency of the court to pass it has been doubted, even by the court itself. Its authority has been entirely disregarded in one county—Haddingtonshire—where the fiars are struck by the sheriff alone, without a jury; and when this practice was called in question, the court declined to interfere, observing that the fiars were better struck in Haddingtonshire than anywhere else. The other sheriffs have in the main followed the Act, but with much variety of detail, and in many instances on principles the least calculated to reach the true average prices. Thus in some counties the averages are taken on the number of transactions, without regard to the quantities sold. In one case, in 1838, the evidence was so carelessly collected that the second or inferior barley fiars were 2s. 4d. higher than the first. Formerly the price was struck by the boll, commonly the Linlithgowshire boll; now the imperial quarter is always used.

The origin of the word fiars is uncertain. Jamieson, in his *Dictionary*, says that it comes from the Icelandic *fe*, wealth; Paterson derives it from an old French word *feur*, an average; others connect it with the Latin *forum*. On the general subject of fiars prices see Paterson's *Historical Account of the fiars in Scotland*, Edin., 1852; Connell, *On Tithes*, vol. i. 431; Hunter's *Landlord and Tenant*, 4th ed., ii. 290.

FIBRES, TEXTILE, in their widest acceptation include all substances capable of being spun, woven, or felted; but there are many materials and preparations, which, though they can be and actually are woven, yet do not come within the range of fibres as technically understood. Thus metallic wires, although both spun into ropes and woven into wire-cloth for numerous purposes, are not generally reckoned among textile fibres, nor is horse-hair so regarded; it would, however, be difficult to frame a general definition that would not include such substances. Excluding these, and also leaving out of account fibres used solely as paper-making materials, there yet remain an enormous variety of materials more or less used and recognized as textile fibres. It is true that those of any considerable importance are comparatively few; but frequent additions are being made to the list of fibres of general utility; and improved methods of cultivation and preparation, as well as increased facilities of transport, tend to bring into general use numerous kinds which formerly may have had only local and limited applications. All textile fibres of recognized commercial importance will be found noticed in detail under their special headings; and it is only proposed here to classify commercial fibres generally, and to note some points of interest common to all.

Fibres of animal origin are few, but of the highest value, while vegetable fibres are of endless variety, and of the most diverse character as to qualities and general utility. Animal fibres may be comprehended under two heads, silk and wool, using the terms in an extended sense. Silk of commerce is obtained from several species of moth or silkworm; and as wool there may be enumerated that produced by the numerous varieties of sheep, the mohair and cashmere wool obtained from varieties of goat, camels' hair or wool, alpaca, and vicugna wool (see ALPACA, WOOLLEN MANUFACTURES, etc.). Several other animal fibres or hairs, and notably rabbit fur, are employed for felting, and the long fine hair of various animals has been occasionally woven into useful fabrics, without becoming recognized commercial staples. Animal fibres are closely related to each other in chemical composition, sharing their leading characteristics in common with all epidermic products, hair, horn, nails, feathers, etc. They belong to the nitrogenous or albuminoid group of substances, and are in composition intimately related to albumen, gelatin, and fibrin. They are insoluble in water or alcohol, but solutions of caustic alkalies cause them to swell up, and if boiled in these they dissolve with decomposition and the evolution of ammonia. Into the composition of wool sulphur enters, whereas the nitrogenous constituents of silk, which embrace albumen, gelatin, and a peculiar compound called fibroin, are free from that element. As is well known, these animal fibres yield a peculiar odor, like burning horn or feathers, on being ignited, and they carbonize with some difficulty only on the continued application of heat.

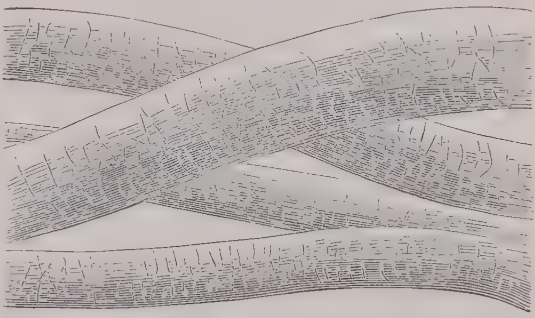

FIG. 3.—Fibre of Alpaca Wool.

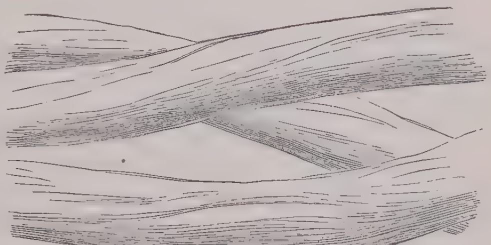

FIG. 4.—Bengal Silk Fibre.

Chemically, vegetable fibres show a similar intimate relation to each other, the basis of all being cellulose, a compound allied in ultimate composition to the carbohydrates, starch and sugar, but possessing very marked and distinctive characters. In particular, cellulose exhibits a remarkable indifference or resistance to the action of chemical reagents which affect allied substances and the bodies with which it is associated in growing plants. It is to this power of resisting change that its value for textile purposes is due, and on the same peculiarity is also based the ordinary method of separating fibres from other vegetable principles with which they are in general associated. Although cellulose is, however, practically unaffected by the ordinary solvents, water, alcohol, ether, benzol, and weak solutions of acids and alkalies even at high temperatures,

Name of Fibre.	Source.	Locality.	Remarks.
I. Seed Hairs—			
Cotton	*Gossypium barbadense*	U. S. America	See Cotton, vol. vi.
"	*G. conglomeratum*	West Indies.	
"	*G. herbaceum*	India.	
"	*G. acuminatum*	South America.	
"	*G. arboreum*	India.	
Silk Cotton	*Eriodendron anfractuosum*	Sunda	Used only for stuffing.
" (Ceiba)	*Bombax Ceiba*	West Indies	
"	*B. heptaphyllum*	Brazil	
"	*Eriodendron Saumama*	"	
"	*E. caribæum*	West Indies	
"	*Ochroma lagopus*	"	
"	*Chorisia speciosa*	"	
Vegetable Silk	*Beaumontia grandiflora*	India	Used only occasionally for stuffing.
"	*Strophanthus*	Senegal	
"	*Calotropis gigantea*	India	
"	*C. Hamiltonii*		
"	*Asclepias curassavica*	West Indies	
"	*A. volubilis*	"	
"	*A. syriaca*	North America	
"	*Marsdenia* (Sp.?)	"	
II. Bast Fibres of Dicotyledonous Plants—			
Flax	*Linum usitatissimum*	North Europe, etc	See Flax.
Hemp	*Cannabis sativa*	"	See Hemp.
Sunn Hemp	*Crotalaria juncea*	India	Used for cordage as a substitute for hemp.
Jubbulpore Hemp	*C. tenuifolia*	"	
Gambo or Ambaree	*Hibiscus cannabinus*	"	Resembling and used like jute.
Sida Fibre	*Sida retusa*, and other species	India and Australia	A cordage fibre.
Yercum or Ak	*Calotropis gigantea*	India	A valuable fibre, difficult of extraction.
Jetee	*Marsdenia tenacissima*	"	Similar to the above.
——	*Apocynum venetum*	South Russia, Siberia, and Central Asia	Prepared like flax, and much used locally.
——	*A. sibiricum*		
Nettle Fibre	*Urtica dioica*	Europe	Occasionally tried for textiles and paper.
"	*U. urens*		
Hemp Nettle	*U. cannabina*	Siberia	Used only in their native countries.
"	*U. argentea*	South Sea Islands	
"	*U. Japonica*	Japan	
Nilgherry Nettle	*U. heterophylla*	India and China	Cultivation restricted on account of the sting.
Alleghanian Nettle	*Laportea pustulata*	U. S. America.	
China Grass	*Böhmeria nivea*	Eastern Asia	Closely allied fibres. See Rhea.
Rhea or Ramie	*B. tenacissima*	"	
" "	*B. sanguinea*	Java	
Puya	*B. puya*	Nepal	
Jute	*Corchorus capsularis* *C. olitorius*	Bengal	See Jute.
Rai bhenda	*Abelmoschus tetraphyllos*	India	Used in India like jute, which they resemble.
Dhenros or Ochro	*A. esculentus*	"	
Porush	*Thespesia lampas*	"	Used like sunn hemp.
——	*T. populnea*	South America	Used for coffee bags in British Guiana.
Bun-ochra	*Urena sinuata*	Bengal.	
Mahwal	*Bauhinia vahlii*	India	Makes exceedingly tough, useful ropes.
Bun-raj	*B. racemosa*	"	
Narwali	*Cordia latifolia*	"	Used for coarse cloth, twine, and nets.
Sebestena	*C. angustifolia*	"	
Lime Tree Bast	*Tilia europæa*	Europe	Extensively used for mats, etc.
Tapa "	*Broussonetia papyrifera*	South Sea Islands	Beaten into native cloth.
Baobab "	*Adansonia digitata*	West Africa	Cordage and paper making.
Sterculia "	*Sterculia villosa*	India	Cordage.
Wawla "	*Holoptelea integrifolia*	West Indies	Not strong.
Warang "	*Kydia calycina*	"	Like lime bast.
Cuba "	*Hibiscus elatus*	"	For cigarette wrappers.
Rameta "	*Lasiosyphon speciosus*	Deccan	A very strong and almost colorless bast.
Chitrang "	*Sponia Wightii*	India	Like the above.
Lace Bark	*Lagetta lintearia*	West Indies	Ornamental purposes.
Pine Wool	*Pinus silvestris*	Germany	Surgical wadding.
III. Fibrous Bundles of Monocotyledonous Plants—			
Phormium, or New Zealand Flax.	*Phormium tenax*	New Zealand	See Phormium.
Manila Hemp	*Musa textilis*	East Indian Archipelago.	Ship cordage, etc.
Plantain Fibre	*Musa paradisiaca*, and other species.	Tropical regions	Cordage.
Bowstring Hemp	*Sanseviera zeylanica*	India, Ceylon, etc	A strong fibre.
Sisal or Grass Hemp	*Agave sisaliana*	Central America	Cordage, brush-making, etc.
Agave Fibre	*Agave americana*, and other species.	West Indies, etc	
Silk Grass	*Bromelia karatas*	South America	Cordage.
Pina Fibre	*Bromelia Pinguin*	Philippine Islands	Woven into extremely fine textures.
Vegetable Horsehair	*Tillandsia usneoides*	Central America, etc	Upholstery purposes, like horse-hair.
Vacoua or Screw Pine	*Pandanus odoratissimus*	Mauritius	Leaf strips used for matting, etc.
Panama Screw Pine	*Carludovica palmata*	Central America	Panama hats from leaf strips.
——	*Raphia ruffia*	Madagascar	Used for fine mats, etc.
——	*Chamærops excelsa*	China	
Crin Vegetal	*Chamærops humilis*	Algeria	Substitute for horse-hair in stuffing.
Tucum	*Astrocaryum vulgare*	Brazil	Fine twine for hammocks.
Tibisire	*Mauritia flexuosa*	"	Cordage.
Cabbage Palm	*Corypha australis*	Australia	Used for hat making.
Talipat	*Borassus flabelliformis*	India	Matting, baskets, etc., from leaf strips.
Kitul	*Caryota urens*	Ceylon	From base of leaf stalks, for brushes, cordage, etc.
Piassava	*Attalea funifera*	Brazil	
Gomuti	*Arenga saccharifera*	Java, etc	Native ship ropes.
Ratan	*Calamus rotang*, and other species.	East Indian Islands	Strips for chair seats; fibres for stuffing.
Coir	*Cocos nucifera*	Ceylon, etc	See Coir.

yet under certain circumstances its physical qualities of strength and elasticity may be very seriously damaged without any appearance of chemical change. Strong solutions of acids and alkalies, especially if aided with heat, act upon cellulose by first swelling up the fibres; this is followed by their complete solution, and ultimately a change of chemical constitution takes place, the cellulose being transformed into glucose or grape sugar. Oxydizing agents again exercise a destructive influence upon cellulose, a fact of great importance in connection with bleaching operations, which are all based upon the action of various oxidizing media. Cellulose is completely dissolved by ammoniacal solution of oxide of copper, and from its solution it may be precipitated chemically unchanged by treatment of the solution with acids.

The physical condition of fibrous substances is, however, for textile purposes, of much more importance than their chemical purity. The length and strength of the fibre, its fineness and elasticity, and its color are all considerations of the first importance. The period at which the fibre-yielding plants are collected, and the various processes through which all the raw materials, with the exception of cotton and other seed hairs, pass to free the fibres, exercise important influences on the strength, elasticity, and original color of the fibres. The almost invariable method by which vegetable fibres are freed from associated substances consists in retting or rotting, a process which will be fully described under FLAX.

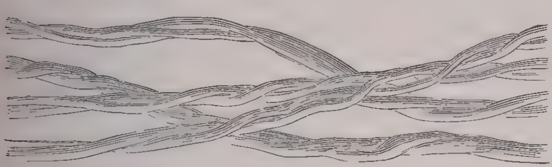

FIG. 5.—Fibre of Sea-Island American Cotton.

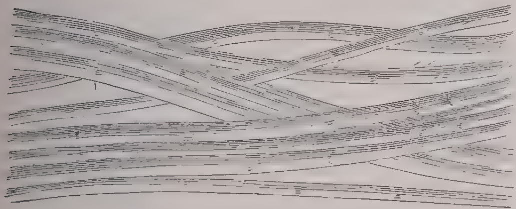

FIG. 6.—Cleaned Rhea Fibre.

In the accompanying table are embraced all the fibrous substances of vegetable origin which have hitherto been employed for textiles and cordage, etc., to any considerable extent. It is compiled from Dr. H. Müller's "Pflanzenfaser" in Hofmann's *Bericht über die Entwickelung der chemischen Industrie,*—a paper to which we owe other obligations.

The more closely vegetable fibres approximate to a condition of absolute purity, the greater becomes the difficulty of distinguishing them from each other by any chemical tests. As, however, more or less incrusting substance adheres to all bast fibres in their raw condition, they exhibit certain reactions by which, in that condition, they can be separately recognized, but such tests are of little practical value. More definite and important results can be obtained by microscopical examination, as certain peculiarities of minute structure are retained by fibres with great persistency. The microscopic distinction of allied fibres is, however, a difficult task, requiring much experience and discrimination. Cotton and other seed hairs, which consist of single elongated cells or tubes, are of course easily distinguished from other vegetable fibres which are composed of aggregated cells; and still more marked is the difference between vegetable fibres and wool and silk respectively. The accompanying woodcuts show the microscopic appearance of wool, silk, cotton, rhea, and flax fibres, magnified in each case 320 diameters. As wool, silk, and vegetable fibres present marked differences of chemical character, they can be readily recognized in any mixed fabric by appropriate tests. Thus aniline dyes, which communicate strong permanent colors to wool and silk, only produce on vegetable fibres a fugitive, easily-washed-out stain. Vegetable fibres in a mixed fabric may be distinguished by boiling a fragment of the material in a solution containing 10 per cent. of soda, whereby the animal fibres dissolve, leaving the vegetable fibres. By filtration and subsequent purifying of the undissolved remains, the proportion of vegetable fibre may be ascertained. The alkaline filtrate treated with acetate of lead gives a white precipitate for silk and black for wool. The sulphur contained in wool, from which silk is free, gives a ready means of distinguishing a mixture of these two fibres. In a solution of plumbate of soda wool becomes black, while silk is quite unaffected. (J. PA.)

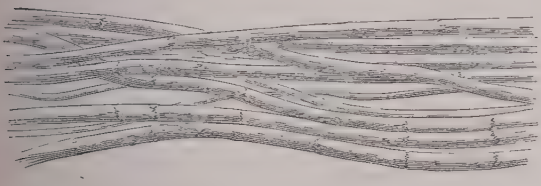

FIG. 7.—Fibre of Rough Russian Flax.

FIBRIN, or FIBRINE, is a member of the important group of albuminoid or proteinous substances which, embracing albumen, casein, gluten, and other allied compounds, constitute essential principles of animal and of the higher vegetable organisms. The substances are distinguished among themselves more by physical peculiarities and properties than by distinctions of chemical constitution, which, indeed, is so variable as to point to the conclusion that the various principles are not to be regarded as definite chemical compounds. In a physiological sense fibrin results from the union of two albuminoids which exist separately in the blood, fibrinogen and the fibrinoplastic substance. The body is most readily obtained by lashing blood-clot with a loose bundle of twigs, when the substance will attach itself to the twigs in a filamentous condition. On being purified by washing with water, it forms a soft elastic transparent or whitish mass of filaments, which have no tendency to cohere. When permitted to dry in the air it becomes a hard horny mass, with a yellowish or greenish tinge. Fibrin is quite insoluble in water, but boiled under pressure, or with long continued boiling, it dissolves with a change of its structure. It is unaffected by alcohol or ether, but in presence of dilute acids and weak alkalies it is gradually dissolved. Its average percentage composition is thus stated:—Carbon 52·6, hydrogen 7·6, nitrogen 17·4, oxygen 21·8, sulphur 1·2. The analogous product obtained from muscular tissue is termed syntonin. Vegetable fibrin is that portion of the nitrogenous constituents of cereal grains and similar seeds which is insoluble in alcohol. Fibrin, although a substance of the highest physiological interest, and of the utmost importance as a constituent of food, has hitherto, unlike albumen, casein, and gluten, found no special application as a separate industrial product.

FICHTE, JOHANN GOTTLIEB (1762–1814), one of the most eminent of modern German metaphysicians, was born at Rammenau in Upper Lusatia on the 19th May, 1762. His father, a ribbon-weaver in that village, was of Swedish origin, the first of the Fichte family having been a soldier in the army of Gustavus Adolphus, who was left wounded at Rammenau and settled there. All of the race were distinguished for piety, uprightness, and solidity of character. With these qualities Fichte himself combined a certain impetuosity of temper and impatience which were probably derived from his mother, a woman of somewhat querulous and jealous disposition. At a very early age the boy showed remarkable mental vigor and moral independence. A fortunate accident brought him under the notice of a neighboring nobleman, Freiherr von Miltitz, and was the means of procuring him a more excellent education than his father's circumstances would have allowed. By Von Miltitz he was placed under the care of Pastor Krebel at Niederau, who prepared him admirably for higher school instruction. After a short stay at Meissen he was then entered at the celebrated school or seminary at Pforta, near Raumburg. In 1780, after six years' residence at Schulpforta, Fichte, whose patron Von Miltitz had unfortunately died, entered the university of Jena as a student of theology. His means did not permit him to prosecute an uninterrupted course of study; he supported himself mainly by private teaching, and during the years 1784–1787 acted as tutor in various families of Saxony. In 1787, after an unsuccessful application to the consistory for some pecuniary assistance, such as was frequently given to poor students of theology at the Saxon universities, he seems to have been altogether driven to miscellaneous literary work. A tutorship at Zurich was, however, obtained in the spring of 1788, through his friend Weisse, and Fichte spent in Switzerland two of the happiest years of his life. He made several valuable acquaintances, among others Lavater and his brother-in-law Hartmann Rahn, to whose daughter, Johanna Maria, he became engaged before leaving Zurich in 1790.

Settling at Leipsic, Fichte still found himself without any fixed means of livelihood, and was again reduced to literary drudgery, writing tales, plays, and reviews for the popular magazines. In the midst of this distracting work occurred the most important event of his life, his introduction to the philosophy of Kant. That Fichte had been already interested in philosophico-theological questions we know, but up to this period his speculations had been but desultory. At Schulpforta he had read with delight Lessing's *Anti-Goeze*, and during his Jena student days had occupied himself with the difficult problem of the relation between philosophy and religion. The outcome of his speculations, as exhibited in the fragmentary *Aphorismen über Religion und Deismus* (unpublished, date 1790; *Werke*, i. 1–8), was a species of Spinozistic determinism, regarded, however, as lying altogether outside the boundary of religion. It is remarkable that even for a time should fatalism have been predominant in Fichte's reasoning, for in character he was throughout opposed to such a view, and, as he has said, "according to the man, so is the system of philosophy he adopts." With such half-formed opinions, Kant's philosophy was a new revelation. In particular, he seized upon the practical side, in which Kant works out his view of the absolute moral law as the essence of free intelligence. This doctrine lies at the root of all Fichte's after speculations; in fact his system is merely the rigidly consistent evolution of the true relation between reason as practical and reason as cognitive.

Fichte's *Letters* of this period sufficiently attest the influence exercised on him by the study of Kant. It effected a revolution in his whole mode of thinking; and so completely did the Kantian doctrine of the inherent moral worth of man harmonize with his own character, that from this time forward his life becomes one effort to realize and perfect a true philosophy, and to make its principles no mere theoretic axioms, but practical maxims. At first he seems to have thought that the best method for accomplishing his object would be to expound Kantianism in a popular, intelligible form. He felt, and rightly, that the reception of Kant's doctrines was impeded by the clumsy and scholastic phraseology in which they were stated. An abridgment of the *Kritik der Urtheilskraft* was begun, but was left unfinished.

The circumstances of Fichte's life had not improved. No opening had presented itself, and it had been arranged in the beginning of 1791 that he should return to Zurich and be married to Johanna Rahn. This plan was overthrown by a commercial disaster which severely affected the fortunes of the Rahn family. Fichte accepted a post as private tutor to the family of a nobleman in Warsaw, and proceeded slowly on foot to that town. The situation proved unsuitable; the lady as Kuno Fischer says, "required greater submission and better French" than Fichte could yield, and after little more than a fortnight's stay, Fichte set out for Königsberg, drawn thither by the desire to see Kant. His first interview with Kant was disappointing; the coldness and formality of the aged philosopher checked the enthusiasm of the young disciple, though it did not diminish his admiration and reverence. He resolved to bring himself before Kant's notice in a more effective manner by submitting to him some paper in which the principles of the Kantian philosophy should be applied. Such was the origin of the work, written in four weeks, the *Versuch einer Kritik aller Offenbarung* (Essay towards a Critique of all Revelation). The problem which Fichte dealt with in this essay was one not yet handled by Kant himself, and the relations of which to the critical philosophy furnished matter for considerable surmise. Indirectly, indeed, Kant had indicated a very definite opinion on theology: from the *Critique of Pure Reason* it was clear that for him speculative theology must be purely negative, while the *Critique of Practical Reason* as clearly indicated the view that the moral law is the absolute content or substance of any religion. A *critical* investigation of the notion of revealed religion, an examination of the conditions under which religious belief was possible, was still, therefore, an open problem. Fichte's essay was forwarded by him to Kant, who approved it highly, extended to the author a most warm reception, and exerted his influence to procure a publisher for the work. After some delay, consequent on the scruples of the theological censor of Halle, who did not like to see miracles rejected, the book appeared at Easter, 1792. By an oversight of the publisher, Fichte's name did not appear on the title page, nor was the preface given, in which the author spoke of himself as a beginner in philosophy. Considering then the principles applied and the results reached, it was not unnatural that outsiders should ascribe the work to Kant himself. The *Allgemeine Literatur-Zeitung* went so far as to say that no one who had read a line of Kant's immortal writings could fail to recognize the eminent author of this new work. The mistake was soon rectified by Kant himself, who publicly announced the true author, at the same time highly commending the work. By this fortunate error Fichte's reputation was secured at a stroke, and he soon reaped the benefits of fame.

The *Critique of Revelation* is deserving of particular notice, since it marks the culminating point of Fichte's Kantian period. The exposition of the conditions under which revealed religion is possible turns upon the absolute requirements of the moral law in human nature. Religion itself is the belief in this moral law as divine, and such belief is a practical postulate, necessary in order to add force to the law. It follows that no revealed religion, so far as matter or substance is concerned, can contain anything beyond this law; nor can any fact in the world of experience be recognized by us as supernatural. The supernatural element in religion can only be the divine character of the moral law. Now, the revelation of this divine character of morality is possible only to a being in whom the lower impulses have been or are successful in overcoming reverence for the law. In such a case it is conceivable that a revelation might be given in order to add strength to the moral law. Religion ultimately then rests upon the practical reason, and expresses some demand or want of the pure ego or human will. In this conclusion we can trace the prominence assigned by Fichte to the practical element, and the tendency to make the requirements of the ego the ground for all judgment on reality. It was not possible that having reached this point he should not press forward and leave the Kantian position.

Fichte's literary success was coincident with an improvement in the fortunes of the Rahn family. There seemed now no reason for delaying his marriage, which accordingly took place at Zurich in October, 1793. The remainder of the year he spent in retirement at Zurich, slowly perfecting his thoughts on the fundamental problems left for solution in the Kantian philosophy. During this period also he published anonymously two remarkable political works, *Zurückforderung der Denkfreiheit von den Fürsten Europa's*, and *Beiträge zur Berichtigung der Urtheile des Publicums über die französische Revolution*. Of these the latter is much the more important. The French Revolution seemed to many earnest thinkers the one great outcry of modern times for the liberty of thought and action which is the eternal heritage of every human being. Unfortunately the political condition of Germany was unfavorable to the formation of an unbiassed opinion on the great movement. The principles involved in it were lost sight of under the mass of spurious maxims on social order which had slowly grown up and stiffened into system. To direct attention to the true nature of revolution, to demonstrate how inextricably the right of liberty is interwoven with the very existence of man as an intelligent agent, to point out the inherent progressiveness of state arrangements, and the consequent necessity of reform or amendment, such are the main objects of the *Beiträge;* and although, as is often the case with Fichte, the arguments are too formal and the distinctions too wire-drawn, yet the general idea is nobly conceived and carried out. As in the *Critique of Revelation* so here the rational nature of man and the conditions necessary for its manifestation or realization become the standard for critical judgment.

Towards the close of 1793 Fichte received an invitation to fill the post of extraordinary professor of philosophy at Jena, vacant by the transference of Reinhold to Kiel. This chair, though not in the ordinary faculty had become, through Reinhold, the most important in the university, and great deliberation was exercised in selecting his successor. It was desired to secure an able exponent of Kantianism, and none seemed so highly qualified as the author of the *Critique of Revelation.* Fichte, while accepting the call, at first desired to delay entry on his duties for a year, in order to be more thoroughly prepared; but as this was deemed inexpedient, he rapidly drew out an introductory outline of his system for the use of his students, and began his lectures in May, 1794. His success was instantaneous and complete. The fame of his predecessor was altogether eclipsed; as Forberg writes, "Fichte is believed in as Reinhold never was. The students understand him even less than they did his predecessor, but they believe all the more earnestly on that account." Much of this success was undoubtedly due to Fichte's rare power as a lecturer. In oral exposition the vigor of thought and moral intensity of the man were most of all apparent, while his practical earnestness completely captivated his hearers. He lectured not only on philosophy to his own class, but on general moral subjects to all students of the university. These general addresses, published under the title *Vocation of the Scholar* (Bestimmung des Gelehrten), were on a subject very dear to Fichte's heart, the supreme importance of the highest intellectual culture and the duties incumbent on those who had received it. Their tone is stimulating and lofty.

The years spent at Jena were unusually productive; indeed, the completed Fichtean philosophy is contained in the writings of this period. A general introduction to the system is given in the tractate *On the Notion of the Theory of Science* (Ueber den Begriff der Wissenschaftslehre, 1794), and the theoretical portion is worked out in the *Foundation of the whole Theory of Science* (Grundlage der gesammten Wissenschaftslehre, 1794), and *Outline of what is peculiar in the Theory of Science* (Grundriss des Eigenthümlichen d. Wissenschaftslehre, 1794). To these were added in 1797 a *First* and a *Second Introduction to the Theory of Science*, and an *Essay towards a new Exposition of the Theory of Science.* The *Introductions* are masterly expositions. The practical philosophy, which was with Fichte the fundamental, was given in the *Grundlage des Naturrechts*, 1796, and *System der Sittenlehre*, 1798. The last is, we think, the most important of all Fichte's works; apart from it, his theoretical philosophy is unintelligible and absurd.

During this period of literary activity Fichte's academic career had been troubled by various storms, the last so violent as to put a close to his professoriate at Jena. The first of them, a complaint against the delivery of his general addresses on Sundays, was easily got over. The second, arising from Fichte's strong desire to suppress the *Landsmannschaften*, or students' orders, which were productive of much harm, was more serious. Some misunderstanding caused an outburst of ignorant ill-feeling on the part of the students, who proceeded to such lengths that Fichte was compelled to obtain leave to reside out of Jena. The third storm, however, was the most violent. In 1798 Fichte, who, with Niethammer, had edited the *Philosophical Journal* since 1795, received from his friend Forberg an essay on the "Development of the Idea of Religion." With much of the essay he entirely agreed, but he thought the exposition in so many ways defective and calculated to create an erroneous impression, that he prefaced it with a short paper *On the Grounds of our Belief in a Divine Government of the Universe*, in which God is defined as the moral order of the universe, the eternal law of right which is the foundation of all our being. Any other mode of existence must be denied to him. Against these papers the cry of atheism was raised, and the electoral Government of Saxony suppressed the *Journal* and confiscated the copies found in their universities, acts imitated by all the German states except Prussia. The duke of Saxe-Weimar, patron of Jena university, was almost ordered to reprove and dismiss the offenders. Fichte's defences (*Appellation an das Publicum gegen die Anklage des Atheismus*, and *Gerichtliche Verantwortung der Herausgeber der phil. Zeitschrift*, 1799), though masterly, did not make the matter easier for the court of Saxe-Weimar, who strongly wished to let the affair pass quietly, and an unfortunate letter, in which he threatened to resign in case of reprimand, turned the scale altogether against him. The court arbitrarily accepted his threat as a request to resign, passed censure, and extended to him permission to withdraw from his chair at Jena; nor would they alter their decision, even though Fichte himself endeavored to explain away the unfortunate letter.

Berlin was now the only town in Germany open to him. His residence there from 1799 to 1806 was only broken by the delivery of lectures during the summer of 1805 at Erlangen, where he had been named professor. Surrounded by friends including such men as Schlegel and Schleiermacher, he continued his literary work, perfecting and amending the *Wissenschaftslehre.* The most remarkable of the works from this period are—(1) the *Bestimmung des Menschen* (Vocation of Man, 1800), a book which, for beauty of style, richness of content, and elevation of thought, may be ranked with the *Meditations* of Descartes; (2) *Der geschlossene Handelsstaat*, 1800 (The Exclusive or Isolated Commercial State), a very remarkable treatise, intensely socialist in tone, and bitterly opposed to free-trade and competition, inculcating in fact organized protection; (3) *Sonnenklarer Bericht an das grössere Publicum über die neueste Philosophie*, 1801. In 1801 was also written the *Darstellung der Wissenschaftslehre*, which was not published till after his death. In 1804 a set of lectures on the *Wissenschaftslehre* was given at Berlin, the notes of which were published in the *Nachgelassene Werke*, vol. ii. In 1804 were also delivered the noble lectures on the *Characteristics of the Present Age* (Grundzüge der gegenwärtigen Zeitalters, 1804), containing a most admirable analysis of the Aufklärung, tracing the position such a movement of thought holds in the natural evolution of the general human consciousness, pointing out its inherent defects, and indicating as the ultimate goal of progress the life of reason in its highest aspect as a belief in the divine order of the universe. The philosophy of history sketched in this work has something of value with much that is fantastic and absurd. In 1805 and 1806 appeared the *Nature of the Scholar* (Wesen des Gelehrten) and the *Way to a Blessed Life* (Anweisung zum seligen Leben oder Religionslehre), the latter the most important work of this Berlin period. In it the union between the finite self-consciousness and the infinite ego or God is handled in an almost mystical manner. The knowledge and love of God is the end of life; by this means only can we attain blessedness (Seligkeit), for in God alone have we a permanent, enduring object of desire. The infinite God is the all; the world of independent objects is the result of reflection or self-consciousness, by which the infinite unity is broken up. God is thus over and above the distinction of subject and object; our knowledge is but a reflex or picture of the infinite essence. Being is not thought.

The disasters of Prussia in 1806 drove Fichte from Berlin. He retired first to Stargard, then to Königsberg (where he lectured for a time), then to Copenhagen, whence he returned to the capital in August, 1807. From this time till his death his only published writings are practical in character; not till after the appearance of the *Nachgelassene Werke* was it known in what shape his final speculations had been thrown out. We may here note the order of these posthumous writings as being of importance for tracing the development of Fichte's thought. From the year 1806 we have the remarkable *Bericht über die Wissenschaftslehre* (*Werke*, vol. viii.) with its sharp critique of Schelling; from 1810 we have the *Thatsachen des Bewusstseyns*, published in 1817, of which another treatment is given in lectures of 1813 (*Nachgel. Werke*, vol. i.). Of the *Wissenschaftslehre* we have, in 1812–13, four separate treatments contained in the *Nachgel. Werke.* As these consist mainly of notes for lectures, couched in uncouth phraseology, they cannot be held to throw much light on Fichte's views. Perhaps the most interesting are the lectures of 1812 on *Transcendental Logic* (*Nach. Werke*, i. 106–400).

From 1812 we have notes of two courses on practical philosophy, *Rechtslehre* (*Nach. Werke*, vol. ii.) and *Sittenlehre* (*Ib.*, vol. iii.). A finished work in the same department is the *Staatslehre*, published in 1820. The gives the Fichtean utopia or state organized on principles of pure reason; in too many cases the proposals are identical with principles of pure despotism.

During these later years, however, Fichte's energies were mainly occupied with public affairs. In 1807 he drew up an elaborate and minute plan for the proposed new university of Berlin. In 1807–1808 he delived at Berlin, amidst danger and discouragement, his noble addresses to the German people (*Reden an die Deutsche Nation*). Even if we think that in these pure reason is sometimes overshadowed by patriotism, we cannot but recognize the immense practical value of what he recommended as the only true foundation for national prosperity.

In 1810 he was elected rector of the new university founded in the previous year. This post he resigned in 1812, mainly on account of the difficulties he experienced in his endeavor to alter and amend the student life of the university.

In 1813 began the great effort of Germany for national independence. Debarred from taking an active part, Fichte made his contribution by way of lectures. The addresses on the idea of a true war (*Ueber den Begriff einer wahrhaften Kriegs*, forming part of the *Staatslehre*) contain a very subtle and admirable contrast between the positions of France and Germany in the war.

In the autumn of 1813 the hospitals of Berlin were filled with sick and wounded from the campaign. Among the most devoted in her exertions was Fichte's wife, who, in January, 1814, was attacked with a virulent hospital fever. On the day after she was pronounced out of danger Fichte was struck down by the same disease. His constitution, weakened by severe illness in 1808, was unable to withstand the attack. He lingered for some days in an almost unconscious state, and died on the 27th January, 1814.

The philosophy of Fichte, worked out in a series of writings, and falling chronologically into two distinct periods, that of Jena and that of Berlin, seemed in the course of its development to undergo a change so fundamental that many critics have sharply separated and opposed to one another an earlier and a later phase. The ground of the modification, further, has been sought and apparently found in quite external influences, principally that of Schelling's *Naturphilosophie*, to some extent that of Schleiermacher. But as a rule most of those who have adopted this view have done so without the full and patient examination which the matter demands; they have been misled by the difference in tone and style between the earlier and later writings, and have concluded that underlying this was a fundamental difference of philosophic conception. One only, Erdmann, in his *Entwicklung d. deuts. Spek. seit Kant*, § 29, seems to give full references to justify his opinion, and even he, in his later work, *Grundriss der Gesch. der Philos.* (ed. 3), § 311, admits that the difference is much less than he had at the first imagined. He certainly retains his former opinion, but mainly on the ground, in itself intelligible and legitimate, that, so far as Fichte's philosphical reputation and influence are concerned, attention may be limited to the earlier doctrines of the *Wissenschaftslehre.* This may be so, but it can neither be admitted that Fichte's views underwent radical change, nor that the *Wissenschaftslehre* was ever regarded as in itself complete, nor that Fichte was unconscious of the apparent difference between his earlier and later utterances. It is demonstrable by various passages in the works and letters that he never looked upon the *Wissenschaftslehre* as containing the whole system; it is clear from the chronology of his writings that the modifications supposed to be due to other thinkers were from the first implicit in his theory; and if one fairly traces the course of thought in the early writings, one can see how he was inevitably led on to the statement of the later and, at first sight, divergent views. On only one point, the position assigned in the *Wissenschaftslehre* to the absolute ego, is there any obscurity; but the relative passages are far from decisive, and from the early work, *Neue Darstellung der Wissenschaftslehre,* unquestionably to be included in the Jena period, one can see that from the outset the doctrine of the absolute ego was held in a form differing only in statement from the later theory.

Fichte's system is one absolutely refusing to be compressed with intelligibility. We shall here note only three points:—(*a*) the origin in Kant; (*b*) the fundamental principle and method of the *Wissenschaftslehre;* (*c*) the connection with the later writings. The most important works for (*a*) are the "Review of Ænesidemus," and the *Second Introduction to the Wissenschaftslehre;* for (*b*) the great treatises of the Jena period; for (*c*) the *Thatsachen des Bewusstseyns* of 1810.

(*a*) The Kantian system had for the first time opened up a truly fruitful line of philosophic speculation, the transcendental consideration of knowledge, or the analysis of the conditions under which cognition is possible. To Kant the fundamental condition was given in the synthetical unity of consciousness. The primitive fact under which might be gathered the special conditions of that synthesis which we call cognition was this unity. But by Kant there was no attempt made to show that the said special conditions were necessary from the very nature of consciousness itself. Their necessity was discovered and proved in a manner which might be called empirical. Moreover, while Kant in a quite similar manner pointed out that intuition had special conditions, space and time, he did not show any link of connection between these and the primitive conditions of pure cognition. Closely connected with this remarkable defect in the Kantian view,—lying, indeed, at the foundation of it,—was the doctrine that the matter of cognition is altogether *given,* or thrown into the *form* of cognition from without. So strongly was this doctrine emphasized by Kant, that he seemed to refer the *matter* of knowledge to the action upon us of a non-ego or Ding-an-sich, absolutely beyond consciousness. While these hints towards a completely intelligible account of cognition were given by Kant, they were not reduced to system, and from the way in which the elements of cognition were related, could not be so reduced. Only in the sphere of practical reason, where the intelligible nature prescribed to itself its own laws, was there the possibility of systematic deduction from a single principle.

The peculiar position in which Kant had left the theory of cognition was assailed from many different sides and by many writers, specially by Schultze (Ænesidemus) and Maimon. To the criticisms of the latter, in particular, Fichte owed much, but his own activity went far beyond what they supplied to him. To complete Kant's work, to demonstrate that all the necessary conditions of knowledge can be deduced from a single principle, and consequently to expound the complete system of reason, that is the business of the *Wissenschaftslehre.* By it the theoretical and practical reason shall be shown to coincide; for while the categories of cognition and the whole system of pure thought can be expounded from one principle, the ground of this principle is scientifically, or to cognition, inexplicable, and is made conceivable only in the practical philosophy. The ultimate basis for the activity of cognition is given by the will. Even in the practical sphere, however, Fichte found that the contradiction, insoluble to cognition, was not completely suppressed, and he was thus driven to the higher view, which is explicitly stated in the later writings, though not, it must be confessed, with the precision and scientific clearness of the *Wissenschaftslehre.*

(*b*) What, then, is this single principle, and how does it work itself out into system? To answer this one must bear in mind what Fichte intended by designating all philosophy Wissenschaftslehre, or theory of science. Philosophy is to him the rethinking of actual cognition, the *theory* of knowledge, the complete, systematic exposition of the principles which lie at the basis of all reasoned cognition. It traces the necessary acts by which the cognitive consciousness comes to be what it is, both in form and content. Not that it is a natural history, or even a *phenomenology* of consciousness; only in the later writings did Fichte adopt even the genetic method of exposition; it is the complete statement of the pure principles of the understanding in their rational or necessary order. But if complete, this Wissenschaftslehre must be able to deduce the whole organism of cognition from certain fundamental axioms, themselves unproved and incapable of proof; only thus can we have a *system* of reason. From these primary axioms the whole body of necessary thoughts must be developed, and, as Socrates would say, the argument itself will indicate the path of the development.

Of such primitive principles, the absolutely necessary conditions of possible cognition, only three are thinkable,—one perfectly unconditioned both in form and matter; a second, unconditioned in form, but not in matter; a third, unconditioned in matter but not in form. Of these, evidently the first must be the fundamental; to some extent it conditions the other two, though these cannot be deduced from it or proved by it. The statement of these principles forms the introduction to Wissenschaftslehre.

The method which Fichte first adopted for stating these axioms is not calculated to throw full light upon them, and tends to exaggerate the apparent airiness and unsubstantiality of his deduction. They may be explained thus. The primitive condition of all intelligence is that the ego shall posit, affirm, or be aware of itself. The ego is the ego; such is the first pure act of conscious intelligence, that by which alone consciousness can come to be what it is. It is what Fichte called a Deed-act (*Thathandlung*); we cannot be aware of the process,—the ego *is* not until it has affirmed itself,—but we are aware of the result, and can see the necessity of the act by which it is brought about. The ego then posits itself as real. What the ego posits is real. But in consciousness there is equally given a primitive act of op-positing, or contra-positing, formally distinct from the act of position, but materially determined, in so far as what is op-posited must be the negative of that which was posited. The non-ego—not, be it noticed, the world as we know it—is op-posed in consciousness to the ego. The ego is not the non-ego. How this act of op-positing is possible and necessary, only becomes clear in the practical philosophy, and even there the inherent difficulty leads to a higher view. But third, we have now an absolute antithesis to our original thesis. Only the ego is real, but the non-ego is posited in the ego. The contradiction is solved in a higher synthesis, which takes up into itself the two opposites. The ego and non-ego *limit* one another, or determine one another; and, as limitation is negation of part of a divisible quantum, in this third act, the divisible ego is op-posed to a divisible non-ego.

From this point onwards the course proceeds by the method already made clear. We progress by making explicit the oppositions contained in the fundamental synthesis, by uniting these opposites, analyzing the new synthesis, and so on, until we reach an ultimate pair. Now, in the synthesis of the third act two principles may be distinguished:—(1) the non-ego determines the ego; (2) the ego determines the non-ego. As determined the ego is theoretical, as determining it is practical; ultimately the opposed principles must be united by showing how the ego is both determining and determined.

It is impossible to enter here on the steps by which the theoretical ego is shown to develop into the complete system of cognitive categories, or to trace the deduction of the processes (productive imagination, intuition, sensation, understanding, judgment, reason) by which the quite indefinite non-ego comes to assume the appearance of definite objects in the forms of time and space. All this evolution is the necessary consequence of the determination of the ego by the non-ego. But it is clear that the non-ego cannot really determine the ego. There is no reality beyond the ego itself. The contradiction can only be suppressed if the ego itself opposes to itself the non-ego, places it as an *Anstoss* or plane on which its own activity breaks and from which it is reflected. Now, this op-positing of the *Anstoss* is the necessary condition of the practical ego, of the will. If the ego be a striving power, then of necessity a limit must be set by which its striving is manifest. But how can the infinitely active ego posit a limit to its own activity? Here we come to the *crux* of Fichte's system, which is only partly cleared up in the *Rechtslehre* and *Sittenlehre*. If the ego be pure activity, free activity, it can only become aware of itself by positing some limit. We cannot possibly have any cognition of how such an act is possible. But as it is a free act, the ego cannot be determined to it by anything beyond itself; it cannot be aware of its own freedom otherwise than as determined by other free egos. Thus in the *Rechtslehre* and *Sittenlehre*, the multiplicity of egos is deduced, and with this deduction the first form of the *Wissenschaftslehre* appeared to end.

(*c*) But in fact deeper questions remained. We have spoken of the ego as becoming aware of its own freedom, and have shown how the existence of other egos and of a world in which these egos may act are the necessary conditions of consciousness of freedom. But all this is the work of the ego. All that has been expounded follows if the ego comes to consciousness. We have therefore to consider that the absolute ego, from which spring all the individual egos, is not subject to these conditions, but freely determines itself to them. How is this absolute ego to be conceived? As early as 1797 Fichte had begun to see that the ultimate basis of his system was the absolute ego, in which is no difference of subject and object; in 1800 the *Bestimmung des Menschen* defined this absolute ego as the infinite moral will of the universe, God, in whom are all the individual egos, from whom they have sprung. It lay in the nature of the thing that more precise utterances should be given on this subject, and these we find in the *Thatsachen des Bewusstseyns* and in all the later lectures. God in them is the absolute Life, the absolute One, who becomes conscious of himself by self-diremption into the individual egos. The individual ego is only possible as opposed to a non-ego, to a world of the senses; thus God, the infinite will, manifests himself in the individual, and the individual has over against him the non-ego or thing. "The individuals do not make part of the being of the one life, but are a pure form of its absolute freedom." "The individual is not conscious of himself, but the Life is conscious of itself in individual form and as an individual." In order that the Life may act, though it is not necessary that it *should* act, individualization is necessary. "Thus," says Fichte, "we reach a final conclusion. Knowledge is not mere knowledge of itself, but of being, and of the one being that truly is, viz., God. . . . This one possible object of knowledge is never known in its purity, but ever broken into the various forms of knowledge which are and can be shown to be necessary. The demonstration of the necessity of these forms is philosophy or *Wissenschaftslehre*" (*Thats. des. Bewuss.*, *Werke*, ii. 685). This ultimate view is expressed throughout the lectures (in the *Nachgel. Werke*) in uncouth and mystical language.

It will escape no one (1) how the idea and method of the *Wissenschaftslehre* prepare the way for the later Hegelian dialectic, and (2) how completely the whole philosophy of Schopenhauer is contained in the later writings of Fichte. It is not to the credit of historians that Schopenhauer's debt should have been allowed to pass with so little notice.

Fichte's complete works have been published by his son, J. H. Fichte; *Werke*, 11 vols. (vols. i.–viii., 1845–46; ix.–xi. *Nachgelassene Werke*, 1834); also the *Leben und Briefwechsel*, 2 vols., 1830 (2d ed. 1862). The most complete works on his philosophy are—Busse, *Fichte und seine Beziehung zur Gegenwart*, 1848–49; Löwe, *Die Philosophie Fichte's*, 1862; Noack, *Fichte nach seinem Leben, Lehren, und Wirken*, 1862; Fischer, *Geschichte d. neuern Philosophie*, v., 1868–69. See also the histories of post-Kantian philosophy by Erdmann, Fortlage (whose account is remarkably good), Michelet, Biedermann, and others. Dr. William Smith has translated many of the later and more popular writings, and has contributed a very excellent biography of Fichte (*Popular Writings of Fichte, with Memoir*, new edition 1871); Krœger has translated the best portions of the *Wissenschaftslehre* (Science of Knowledge, Philadelphia, 1868) and the *Naturrecht* (Science of Rights, 1870). Several other pieces have been translated in the St. Louis *Journal of Speculative Philosophy*. (R. AD.)

FICHTELGEBIRGE, a mountain group of Bavaria, Germany, forming the centre from which three extensive mountain ranges proceed,—the Erzgebirge in a N.E., the Frankenwalde in a N.W., and the Böhmerwald in a S.E. direction. The streams to which it gives rise flow towards the four cardinal points,—*e. g.*, the Eger eastward and the Saale northward, both to the Elbe; the Main westward to the Rhine, and the Naab southward to the Danube. The chief points of the mass are the Schneeberg and the Ochsenkopf, the former having a height of 3490, and the latter of 3340 feet. The whole district is pretty thickly populated, and there is great abundance of wood, as well as of iron, vitriol, sulphur, copper, lead, and many kinds of marble. In some of the streams mother-of-pearl is found. The inhabitants are employed chiefly in the iron mines, at forges and blast-furnaces, and in charcoal burning and the manufacture of blacking from firewood. The Fichtelgebirge are not much visited by strangers, the only important points of interest being Alexandersbad (a delightfully situated watering-place) and the sandstone labyrinth of Luisenburg.

FICINO, MARSILIO (1433–1499), was born at Figline, in the upper Arno valley, in the year 1433. His father, a physician of some eminence, settled in Florence, and attached himself to the person of Cosimo de' Medici. Here the young Marsilio received his elementary education in grammar and Latin literature at the high school or studio pubblico. While still a boy, he showed promise of rare literary gifts, and distinguished himself by his facility in the acquisition of knowledge. Not only literature, but the physical sciences, as then taught, had a charm for him; and he is said to have made considerable progress in medicine under the tuition of his father. He was of a tranquil temperament, sensitive to music and poetry, and debarred by weak health from joining in the more active pleasures of his fellow-students. When he had attained the age of eighteen or nineteen years, Cosimo received him into his household, and determined to make use of his rare disposition for scholarship in the development of a long-cherished project. During the session of the council for the union of the Greek and Latin churches at Florence in 1439, Cosimo had made acquaintance with Gemistos Plethon, the Neo-Platonic sage of Mistra, whose discourses upon Plato and the Alexandrian mystics so fascinated the learned society of Florence that they named him the second Plato. It had been the dream of this man's whole life to supersede both forms of Christianity by a semi-pagan theosophy deduced from the writings of the later Pythagoreans and Platonists. When, therefore, he perceived the impression he had made upon the first citizen of Florence, Gemistos suggested that the capital of modern culture would be a fit place for the resuscitation of the once so famous Academy of Athens. Cosimo took this hint. The second half of the 15th century was destined to be the age of Academies in Italy, and the regnant passion for antiquity satisfied itself with any imitation, however grotesque, of Greek or Roman institutions. In order to found his new Academy upon a firm basis Cosimo resolved not only to assemble men of letters for the purpose of Platonic disputation at certain regular intervals, but also to appoint a hierophant and official expositor of Platonic doctrine. He hoped by these means to give a certain stability to his projected institution, and to avoid the superficiality of mere enthusiasm. The plan was good; and with the rare instinct for character which distinguished him, he made choice of the right man for his purpose in the young Marsilio.

Before he had begun to learn Greek, Marsilio entered upon the task of studying and elucidating Plato. It is known that at this early period of his life, while he was yet a novice, he wrote voluminous treatises on the great philosopher, which he afterwards, however, gave to the flames. In the year 1459 John Argyropoulos was lecturing on the Greek language and literature at Florence, and Marsilio became his pupil. He was then about twenty-three years of age. Seven years later he felt himself a sufficiently ripe Greek scholar to begin the translation of Plato, by which his name is famous in the history of scholarship, and which is still the best translation of that author Italy can boast. The MSS. on which he worked were supplied by his patron Cosimo de' Medici and by Amerigo Benci. While the translation was still in progress

Ficino from time to time submitted its pages to the scholars, Angelo Poliziano, Cristoforo Landino, Demetrios Chalchondylas, and others; and since these men were all members of the Platonic Academy, there can be no doubt that the discussions raised upon the text and Latin version greatly served to promote the purpose of Cosimo's foundation. At last the book appeared in 1482, the expenses of the press being defrayed by the noble Florentine, Filippo Valori. About the same time Marsilio completed and published his treatise on the Platonic doctrine of immortality (*Theologia Platonica de Immortalitate Animæ*), the work by which his claims to take rank as a philosopher must be estimated. This was shortly followed by the translation of Plotinus into Latin, and by a voluminous commentary, the former finished in 1486, the latter in 1491, and both published at the cost of Lorenzo de' Medici just one month after his death. As a supplement to these labors in the field of Platonic and Alexandrian philosophy, Marsilio next devoted his energies to the translation of Dionysius the Areopagite, whose work on the celestial hierarchy, though recognized as spurious by the Neapolitan humanist, Lorenzo Valla, had supreme attraction for the mystic and uncritical intellect of Ficino.

It is not easy to value the services of Marsilio Ficino at their proper worth. As a philosopher, he can advance no claim to originality, his laborious treatise on Platonic theology being little better than a mass of ill-digested erudition. As a scholar, he failed to recognize the distinctions between different periods of antiquity and various schools of thought. As an exponent of Plato, he suffered from the fatal error of confounding Plato with the later Platonists. It is true that in this respect he did not differ widely from the mass of his contemporaries. Lorenzo Valla and Angelo Poliziano, almost alone among the scholars of that age, showed a true critical perception. For the rest, it was enough that an author should be ancient to secure their admiration. The whole of antiquity seemed precious in the eyes of its discoverers; and even a thinker so acute as Pico di Mirandola, dreamed of the possibility of extracting the essence of philosophical truth by indiscriminate collation of the most divergent doctrines. Ficino was, moreover, a firm believer in planetary influences. He could not separate his philosophical from his astrological studies, and caught eagerly at any fragment of antiquity which seemed to support his cherished delusions. It may here be incidentally mentioned that this superstition brought him into trouble with the Roman church. In 1489 he was accused of magic before Pope Innocent VIII., and had to secure the good offices of Francesco Soderini, Ermolao Barbaro, and the archbishop Rinaldo Orsini, in order to purge himself of a most perilous imputation. What Ficino achieved of really solid, was his translation. The value of that work cannot be denied; the impulse which it gave to Platonic studies in Italy, and through them to the formation of the new philosophy in Europe, is indisputable. Ficino differed from the majority of his contemporaries in this that, while he felt the influence of antiquity no less strongly than they did, he never lost his faith in Christianity, or contaminated his morals by contact with paganism. For him, as for Petrarch, St. Augustin was the model of a Christian student. The cardinal point of his doctrine was the identity of religion and philosophy. He held that philosophy consists in the study of truth and wisdom, and that God alone is truth and wisdom,—so that philosophy is but religion, and true religion is genuine philosophy. Religion, indeed, is common to all men, but its pure form is that revealed through Christ; and the teaching of Christ is sufficient to a man in all circumstances of life. Yet it cannot be expected that every man should accept the faith without reasoning; and here Ficino found a place for Platonism. He maintained that the Platonic doctrine was providentially made to harmonize with Christianity, in order that by its means speculative intellects might be led to Christ. The transition from this point of view to an almost superstitious adoration of Plato was natural; and Ficino, we know, joined in the hymns and celebrations with which the Florentine Academy honored their great master on the day of his birth and death. Those famous festivals in which Lorenzo de' Medici delighted had indeed a pagan tone appropriate to the sentiment of the Renaissance; nor were all the worshippers of the Athenian sage so true to Christianity as his devoted student.

Of Ficino's personal life there is but little to be said. In order that he might have leisure for uninterrupted study, Cosimo de' Medici gave him a house near S. Maria Nuova in Florence, and a little farm at Montevecchio, not far from the villa of Careggi. Ficino, like nearly all the scholars of that age in Italy, delighted in country life. At Montevecchio he lived contentedly among his books, in the neighborhood of his two friends, Pico at Querceto, and Poliziano at Fiesole, cheering his solitude by playing on the lute, and corresponding with the most illustrious men of Italy. His letters, extending over the years 1474–1494, have been published, both separately and in his collected works. From these it may be gathered that nearly every living scholar of note was included in the list of his friends, and that the subjects which interested him were by no means confined to his Platonic studies. As instances of his close intimacy with illustrious Florentine families, it may be mentioned that he held the young Francesco Guicciardini at the font; and that he helped to cast the horoscope of the Casa Strozzi in the Via Tornabuoni.

At the age of forty Ficino took orders, and was honored with a canonry of S. Lorenzo. He was henceforth assiduous in the performance of his duties, preaching in his cure of Novoli, and also in the cathedral and the church of the Angeli at Florence. He used to say that no man was better than a good priest, and none worse than a bad one. His life corresponded in all points to his principles. It was the life of a sincere Christian, and a real sage,—of one who found the best fruits of philosophy in the practice of the Christian virtues. A more amiable and a more harmless man never lived; and this was much in that age of discordant passions and lawless license. In spite of his weak health, he was indefatigably industrious. His tastes were of the simplest; and while scholars like Filelfo were intent on extracting money from their patrons by flattery and threats, he remained so poor that he owed the publication of all his many works to private munificence. For his old patrons of the house of Medici Ficino always cherished sentiments of the liveliest gratitude. Cosimo he called his second father, saying that Ficino had given him life, but Cosimo new birth,—the one had devoted him to Galen, the other to the divine Plato,—the one was physician of the body, the other of the soul. With Lorenzo he lived on terms of familiar, affectionate, almost parental intimacy. He had seen the young prince grow up in the palace of the Via Larga, and had helped in the development of his rare intellect. In later years he did not shrink from uttering a word of warning and advice, when he thought that the master of the Florentine republic was too much inclined to yield to pleasure. A characteristic proof of his attachment to the house of Medici was furnished by a yearly custom which he practised at his farm at Montevecchio. He used to invite the contadini who had served Cosimo to a banquet on the day of Sts. Cosimo and Damiano (the patron saints of the Medici), and entertained them with music and singing. This affection was amply returned. Cosimo employed almost the last hours of his life in listening to Ficino's reading of a treatise on the highest good; while Lorenzo, in a poem on true happiness, described him as the mirror of the world, the nursling of sacred muses, the harmonizer of wisdom and beauty in complete accord. Ficino died at Florence in 1499.

Besides the works already noticed, Ficino composed a treatise on the Christian religion, which was first given to the world in 1476, a translation into Italian of Dante's *De Monarchia*, a life of Plato, and numerous essays on ethical and semi-philosophical subjects. Vigor of reasoning and originality of view were not his characteristics as a writer; nor will the student who has raked these dust heaps of miscellaneous learning and old-fashioned mysticism discover more than a few sentences of genuine enthusiasm and simple-hearted aspiration to repay his trouble and reward his patience. Only in familiar letters, prolegomena, and prefaces do we find the man Ficino, and learn to know his thoughts and sentiments unclouded by a mist of citations; these minor compositions have therefore a certain permanent value, and will continually be studied for the light they throw upon the learned circle gathered round Lorenzo in the golden age of humanism.

The student may be referred for further information to the following works:—*Marsilii Ficini Opera*, Basileæ, 1576; *Marsilii Ficini Vita*, auctore Corsio, ed. Bandini, Pisa, 1771; Roscoe's *Life of Lorenzo de' Medici*; Pasquale Villari, *La Storia di Girolamo Savonarola*, Firenze, Le Monnier, 1859; Von Reumont, *Lorenzo de' Medici*, Leipsic, 1874. (J. A. S.)

FICTIONS, in law, or legal fictions, are false averments, the truth of which is not permitted to be called in question. English law as well as Roman law abounds in fictions. Sometimes they are merely the condensed expression of a rule of law,—*e.g.*, the fiction of English law that husband and wife are one person, and the fiction of Roman law that the wife is the daughter of the husband. Sometimes they must be regarded as reasons invented in order to justify a rule of law according to an implied ethical standard. Of this sort seems to be the fiction or presumption that every one knows the law, which reconciles the rule that ignorance is no excuse for crime with the moral commonplace that it is unfair to punish a man for violating a law of whose existence he was unaware. Again, some fictions are deliberate falsehoods, adopted as true for the purpose of establishing a remedy not otherwise attainable. Of this sort are the numerous fictions of English law by which the different courts obtained jurisdiction in private business, removed inconvenient restrictions in the law relating to land, etc.

What to the scientific jurist is a stumbling-block is to the older writers on English law a beautiful device for reconciling the strict letter of the law with common sense and justice. Blackstone, in noticing the well-known fiction by which the Court of Queen's Bench established its jurisdiction in common pleas (viz., that the defendant was in custody of the marshal of the court), says, "These fictions of law, though at first they may startle the student, he will find upon further consideration to be highly beneficial and useful; especially as this maxim is ever invariably observed, that no fiction shall extend to work an injury; its proper operation being to prevent a mischief or remedy an inconvenience that might result from the general rule of law. So true it is that *in fictione juris semper subsistit æquitas*." Austin, on the other hand, while correctly assigning as the cause of many fictions the desire to combine the necessary reform with some show of respect for the abrogated law, makes the following harsh criticism as to others:—"Why the plain meanings which I have now stated should be obscured by the fictions to which I have just adverted I cannot conjecture. A wish on the part of the authors of the fictions to render the law as *uncognoscible* as may be is probably the cause which Mr. Bentham would assign. I judge not, I confess, so uncharitably; I rather impute such fictions to the sheer imbecility (or, if you will, to the active and sportive fancies) of their grave and venerable authors, than to any deliberate design, good or evil." Bentham, of course, saw in fictions the instrument by which the great object of his abhorrence, *judiciary law*, was produced. It was the means by which judges usurped the functions of legislators. "A fiction of law," he says, "may be defined as a wilful falsehood, having for its object the stealing legislative powers by and for hands which could not or durst not openly claim it, and but for the delusion thus produced could not exercise it." A partnership, he says, was formed between the kings and the judges against the interests of the people. "Monarchs found force; lawyers fraud; thus was the capital found" (*Historical Preface to the second edition of the Fragment on Government*).[1]

Sir H. Maine (*Ancient Law*) supplies the historical element which is always lacking in the explanations of Austin and Bentham. Fictions form one of the agencies by which, in progressive societies, positive law is brought into harmony with public opinion. The others are equity and statutes. Fictions in this sense include, not merely the obvious falsities of the English and Roman systems, but any assumption which conceals a change of law by retaining the old formula after the change has been made. It thus includes both the case law of the English and the *Responsa Prudentum* of the Romans. "At a particular stage of social progress they are invaluable expedients for overcoming the rigidity of law; and, indeed, without one of them, the fiction of adoption, which permits the family tie to be artificially created, it is difficult to understand how society would ever have escaped from its swaddling clothes, and taken its first steps towards civilization."

The bolder remedial fictions of English law have been to a large extent removed by legislation, and one great obstacle to any reconstruction of the legal system has thus been partially removed. Where the real remedy stood in glaring contrast to the nominal rule, it has been openly ratified by statute. In ejectment cases the mysterious sham litigants have disappeared. The bond of entail can be broken without having recourse to the collusive proceedings of fine and recovery. Fictions have been almost entirely banished from the procedure of the courts. The action for damages on account of seduction, which is still nominally an action by the father for loss of his daughter's services, is perhaps the only fictitious action now remaining.

Fictions which appear in the form of principles (like that of the unity of husband and wife) are not so easily dealt with by legislation. To expel them formally from the system would require the re-enactment of vast portions of law. A change in legal modes of speech and thought would be more effective. The legal mind instinctively seizes upon concrete aids to abstract reasoning. Many hard and revolting fictions must have begun their career as metaphors. In some cases the history of the change may still almost be traced. The conception that a man-of-war is a floating island, or that an ambassador's house is beyond the territorial limits of the country in which he resides, was originally a figure of speech designed to set a rule of law in a striking light. It is then gravely accepted as true in fact, and other rules of law are deduced from it. Its beginning is to be compared with such phrases as "an Englishman's house is his castle," which have had no legal offshoots, and still remain mere figures of speech.

Constitutional law is of course honeycombed with fictions. Here there is hardly ever anything like direct legislative change, and yet real change is incessant. The rules defining the sovereign power and fixing the authority of its various members are in most points the same as they were at the last revolution,—in many points they have been the same since the beginning of parliamentary government. But they have long ceased to be true in fact; and it would hardly be too much to say that the entire series of formal propositions called the constitution is merely a series of fictions. The legal attributes of the king, and even of the House of Lords, are fictions. If we could suppose that the effects of the two Reform Acts had been brought about, not by legislation, but by the decisions of law courts and the practice of House of Commons committees—by such assumptions as that freeholder includes lease-holder, and that ten means twenty—we should have in the legal constitution of the House of Commons the same kind of fictions that we find in the legal statement of the attributes of the crown and the House of Lords. Here, too, fictions have been largely resorted to for the purpose of supporting particular theories,—popular or monarchical,—and such have flourished even more vigorously than purely legal fictions. (E. R.)

FIDENÆ, identified with the modern CASTELLO GIUBILEO, an old and important Latin city on the left bank of the Tiber, about five miles above Rome. It is said by Livy to have owed its origin to the Etruscans; but his testimony is not supported by any other historian. There is no Latin city which plays so important a part in the annals of regal Rome. According to the tradition of the Roman historians, hostilities first broke out between the two cities in the time of Romulus, and continued with little intermission and various success till 496 B.C., when, being abandoned by its allies, it was forced to yield to the Roman arms. In 438 B.C. the Fidenates revolted and slew the Roman ambassadors, but after maintaining for twelve years an unequal contest, their city was taken and plundered, and themselves sold into slavery. From this time Fidenæ almost disappears. In the later period of the republic, and under the empire, it was a small country village, and it is mentioned by Horace as almost proverbially desolate. In the reign of Tiberius it acquired a dismal notoriety: an extraordinary gladiatorial show had attracted vast multitudes from Rome and the surrounding country, and the wooden amphitheatre in which they were accommodated fell during the exhibition, and destroyed, it is said, nearly 50,000 persons. No ruins of Fidenæ now exist.

---

[1] In the same essay Bentham notices the comparative rarity of fictions in Scotch law. As to fiction in particular, compared with the work done by it in English law, the use made of it by the Scotch is next to nothing. No need have they had of any such clumsy instrument. They have two others "of their own making, by which things of the same sort have been done with much less trouble. *Nobile officium* gives them the creative power of legislation; this and the word desuetude together the annihilative." And he notices aptly enough that, while the English lawyers declared that James II. had abdicated the throne (which everybody knew to be false), the Scotch lawyers boldly said he had forfeited it.

FIELD, JOHN (1782–1837), one of the most remarkable pianists of his time, and of the few composers of British origin whose works have acquired European reputation, was born at Dublin in 1782. He was descended from a musical family, his father being a violinist, and his grandfather the organist in one of the churches of Dublin. From the latter the boy received his first musical education. When a few years later the family settled in London, Field became the favorite pupil of the celebrated Clementi, whom he accompanied to Paris, and later, in 1802, on his great concert tour through France, Germany, and Russia. Under the auspices of his master Field appeared in public in most of the great European capitals, especially in St. Petersburg, and in that city he remained when Clementi returned to England. During his stay with the great pianist Field had to suffer many privations, owing to Clementi's all but unexampled parsimony; but when the latter left Russia his splendid connection amongst the highest circles of the capital became Field's inheritance. Fame and wealth were now within his grasp, but owing to his extravagant and dissipated way of life the composer was never free from care; and to the same cause his early end must no doubt be attributed. His marriage with a French lady of the name of Charpentier was anything but happy, and had soon to be dissolved. Field made frequent concert tours to the chief cities of Russia, and in 1820 settled permanently in Moscow. In 1831 he came to England for a short time, and for the next four years led a migratory life in France, Germany, and Italy, exciting the admiration of amateurs wherever he appeared in public. In Naples he fell seriously ill, and lay several months in the hospital, till a Russian family discovered him and brought him back to Moscow. There he lingered for several years till his death on January 11, 1837. Field was not a prolific writer, but he has left many works which will not easily be forgotten. His training and the cast of his genius were not of a kind to enable him to excel in the larger forms of instrumental music, and of his seven concerti for the pianoforte few, if any, are heard in concert-rooms now-a-days. Neither do his quartets for strings and pianoforte hold their own by the side of those of the great masters. But in the minor forms of composition he has shown gifts surpassed by few of his contemporaries. Especially his "nocturnes," a form of music highly developed, if not actually created by him, remain all but unrivalled for their tenderness and dreaminess of conception, combined with a continuous flow of beautiful melody. But their best claim to immortality is the fact that they have been the models of Chopin's still higher efforts in the same direction. Field's execution on the pianoforte was nearly allied to the nature of his compositions, beauty and poetical charm of touch being mentioned by contemporaries as one of the chief characteristics of his style. A certain monotony was the almost necessary complement of these qualities. Moscheles, who heard Field in 1831, speaks of his "enchanting legato." "I again," he writes on another occasion, "admired his tenderness and elegance and his beautiful touch; but he wants spirit and accent, light and shade, and intensity of feeling."

FIELD, NATHAN, a dramatist and actor of the time of Elizabeth, was probably born about, but not later than, 1587. He was the son of the rector of Cripplegate, the Rev. John Field, and early became one of the children of Queen Elizabeth's chapel, and in 1600 he played one of the principal parts in Ben Jonson's *Cynthia's Revels*, which was acted by children. Next year he played in the *Poetaster*, in 1607 in *Bussey d'Ambois*, and in 1608 in *Epicene*, on which occasion his is the only name among the "children" of 1600 which still remains. In 1612, when he must have been very young, he brought out his first play, the original comedy of *A Woman is a Weathercock*, in which the inconstancy of woman is made a theme fertile in humor. In 1613 he was engaged with Daborne in writing a play which has not been handed down to us; and soon afterwards we find these two authors, in conjunction with Massinger, praying Henslowe for a small sum of money to free them from imprisonment. In 1618 Field printed *Amends for Ladies*, in which he reversed the judgment of his first comedy, and, in the persons of a virtuous maid, wife, and widow, vindicated womankind against himself. It has been supposed that Field had some hand in editing the first folio Shakespeare in 1623; he certainly assisted Massinger in that year in composing his tragedy of *The Fatal Dowry*, and the play bears evident traces of his co-operation. In 1639 he reprinted the *Amends for Ladies*, and in 1641 he was dead. There exists a portrait of Field in Dulwich College. He was the poetic "son" of George Chapman, and the associate of many dramatic poets of that age. His elder brother Theophilus, also a writer of verse, entered the church, and rose to be bishop of Llandaff and afterwards of Hereford. The two unassisted plays of Nathan Field are comedies of contemporary London life, and are mainly written in very smooth and flowing blank verse. They contain one or two lyrics, which, in conjunction with certain passages in *The Fatal Dowry*, prove Field to have surpassed Massinger in lyrical power. *Amends for Ladies* is greatly superior to its companion play in animation, plausibility, and humor; but the passages between Scudmore and Bellafront in *A Woman is a Weathercock* perhaps display the serious style of Field at its best. His song "Rise, lady mistress, rise," in *Amends for Ladies*, is a charming aubade. It is to be regretted that we possess so little of the work of this bright and sensible writer. His plays have never been collected.

FIELDFARE, Anglo-Saxon *Fealo-for* (=Fallow-farer), a large species of Thrush, the *Turdus pilaris* of Linnæus—well known as a regular and common autumnal visitor throughout the British Islands and a great part of Europe, besides Western Asia, and even reaching Northern Africa. It is the *Veldjakker* and *Veld-lyster* of the Dutch, the *Wachholderdrossel* and *Kramtsvogel* of Germans, the *Litorne* of the French, and the *Cesena* of Italians. This bird is of all Thrushes the most gregarious in habit, not only migrating in large bands and keeping in flocks during the winter, but even commonly breeding in society—200 nests or more having been seen within a very small space. The birch-forests of Norway, Sweden, and Russia are its chief resorts in summer, but it is known also to breed sparingly in some districts of Germany. Though its nest has been many times reported to have been found in Scotland, there is perhaps no record of such an incident that is not open to doubt; and unquestionably the Mistletoe-Thrush (*T. viscivorus*) has been often mistaken for the Fieldfare by indifferent observers. The head, neck, upper part of the back, and the rump are gray; the wings, wing-coverts, and middle of the back are rich hazel-brown; the throat is ochraceous, and the breast reddish-brown—both being streaked or spotted with black, while the belly and lower wing-coverts are white, and the legs and toes very dark brown. The nest and eggs resemble those of the Blackbird (*T. merula*), but the former is usually built high up in a tree. The Fieldfare's call-note is harsh and loud, sounding like *t'chat-t'chat:* its song is low, twittering, and poor. It usually arrives in Britain about the middle or end of October, but sometimes earlier, and often remains till the middle of May before departing for its northern breeding-places. In hard weather it throngs to the berry-bearing bushes which then afford it sustenance, but in open winters the flocks spread over the fields in search of animal food—worms, slugs, and the larvæ of insects. In very severe seasons it will altogether leave the country, and then return for a shorter or longer time as spring approaches. From the author of *William of Palerne* to the writers of our own day the Fieldfare has occasionally been noticed by British poets with varying propriety. Thus Chaucer's association of its name with frost is as happy as true, while Scott was more than unlucky in his well-known reference to its "lowly nest" in the Highlands.

Structurally very like the Fieldfare, but differing greatly in many other respects, is the bird known in North America as the "Robin"—its ruddy breast and familiar habits reminding the early British settlers in the New World of the household favorite of their former homes. This bird, the *Turdus migrotorius* of Linnæus, has a wide geographical range, extending from the Atlantic to the Pacific, and from Greenland to Guatemala, and, except at its extreme limits, is almost everywhere a very abundant species.[1] As its scientific name imports, it is essentially a migrant, and gathers in flocks to pass the winter in the south, though a few remain in New England throughout the year. Yet its social instincts point rather in the direction of man than of its own kind, and it is not known to breed in companies, while it affects the homesteads, villages, and even the parks and gardens of the large cities, where its fine song, its attractive plumage, and its great services as a destroyer of noxious insects, combine to make it justly popular. (A. N.)

---

[1] It is recorded as having occurred a few times in Europe and once even in England (*Zool.*, 1877, p. 14); but whether in any case it has been a voluntary visitor may be regarded as doubtful.

FIELDING, ANTHONY VANDYKE COPLEY (1787–1855), commonly called Copley Fielding, an English landscape-painter, became at an early age a pupil of John Varley. He took to the water-color method of art, and to this he confined himself almost exclusively. In 1810 he became an associate exhibitor in the Water-color Society, in 1813 a full member, and in 1831 president of that body. He also engaged largely in teaching the art. His death took place at Worthing in March, 1855. Fielding was a painter of much elegance, taste, and accomplishment, without reaching very high in originality of purpose or of style: he painted all sorts of views, including marine subjects in large proportion. Five specimens of his work are to be seen in the water-color gallery of the South Kensington Museum, of dates ranging from 1829 to 1850. Among the engraved specimens of his art is the *Annual of British Landscape Scenery*, published in 1839.

FIELDING HENRY (1707–1754). The pedigree of Fielding the novelist will always be remembered by an eloquent passage in one of Gibbon's essays. "Our immortal Fielding was of the younger branch of the earls of Denbigh, who drew their origin from the counts of Hapsburg, the lineal descendants of Eltrico, in the 7th century duke of Alsace. Far different have been the fortunes of the English and German divisions of the family of Hapsburg: the former, the knights and sheriffs of Leicestershire, have slowly risen to the dignity of a peerage; the latter, the emperors of Germany and kings of Spain, have threatened the liberties of the Old, and invaded the treasures of the New World. The successors of Charles V. may disdain their brethren in England; but the romance of *Tom Jones*—that exquisite picture of humor and manners—will outlive the palace of the Escurial and the imperial eagle of Austria."

Henry Fielding was born at Sharpham Park, near Glastonbury, Somersetshire, on the 22d of April, 1707. There was nothing in the circumstances of his birth to foreshow that the descendant of such illustrious ancestors would drift as rapidly as he did into Bohemia. His father, the youngest son of the earl of Desmond, and grandson of the first earl of Denbigh, is said to have distinguished himself as an officer under Marlborough, though the details of his career are not known. Shortly after the battle of Ramillies, he appears settled in England as a country squire, having married the daughter of Sir Henry Gould, a judge of the King's Bench. As Captain Fielding's family grew, and his love of profuse hospitality manifested itself, and when, on the death of his first wife, he married a second time, and this marriage also proved fertile, it became apparent that his eldest son, the future novelist, would have little patrimony but his wits. His book education had been conducted so far in the ordinary way; he had been taught at home by the family chaplain (said to be the original of Parson Trulliber), and in due course was sent to Eton. But he did not proceed to Oxford with his schoolfellows Lyttelton and Pitt, but, probably from the growing needs for economy at home, was despatched to the university of Leyden.

As we know only the barest leading facts about that interesting seminal period, the first twenty years, of Fielding's life, we can hardly venture even a guess at the circumstances which had given such early encouragement to the bent of his genius that he returned from Leyden after two years' residence there, bringing with him as the chief fruit of his studies a first sketch of a comedy called *Don Quixote in England*. The most significant incident in the records of his early life is his friendship with the studious, ambitious, precocious Lyttelton, a friendship which cannot have been without a powerful influence on an impressionable boy, whose high animal spirits and keen relish for existence did not predispose him to study. In after years the novelist made a point of displaying, with a certain degree of ostentation, the solid learning which he then acquired, and with all his rollicking dash and recklessness devoted himself to severe intellectual labor with a zeal which we never find in those who have spent an idle youth. There is no genius so easily dissipated and diverted from the creation of imperishable works as that of humor; and it is a fair conjecture that the abundant gifts of the "prose Homer" received direction and stimulus from his friend's example as well as his father's impecuniosity. He had no talent for the versification in which Lyttelton delighted and attained such success as to find a place among Johnson's Poets; the only distinction he achieved in that line was the mention of his name by Swift as an unapproachable master of the art of sinking. We can conceive that Fielding's sympathy with his friend's pretty pastoral fancies and glowing heroics was not invariably earnest; still his thoughts had been turned towards literature and learning, while his genius was left free to discover its own natural path.

If his father had been able to pay him his nominal allowance of £200 a year when he returned from Leyden, in all likelihood Fielding would have qualified himself for admission to the bar, and the wit which has become a possession for all time would have spent itself for the entertainment of the law-courts. But, as he says himself of his allowance, "anybody might pay it who would;" and meantime he resolved to put money in his purse by writing for the stage. He submitted his sketch of *Don Quixote in England* to Booth and Cibber, but both, he tells us, "dissuaded him from suffering it to be represented." He rewrote it afterwards when his services were in request, and, conceiving the idea of making the Knight stand for a borough, added some election scenes which greatly increased its value as an acting play. Meantime, he set himself with ready versatility to provide a comedy in the manner of Congreve. His first effort, entitled *Love in Several Masques*, was produced at Drury Lane in February, 1728, and when the author printed it with a dedication to his kinswoman Lady Mary Wortley Montague, he was able to boast that though it succeeded one of the most successful comedies of the time, the *Provoked Husband*, and was "contemporary with an entertainment which engrossed the whole talk and admiration of the town," it had no small measure of success. For ten years from this date Fielding was an established and prolific play-writer, as will be seen from the following catalogue:—*The Temple Beau*, a comedy, 1730; *The Author's Farce*, 1730; *The Coffee-House Politician*, a comedy, 1730; *Tom Thumb the Great*, a burlesque, 1730; *The Letter Writers*, a farce, 1731; *The Grub Street Opera*, a burlesque, 1731; *The Lottery*, a farce, 1731; *The Modern Husband*, a comedy, 1732; *The Covent Garden Tragedy*, a burlesque, 1732; *The Debauchee*, a comedy, 1732; *The Mock Doctor* (adaptation of Molière's *Le Médecin malgre lui*), 1732; *The Miser* (adaptation of *L'Avare*), 1733; *Deborah, or a Wife for you all*, an afterpiece, 1733; *The Intriguing Chambermaid*, a two-act comedy, 1733; *Don Quixote in England*, a comedy, 1734; *An Old Man taught Wisdom*, a farce, 1735; *The Universal Gallant*, a comedy, 1735; *Pasquin*, a dramatic satire, 1736; *The Historical Register*, 1737; *Eurydice*, a farce, 1737; *Eurydice Hissed*, 1737; *Tumble-down Dick*, an extravaganza, 1737; *Miss Lucy in Town*, a farce, 1742; *The Wedding-Day*, a comedy, 1743. And not only did Fielding write plays; he identified himself so closely with the stage as to become a manager. He had a booth at Bartholomew Fair in 1733, in conjunction with Hyppesley the comedian; and in 1736, he took the Haymarket Theatre, and organized a company called "The Great Mogul's Company," a notable incident in the history of the stage, inasmuch as it led to the institution of the dramatic censorship.

None of Fielding's plays, with the exception, perhaps, of his adaptation of the *Miser*, can be said to have "kept the stage;" few even of the students of literature have read them, and those who have read them have dismissed them too hastily. The closest students these plays have ever had were the dramatists of the following generation, whose works, notably those of Sheridan, contain many traces of their assiduity. The tradition about his writing scenes after his return from tavern carousals on the papers in which his tobacco had been wrapt, and his cool reception of Garrick's desire that he should alter some passsage in the *Wedding-Day*, have helped the impression that they were loose, ill-considered, ill-constructed productions, scribbled off hastily to meet passing demands. There is only a fraction of the truth in this notion. That the plays are not the work of a dull plodder or a mechanician of elaborate ingenuity goes without saying; but, though perhaps rapidly considered and rapidly constructed, they are neither ill-considered nor ill-constructed, and bear testimony to the large and keen intelligence, as well as the overflowing humor and fertile wit, of their author. With all Fielding's high spirits, joyous self-confidence, and disdain of criticism, he was no idler over his work; whatever his hand found to do, writing plays, or newspaper articles, or novels, reading law, or administering justice, he did with all his might. He found in play-writing abundant scope for the exercise of that far-sighted and fertile constructive faculty which gave the world afterwards in *Tom Jones* one of the most perfect plots in literature. His plays abound in artfully prepared surprises, and the conclusions are never huddled, confused, and unsatisfactory; he never lacked the skill to unloose the knots which he had had the ingenuity to tie. It may be taken as a national characteristic, whether in the way of merit or defect must be for others to say, that he wrote for the stage as he found it, and practised its methods as he found them, troubling himself little with theories of what it and they ought to be. If we know anything of the actors and actresses who took part in his plays, it is amusing to trace the skill with which he adapted himself to their peculiarities. With regard to his moral tone, it is substantially the same as that which pervades *Tom Jones*. He had no sympathy whatever with the goodness or goodiness of Addison and Steele. His creed is stated in the prologue to the second of his plays, "written by a friend," perhaps the same friend to whom he says he owed the first suggestion of *Tom Jones*, the friend of his school-days, Lord Lyttelton. Some persons, this prologue runs,

"Will argue that the stage
Was meant to improve and not debauch the age.
Pshaw! to improve! the stage was first designed
Such as they are to represent mankind."

If we desire to draw a distinction between Fielding's morality and that of the Restoration dramatists, we should say that he takes more care that the rakes shall not have the best of it.

Very early in his dramatic career Fielding discovered how much of his strength lay in burlesque. The obligations which he professed to owe to Cibber in the preface to his first comedy did not prevent him from turning that versatile writer and his son Theophilus to ridicule very soon afterwards. That Cibber, in the mean time, had offended him by refusing the *Temple Beau*, which was not acted at Drury Lane, or the *Wedding-Day*, which was originally intended for Mrs. Oldfield and Wilkes, is likely enough; if so, the *Author's Farce*, in which a poor play-writer reads a play to the manager and receives his comments upon it, listening all the while to his self-glorification, was an ample revenge. In *Tom Thumb*, a burlesque on inflated tragedy, in which the taste introduced by Dryden and other tragic dramatists of the Restoration period is parodied with irresistible humor, the satire is of a less personal kind, and can be read now with more enjoyment. Fielding, with the consciousness of his aristocratic descent as well as his superior powers, had a large share of Pope's contempt for Grub Street, and was a sort of Ishmael among his play-writing brethren, losing no opportunity of girding at them, and complaining to the public more than once that they had conspired to "damn" his plays. He found, too, another field for his satire in the political corruption of the time. When he returned from Leyden to London, he had solicited the patronage of Sir Robert Walpole, as was the custom of the time, in a copy of verses, but the great minister had paid no heed to them. He was thus left free to indulge his humor. The election scenes in *Don Quixote*, in which he gave a ludicrous representation of the corrupt arts of politicians and the venality of corporations, had made a hit: and when Fielding took the Haymarket Theatre, and assembled a company of unemployed actors, he endeavored to crown this success by a still bolder lampoon on the times. The mock-comedy in *Pasquin* is an election scene, in which he gratifies at the same time his contempt for the performances of rival playwrights and his hatred of political dishonesty. When *Pasquin* was followed up by the *Historical Register*, in which the political transactions for the previous year were freely travestied, the legislature deemed it time to interfere; and after a witty and eloquent protest from the earl of Chesterfield, in which he argued against the measure as an attack upon the property of authors, wit, "too often the only property they have to depend on," a bill was passed to amend the Acts relating to rogues, vagabonds, sturdy beggars, and vagrants, by a provision that every dramatic piece, previous to its representation, should receive the license of the lord chamberlain. Fielding was thus responsible for the institution of the lord chamberlain's censorship of the stage.

It is generally an irksome task to read plays which were written to be acted, and intended to owe no small part of their point to the art of the actors, but the task is considerably lightened in the case of Fielding's plays by the light which they throw on his private history. When he began life in London as a youth of twenty, he had access through his friends and relations to the most brilliant society. Whether he took much advantage of this, in spite of his dislike to "that swarm of impertinences which compose the common-place chat of the world," or whether he succumbed at once to the charms of "low life," with its frank oddities and eccentricities, which his fashionable friends said acquired complete ascendency over him in his later years, we have no means of knowing; but, according to all traditions, he drew from his own case in the character of Luckless in the *Author's Farce*. Luckless is represented as being in a condition which would be pitiable but for the imperturbable cheerfulness and gayety with which he bears it,—attired as a man of fashion but very much in debt, his door almost battered in by duns, winning the heart of his lodging-house-keeper and staying her just claims by his good-humor and wit, seldom dining more than once at the same ordinary, and helped occasionally out of desperate pinches by the generosity of his friends. The colors of the picture are probably somewhat overcharged, but all are agreed as to its substantial truthfulness. We have the authority of his friend Murphy for saying that to the end of his days Fielding was always hard pressed for money; neither his impecuniosity nor his cheerfulness ever deserted him. He had a brief interval of abundance and reckless profusion for two or three years after his marriage with Miss Craddock, a Salisbury "belle," and heiress of £1500. The exact date of his marriage with this lady, who is said to be the original of Amelia, as a former sweetheart and cousin of his, Miss Sarah Andrews, was of Sophia Western, is not known; it took place some time during his play-writing career, probably in 1737, when he was twenty-nine years of age; but whatever may have been the date of the marriage, the youthful husband very soon spent his wife's money. He went, his biographer Murphy tells us, to live in the country, on a small estate which he had inherited from his mother, and at once set about dazzling and outbraving the squires of the neighborhood by setting up a magnificent equipage, dressing a numerous retinue of servants in yellow plush, and dispensing an open-handed hospitality. From this congenial "fling" he was soon compelled to return to his literary drudgery in London, and, it is conjectured, to domestic troubles such as he has depicted in the household of Captain and Mrs. Booth, filled with no high opinion of the intellects and manners of the rural squirearchy, but still unsoured at heart, ready as before to meet all embarrassments with a cheerful face, and to profess himself a disciple of Democritus rather than Heraclitus.

The institution of the lord chamberlain's censorship, and the consequent dispersion of the Great Mogul's company, was a great discouragement to Fielding's play-writing, just as he had hit upon a new and profitable vein. In 1737 he entered as a student of the Middle Temple, and devoted himself with great energy to the study of the law. As a gap of two years occurs at this period in the series of his literary publications, we may probably set this down as the date of his marriage and his experiment at living in the country. Before he had completed his terms, he again had recourse to literary employment, projecting, in conjunction with a journalist of the name of Ralph, a thrice-a-week journal called the *Champion*. It is based on the model of the *Spectator* and the *Tatler*, but in the first number, in which Fielding gives an account of his contributors—different members of the great family of Vinegar—and his purposes, he announces his intention of discussing politics freely as well as literary and social subjects, laying down as his "platform" the reduction of the army, the abolition of useless offices, the restoration of triennial parliaments, and the removal of "that grand anti-constitutional first mover, a prime minister." As the journal went on, these objects did not assume a prominent place; still, the *Champion* is broader in its scope and more rollicking in its tone than the *Spectator*, as might have been expected from the less decorous character of its principal writers. In two volumes of it which were republished in 1741, the work of the different contributors is indicated, and we find among Fielding's essays the germs of many of the disquisitions with which he afterwards adorned his novels. In the *Champion* also he renewed his warfare with Cibber, who had turned upon his witty persecutor and assailed him angrily in his *Apology* as "a broken wit," who, in his "haste to get money," did not scruple to "draw the mob after him," by "raking the channel and pelting their superiors." Fielding's temper was disturbed but not overthrown by this furious onslaught; he retorted merrily by drawing up an account of a trial of the laureate for murder, the murder of his native tongue. At the same time the bitter taunts rankled, and prompted Fielding to many further reprisals. It was significant of Cibber's power of stinging that his enemies could never let him alone.

The next episode in Fielding's life was a serious attempt to get practice at the bar. He was called to the bar in June, 1740, and we are assured by Murphy that he threw himself earnestly into the work, forswore literature, attended Westminster Hall diligently, went circuit; but briefs did not come in, he could not afford to wait, and was compelled, however reluctantly, to return to his old trade.

Fielding returned to literature, but in a new character. A few months after he was called to the bar Richardson's novel *Pamela* was published, and was received with the favor always accorded to whatever is fresh and out of the beaten track. Richardson's novels are somewhat tedious reading now, but their simplicity and close adherence to nature were a new revelation to a public surfeited with the extravagant improbabilities and fictitious heroic manners of the school of romance of which *Parthenissa* was the most illustrious example in English. *Pamela* at once became a book that everybody had to read. Fielding read it, but with less reverence and admiration than the ladies of the time. A man cannot escape from the prevalent moral teaching of his generation; his attitude towards it must be either sympathetic or militant. The prosperous evenly conducted printer had complete sympathy with the worldly ethics of the 18th century; the idea of writing *Pamela* had been put into his head by the suggestion that he should write "a little book of familiar letters on the useful concerns of common life;" and in his earnestness to promote the cause of religion and virtue he saw nothing absurd in making a young maid-servant resist the improper advances of her master and be sustained in her resistance by a secret hope that he might be driven by his passion into offering her lawful marriage. To Fielding, on the other hand, there was something ludicrous in good conduct which was so closely allied to artfulness, and he was moved to write a parody of Mrs. Andrews's virtue and distressing humility in the adventures of Joseph Andrews, who, "by keeping the excellent pattern of his sister's virtues before his eyes," was enabled to preserve his purity in the midst of great temptations. *Joseph Andrews*, published in 1742, was thus in its original conception a parody of *Pamela*, but the author, though he began it with this intention, and executed his intention with inimitable wit, became aware as he went on that he was introducing a kind of writing as new in its way to English readers as *Pamela* itself, and when he issued the work he endeavored in his preface to place it on a higher ground than mere burlesque. There was a wide difference, he said, between the comic and the burlesque,—the burlesque writer striving to exhibit what is monstrous, unnatural, delightfully and surprisingly absurd, while the comic writer confined himself strictly to nature, and was of all writers the last to be excused for deviating from it, because "life everywhere furnishes an accurate observer with the ridiculous." Distinguishing epic writing into the tragic and the comic, and "not scrupling to say" that it might be in prose as well as in verse, Fielding claimed for *Joseph Andrews* the title of a comic prose epic. The author's criticism on his own work has never been surpassed for justness; it is a striking testimony that genius is not always unconscious of its own excellence. He was equally correct in describing the novel as being "written in the manner of Cervantes," for in *Joseph Andrews* there is the same blending of the ludicrous, the admirable, and the pathetic as in the character of the knight of La Mancha. The humble squire, not the knight, was his hero, but he had at last succeeded in the dream of his youth, introducing Don Quixote into England.

It may be assumed that the most irritating thing to Richardson in Fielding's parody was the humorous malice of making Pamela endeavor to dissuade her brother from lowering their family by marrying poor Fanny. This wise advice was too nearly in keeping with the prudent character of Mrs. B. (or, as Fielding filled out the initial, Mrs. Booby); and that a person of low habits should preach a higher, or at least a more spiritual morality than himself, must have been gall and wormwood to the moralist.

Joseph Andrews was almost as great a success as *Pamela*. Fielding had received £200 for it from Andrew Millar, after vainly negotiating with another publisher for £25. The sum was not sufficient to allow him to rest on his oars. His next work, published two months after *Joseph Andrews*, was a pamphlet in defence of "Old Sarah," the duchess of Marlborough. Considering that his father had been a favorite with the duke, and that one of his sisters was named after the duchess, there is no reason to suppose that Fielding's eulogy was venal, whatever consideration he may have received for the service. In May of the same year (1742) his last composition for the stage, *Miss Lucy in Town*, a sequel to an *An Old Man Taught Wisdom*, was produced at Drury Lane; but the enemy whom he had raised up, the lord chamberlain, prohibited the piece, when it had run successfully for several nights, because one of the characters was supposed to be a satire on a person of quality. Early in the following year he was induced to undertake to recast for Garrick his comedy of *The Wedding-Day*, the third comedy he ever wrote, which had been rejected years before by a manager, possibly Cibber. The serious illness of his wife prevented him from recasting the play; produced as it stood, it was a failure. This was the end of Fielding's connection with the stage. In 1743 he published three volumes of Miscellanies, the first volume containing poems, essays, and imaginary dialogues, the second being *A Journey from this World to the Next*, the third *The History of Jonathan Wild the Great*. The conversations between eminent men of the past, which the imaginary traveller overheard in his journey to the shades, are full of the most delicate satiric humor, and bear testimony also to the vividness of Fielding's scholarship. *Jonathan Wild*, in some respects the most powerful of Fielding's works, is the only one in which the satire is dashed with bitterness. The bitterness is not predominant: his irrepressible humor has everywhere got the mastery, and risen to the surface; but the blows aimed at the arts by which men attain fame and fortune are so fierce as to suggest that at no other period in his career had Fielding's troubles so deep a hold of him. At no other time was he so nearly overmastered by the savage feelings of the disappointed man, who sees his inferiors in ability outstripping him in the race by arts which he will not practise. At no other time, indeed, had Fielding such cause for bitterness in the accumulation of every kind of worry and vexation as in the year 1743. The evils of poverty, which were always present with him, were aggravated by the dangerous illness of his wife, to whom he was passionately attached. He was so distracted by anxiety for her safety, and remorse at the thought of being to blame for her discomfort, that he could not proceed with the work on which he depended for the support of his family. His own health was far from being good; he suffered from attacks of gout, brought on by his sedentary habits and his excesses. Meantime the enemies whom he had enraged by his satires were swarming round him with endless devices for his annoyance. No man ever wrote in more desperate and pitiable circumstances. Yet there is no perceptible diminution in the splendid force of his humor. He shook off his troubles like a giant, and gave no sign of the pain at his heart, save in the fiercer energy of his blows. It may well increase our admiration for the genius shown in *Jonathan Wild* to know that the author labored in the face of so deadly a conspiracy to rob his hand of its strength.

In 1743 Mrs. Fielding caught a fever, and died, Lady Mary W. Montague says, in her husband's arms. For two years afterwards he published nothing but a preface to his sister's novel, *David Simple*. Although Sarah Fielding was one of Richardson's favorites, and heard laments from him about her brother's "continued lowness," she seems to have comforted that low brother in his sorrow, and even lived in the same house with him. It was probably at this time that Fielding received from Lord Lyttelton the assistance which he gratefully acknowledges in the dedication of *Tom Jones*. As that masterpiece is said to have been "the labor of some years of his life," we may conjecture that it was begun some time during these otherwise barren years, and that, as *Don Quixote* was written in a prison, *Tom*

Jones was written when its author was only saved from despair and destitution by the tender kindness of two lifelong friends.

In 1745 Fielding made a second successful venture in periodical literature. In November of that year, when London was agitated by the news of the preparations of the Jacobites for marching across the border, he issued the first number of the *True Patriot*, in which he brought all his powers of ridicule and his robust sense to the service of the established Government. He continued the publication of the *True Patriot* till the rebellion was suppressed. More than a year afterwards, in December, 1747, he began another periodical, called *The Jacobite Journal*, the object of which he stated to be "to eradicate those feelings and sentiments which had been already so effectually crushed on the field of Culloden." In both these ventures he was probably assisted by his staunch friend Lyttelton. One of the reasons he gave for starting them was the lamentable ignorance of the common run of journalists, and the greater accuracy of the information at his command, a taunt and boast for which his rivals retaliated by copious personal abuse, and the accusation that he was in the pay of the Government. If Fielding was in the pay of the Government, they made but a poor return for his support when it was no longer required. Soon after the discontinuance of the *Jacobite Journal*, towards the close of 1748, he obtained, again, it is said, through Lyttelton's assistance, the post of a paid Middlesex magistrate. In one of his earliest comedies Fielding had thrown hearty ridicule on these functionaries, who had brought their office into disrepute by their scandalous venality. It was notorious that they eked out their small fees by selling justice to the highest bidder. When Fielding himself accepted such an office his enemies exulted loudly over the step as a degradation. About the same time he gave them another handle for scurrility by marrying his deceased wife's maid. This last act, as Lady Mary Montague said, "was not so discreditable to his character as it may sound." "The maid had few personal charms, but was an excellent creature, devotedly attached to her mistress, and almost broken-hearted for her loss. In the first agonies of his own grief, which approached to frenzy, he found no relief but from weeping along with her, no solace, when a degree calmer, but in talking to her of the angel they mutually regretted. This made her his habitual confidential associate; and in process of time he began to think he could not give his children a tenderer mother, or secure for himself a more faithful housekeeper and nurse. At least this was what he told his friends, and it is certain that her conduct as his wife confirmed it, and fully justified his good opinion."

Fielding's enemies did not scruple to say that in his discharge of his duties as a justice he was no better than his own Justice Thrasher; but there was no foundation for the charge,—it was only a personal retort in the coarse manner of the time. We have, on the contrary, in the zeal with which Fielding applied himself to his work, an instance of that earnest side of his character which is perhaps kept too much in the background in Thackeray's charming lecture on him as a humorist. One of his favorite themes was the preposterousness of undertaking any work without the requisite knowledge, and he showed by his published charge to a grand jury, by pamphlets on various notorious cases, and by an elaborate inquiry into the causes of crime and the most advisable remedies, that he was himself a diligent student of the numerous volumes of the law which he ridiculed Justice Thrasher for neglecting. He was sufficiently sensitive to the spiteful calumnies of his literary antagonists to formally deny, in his *Journal of a Voyage to Lisbon*, that he had been guilty of the corruption with which they charged him, declaring that, "on the contrary, by composing instead of inflaming the quarrels of porters and beggars, and by refusing to take a shilling from a man who most undoubtedly would not have had another left, he had reduced an income of about £500 a year, of the dirtiest money upon earth"—the income of the justice came from fees—"to little more than £300, a considerable portion of which remained with his clerk."

A few months after his appointment to the justiceship, in February, 1749, Fielding published his masterpiece *The History of Tom Jones, a Foundling.* Here we have the ripe fruits of his life. His varied experience supplied his imagination with abundant suggestions of incident. His long struggle with his pen for a livelihood had given elasticity to his style. His mind was full; the hackwork, which would have exhausted poorer energies had mobilized his, and made him perfect master of his resources. Hard minds, like stones, are not enriched by rolling; but Fielding's mind was of the plastic sort, and went on gaining by its incessant movement. His heart, too, had remained as fresh as his brain. His own life had been far from scrupulously pure, but he could still give the world "a miracle of loveliest womanhood" in Sophia Western. His name had been a byword and reproach in respectable circles from his early manhood upwards, but he could still write in deprecation of the cynical philosophy of Mandeville, and create a pattern English gentleman in Squire Allworthy. One would never imagine from reading *Tom Jones* that its author was a man of illustrious family who had treated his titled relations with airy independence, and been left by them to win a livelihood by the exercise of his own wits, unsupported by any of the sinecures which their influence might have placed at his disposal. There was no moralist of the time whose scorn was so heartily and steadily directed against vice, against profligacy, avarice, hypocrisy, meanness in every shape and size; he made war without ceasing on all ungenerous emotions. In breaking with convention, he remained faithful to society. It is a curious circumstance that this true soldier in the war of humanity, like his great exemplar Cervantes, should be more often read for the sake of indelicate passages which he wrote in pursuance of fidelity to nature, than for the generous sentiment and wise philosophy with which his work as a whole is penetrated. But even this posthumous injustice he could have foreseen without ill-nature.

Judging from Richardson's lament over his rival's continued lowness, and the anecdote told by Horace Walpole of his being found "banqueting with a blind man and three Irishmen" when some persons of quality wanted his services as a police magistrate, one might imagine that Fielding spent his leisure off the bench in gratifying his preference for low company. That he enjoyed the frankness and originality of unconventional associates is likely enough; but he has shown that he had more profitable employment for his leisure. In the first two years after he took office, he completed his last novel, *Amelia*. It has always been supposed that, in the relations between the somewhat frail but good-natured Captain Booth and his perfect wife Amelia, Fielding drew in some particulars at least from his own domestic life. Dr. Johnson, who refused to read *Joseph Andrews*, and inferred from *Tom Jones* that Fielding was "a blockhead" and "a barren rascal," owned that he was so taken by *Amelia* as to read it through at a sitting, and mentions as an evidence of its popularity that it was the only instance he knew of the whole of a first edition being sold in one day. Mr. Lawrence has pointed out that this last circumstance was due to the ingenuity of the publisher; still the sale was sufficiently rapid to be a tribute to the popularity of its predecessors from the same pen. A more substantial tribute to the author was the increasing price paid for his labors; he received £600 for *Tom Jones*, and £1000 for *Amelia*. Fielding's editor and biographer, Arthur Murphy, professed to see in *Amelia* signs of a genius falling into decay; but, as in the case of Dickens, the decay does not lie in matters that affect the intellect. *Amelia* is inferior to *Tom Jones* only in so far as its humor is less exuberant; it is even richer in happily turned humorous sayings. But the color of the incidents is more predominantly serious; the laughing philosopher has not changed his mood, but he takes less strong delight in creating materials for laughter.

As soon as *Amelia* was off his hands, Fielding bent himself with unflagging energy to a new enterprise. In January, 1752, he issued the first number of a new periodical, the *Covent Garden Journal*, "by Sir Alexander Drawcansir, Knight, *censor* of Great Britain." In the first number he proved that his appetite for literary warfare was undiminished, giving fair warning to "scribblers" in general that they must expect no mercy; and soon after, he began an exchange of personalities with Dr. John Hill which Disraeli has thought worthy of a place among his quarrels of authors. Among other writers who accepted Fielding's challenge was Smollett, whose ground of quarrel was probably political, but to him Fielding made no reply. He was never an indiscriminate satirist, either in words or in literature; he reserved his lash for what he believed to be bad, and not even provocation could make him attack a man whose writings he respected.

The *Covent Garden Journal* was discontinued towards the end of 1752, partly, it may be supposed, in consequence of Fielding's health making him unable to bear the strain. He had long been a sufferer from gout; he had undermined his naturally robust constitution by hard work and reckless living; and in 1753 his frame began to exhibit symptoms of dropsy. The narrative of the last painful year of his life is given in his *Journal of a Voyage to Lisbon.* At a moment when the disease might have been curable, or at least might have been delayed in its ravages, he was kept in town to carry out a scheme for putting down organized gangs of robbers who were setting the law at defiance. He tried the effect of the waters at Bath; he experimented on himself with Bishop Berkeley's specific of tar-water; he submitted frequently to the operation of tapping; but the summer of 1754 found him with "the dropsy gaining rather than losing ground, the distance growing still shorter between the tappings." In June he set sail for Lisbon to give himself the chance of a milder winter; but the precaution was unavailing. He died at Lisbon on the 8th of October, 1754. To the last, as his *Journal* shows, he preserved his cheerfulness and his mental activity. Besides his *Journal*, he left behind him a fragment of an answer to Lord Bolingbroke's religious and philosophical essays, for which, according to Murphy, he had prepared himself by collecting "long extracts and arguments from the fathers, and the most eminent writers of controversy." "It is a pity," Lady Mary Montague wrote when she heard of his death, "he was not immortal;" he was "so formed for happiness."

An essay on Fielding's life and writings is prefixed to Arthur Murphy's collected edition of his works; and short biographies have been written by Sir Walter Scott and William Roscoe. The most complete biography is Mr. F. Lawrence's, a conscientious and thorough piece of work. (W. M.)

FIERI FACIAS, in English law, is a writ of execution after judgment obtained in action of debt or damages. It is addressed to the sheriff, and commands him to make good the amount out of the goods of the person against whom judgment has been obtained.

FIESCHI, Joseph Marie (1790–1836), assassin, the chief conspirator in the attempt on the life of Louis Philippe in July, 1835, was a native of Murato in Corsica, and was baptized there, December 3, 1790. After following his father's occupation, that of a shepherd, he enlisted at the age of eighteen in the Corsican Legion, at Naples, and passed with it into the service of Murat, king of Naples. In 1814 he returned to Corsica, and in the following year took part in the fatal expedition of Murat for the recovery of his crown. Sentence of death was passed on him and his companions, but it was not executed; and Fieschi once more returned to his native land. In 1816 he was convicted of theft and forgery, and was condemned to imprisonment for ten years. After his release he led for several years a restless miserable life, working only by fits, and eking out his resources by fraud and swindling. He went to Paris after the Revolution of July (1830), and by means of forged papers passed himself off as a victim of the Restoration, and obtained a pension and official employment. He affected a zealous devotion to the Government, entered the police, and displayed much energy in the suppression of disturbances. But meanwhile his house was the scene of violent proceedings, and the neighborhood was kept in alarm by frequent noises, cries, and pistol-shots in and around it. Facts where brought to light which cost him his friends and his employments. Exasperated by dismissal and the "ingratitude of the Government," he vowed a terrible vengeance. He took lodgings on the Boulevard du Temple, and there, with several infamous confederates, contrived his "infernal machine," constructed with twenty gun barrels, to be fired simultaneously. In July, 1835, the fifth anniversary of the Revolution was to be celebrated. Vague rumors getting afloat of some impending catastrophe, of some horrible attempt on the life of the king, prudential measures were taken. On the 28th, as Louis Philippe was holding a grand review, and was passing along the boulevard accompanied by his three sons and a numerous staff, a sudden explosion was heard, followed by others, and the pavement was strewed with dead and wounded men. A ball grazed the king's forehead, and his horse, with those of the duke of Nemours and the prince de Joinville, was shot; but the king and the princes escaped as if by miracle. Fieschi himself was severely wounded by the discharge of his machine, and vainly attempted to escape. The attentions of the most skilful physicians were lavished upon him, and his life was saved for the stroke of justice. On his trial he named his accomplices, displayed much bravado, and expected or pretended to expect ultimate pardon. He was condemned to death, and was guillotined, February 19, 1836, making on the scaffold a premeditated theatrical display at the feet of his confessor. Of his accomplices two were executed, one was sentened to twenty years' imprisonment, and one was acquitted. A full account of the trial, *Procès de Fieschi*, appeared at Paris the same year.

FIESCO [de' Fieschi], Giovanni Luigi (about 1523–1547), count of Lavagna, Genoese conspirator, was descended from a great historical family which counted among its members Popes Innocent IV. and Adrian V. He was born about 1523, and by the death of his father he became at the age of twenty-three the head of his race and the possessor of considerable estates. He had allied himself by marriage with the ancient family of Cibo,—his wife Eleanora, then about twenty years of age, being a woman of high spirit, great beauty, and remarkable attainments. To the advantages of youth and wealth Fiesco added those of a fine figure, a handsome countenance, and fascinating manners. He was ambitious of power and high place, and inherited from his ancestors a strong passion of jealousy and hatred against the Doria family, the head of which, Andrea Doria, was then doge of the republic, while his nephew, the young Gianettino Doria, was commander of the galleys. With personal and family hostility was combined the political enmity between the imperial and French (aristocratic and popular) parties,—the Dorias belonging to the former and being warmly supported by the nobles, while the Fieschi were of the latter and leaned upon the popular class. Bent on the overthrow of the doge and his family, Giovanni Luigi made an attempt to secure the support of Francis I. in his enterprise, but in this he did not at first succeed. The negotiations were afterwards renewed through William du Bellay, then French ambassador in Italy, and an understanding was come to that the object of the proposed revolution should be to subject the republic to the king of France. The sanction of the pope, Paul III., was obtained, and the alliance of the duke of Parma and Placentia secured. Associated with Giovanni Luigi in the conspiracy were his brothers Geronimo and Ottobuoni, and his trusted friends Vincenzo Calcagno, De Varese, and Raffaello Sacco. Troops were levied in the duchy of Parma, and report of these suspicious preparations was sent to Andrea Doria to put him on his guard. But his regard for the young count forbade him to entertain suspicion, and no precautions were taken. When all was ready, Fiesco invited the Dorias to a banquet at his palace on the first day of January, 1547, purposing to assassinate them on their arrival. But the doge declined the invitation, his nephew Gianettino had to leave Genoa for some weeks, and the scheme thus foundered. The next night, however, taking advantage of the unsettled state of the city at the period of re-election of the doge, Fiesco led out his band (having first by display of affectionate attention to Doria thrown him off his guard), seized the arsenal, and attacked the galleys. While passing along a plank from the quay to one of the galleys the leader fell into the sea and was drowned, the darkness and the confusion preventing his cries for help being heard. The other conspirators proceeded with their task, and Gianettino was slain. The doge succeeded in making his escape, and after the dispersion of the troops and the flight of the leaders, he returned to Genoa, and was welcomed with extraordinary honors. Eleanora, wife of Fiesco, escaped to Massa, married again, survived her second husband many years, and died at Florence in 1594. The story of this conspiracy has frequently been told both by historians and by poets. Amongst the prose narratives that of Mascardi (Antwerp, 1629) is commended for accuracy of detail, but is wanting in impartiality. Amongst the poems the most noteworthy is the tragedy of Schiller

FIESOLE, a small episcopal city of Italy, occupying the site of the ancient Fæsulæ, on the crown of a hill that rises above the Arno, about three miles to the west of Florence. In size it is little more than a village, but its historical interest is of considerable scope. The principal building is the cathedral, which was commenced by Bishop Giacomo

Bavaro in 1028, and dedicated to San Pietro Romolo, a martyr under Nero. It is a small basilica, consisting of a nave with narrow aisles, a transept, a raised choir, and a crypt noticeable for the uncommon character of its capitals. Among its adornments are an altarpiece and a bust of Bishop Salutati by Mino di Fiesole. The church of St. Maria Primerana, with a terra-cotta tabernacle by L. della Robbia, San Allesandro, with its twelve cipollino columns, the Franciscan convent, the episcopal palace, and the town-hall or palazzo del pretorio, dating from the 13th century, are all worthy of notice. The convent probably occupies the site of the old *arx* or citadel; behind the cathedral there are extensive remains of a large Roman theatre discovered in 1809 and laid bare in 1872–3; and a few dilapidated portions of the ancient Etruscan fortification still stand on the northern brow of the hill. Between the little city and Florence the church of San Domenico di Fiesole marks the site of the monastery famous as the residence of Fra Angelico (see next article); not far from the church is the villa where Walter Savage Landor dwelt many years amid the scenes of Boccaccio's *Decameron;* and further up the hill is the yet more celebrated Villa Mozzi, the favorite haunt of Lorenzo the Magnificent. The present inhabitants of Fiesole are largely employed in straw plaiting. They number, according to the census of 1871, 3467 in the city, and 13,180 in the commune.

Fæsulæ has a great mythical history, according to which it is the oldest city in the world. Its real origin is unknown, but it was evidently an Etruscan site long before the Roman conquest. It became of some note in the Gallic and Punic wars, and was afterwards selected by Sulla for the settlement of a body of his veterans. Twenty years later these colonists rendered themselves formidable by the support which they gave to Catiline, and the town was chosen as his head-quarters in the struggle against Metellus and Antony. The story of Catiline and his exploits has been developed into an elaborate legend by Malespini and other Fiesolan historians. Catellino, as he is called, wages war against Fiorino, king of Rome; the king is slain, but the Fæsulan party is ultimately defeated by Julius Cæsar, and a new city, Fiorenza Magna (Florence), is founded by the conqueror, and named in honor of Fiorino. At a later date Fæsulæ, continues the story, was rebuilt by Attila, and Florence destroyed. From Procopius we know that the little city, while occupied by Witiges and his Goths, did stand a long siege by the forces of Belisarius. According to the common account it was "destroyed" by the Florentines in the 11th or 12th century; but the statement is open to question, and the destruction at any rate cannot have been very complete. Among the more eminent natives of Fiesole are Francesco Ferrucci, the great captain, and Francesco Ferrucci, the first sculptor in porphyry.

FIESOLE (1387–1455). Il Beato Fra Giovanni Angelico da Fiesole is the name given to a far-famed painter-friar of the Florentine state in the 15th century, the protagonist, beyond all other men, of pietistic painting. He is often but not accurately, termed simply "Fiesole," which is merely the name of the town, noticed above, where he first took the vows; more often, Fra Angelico. If we turn his compound designation into English, it runs thus—"the Beatified Friar John the Angelic of Fiesole." In his lifetime he was known no doubt simply as Fra Giovanni, or Friar John; "the Angelic" is a laudatory term which got assigned to him at an early date,—we find it in use within thirty years after his death; and, at some period which is not defined in our authorities, he was beatified by due ecclesiastical process. His surname was Guido: his original Christian name—Giovanni being only his name in religion—is not known. He was born at Vicchio, in the Tuscan province of Mugello, of unknown but seemingly well-to-do parentage, in 1387 (not 1390, as sometimes stated); in 1407 he became a novice in the convent of S. Domenico at Fiesole, and in 1408 he took the vows and entered the Dominican order. Whether he had previously been a painter by profession is not certain, but may be pronounced probable. The painter named Lorenzo Monaco may have contributed to his art-training, and the influence of the Sienese school is discernible in his work. According to Vasari, the first paintings of this artist were in the Certosa of Florence; none such exist there now. His earliest extant performances, in considerable number marked to some extent by the influence of Masolino, are at Cortona, whither he was sent during his noviciate, and here apparently he spent all the opening years of his monastic life. His first works executed in fresco were probably those, now destroyed, which he painted in the convent of S. Domenico in this city; as a fresco-painter, he may have worked under, or as a follower of, Gherardo Starnina. From 1418 to 1436 he was back at Fiesole; in 1436 he was transferred to the Dominican convent of S. Marco in Florence, and in 1438 undertook to paint the altarpiece for the choir, followed by many other works; he may have studied about this time the renowned frescoes in the Brancacci chapel in the Florentine church of the Carmine, and also the paintings of Orcagna. In or about 1445 he was invited by the pope to Rome. The pope who reigned from 1431 to 1447 was Eugenius IV., and he it was who in 1445 appointed another Dominican friar, a colleague of Angelico, to be archbishop of Florence. If the story (first told by Vasari) is true—that this appointment was made at the suggestion of Angelico only after the archbishopric had been offered to himself, and by him declined on the ground of his inaptitude for so elevated and responsible a station—Eugenius, and not (as stated by Vasari) his successor Nicholas V., must have been the pope who sent the invitation and made the offer to Fra Giovanni, for Nicholas only succeeded in 1447. The whole statement lacks authentication, though in itself credible enough. Certain it is that Angelico was staying in Rome in the first half of 1447; and he painted in the Vatican the Capella del Sacramento, which was afterwards demolished by Paul III. In June, 1447, he proceeded to Orvieto, to paint in the Capella Nuova of the cathedral, with the co-operation of his pupil Benozzo Gozzoli. He afterwards returned to Rome to paint the chapel of Nicholas V. In this capital he died in 1455, and he lies buried in the church of the Minerva.

According to all the accounts which have reached us, few men to whom the distinction of beatification has been conferred could have deserved it more nobly than Fra Giovanni. He led a holy and self-denying life, shunning all advancement, and was a brother to the poor; no man ever saw him angered. He painted with unceasing diligence, treating none but sacred subjects: he never retouched or altered his work, probably with a religious feeling that, such as divine providence allowed the thing to come, such it should remain. He was wont to say that he who illustrates the acts of Christ should be with Christ. It is averred that he never handled a brush without fervent prayer, and he wept when he painted a Crucifixion. The Last Judgment and the Annunciation were two of the subjects he most frequently treated.

Bearing in mind the details already given as to the dates of Fra Giovanni's sojournings in various localities, the reader will be able to trace approximately the sequence of the works which we now proceed to name as among his most important productions. In Florence, in the convent of S. Marco (now converted into a national museum), a series of frescoes, beginning towards 1443. In the first cloister is the Crucifixion, with St. Dominick kneeling; and the same treatment recurs on a wall near the dormitory; in the chapterhouse is a third Crucifixion, with the Virgin swooning, a composition of twenty life-sized figures—the red background, which has a strange and harsh effect, is the misdoing of some restorer; an Annunciation, the figures of about three-fourths of life-size, in a dormitory; in the adjoining passage, the Virgin Enthroned, with four saints; on the wall of a cell, the Coronation of the Virgin, with Saints Paul, Thomas Aquinas, Benedict, Dominick, Francis, and Peter Martyr; two Dominicans welcoming Jesus, habited as a pilgrim; an Adoration of the Magi; the Marys at the Sepulchre. All these works are later than the altarpiece which Angelico painted (as before mentioned) for the choir connected with this convent, and which is now in the academy of Florence; it represents the Virgin with Saints Cosmas and Damian (the patrons of the Medici family), Dominick, Peter, Francis, Mark, John Evangelist, and Stephen: the pediment illustrated the lives of Cosmas and Damian, but it has long been severed from the main subject. In the Uffizi gallery, an altarpiece, the Virgin (life-sized) enthroned, with the Infant and twelve angels. In S. Domenico, Fiesole, a few frescoes, less fine than those in St. Marco; also an altarpiece in tempera of the Virgin and Child between Saints Peter, Thomas Aquinas, Dominick, and Peter Martyr, now much destroyed. The subject which originally formed the predella of this picture has, since 1860, been in the London National Gallery, and worthily represents there the hand of the saintly painter. The subject is a Glory, Christ with the banner of the Resurrection, and a multitude of saints, including, at the extremities, the saints or beati of the Dominican order; here are no fewer than 266 figures, or portions of figures, many of them having names inscribed. This predella was highly lauded by Vasari; still more highly another picture which used to form an altar-piece in Fiesole, and which now obtains world-wide celebrity in the Louvre—the Coronation of the Virgin, with eight predella subjects of the miracles of St. Dominick. For the church of S. Trinita, Florence, Angelico executed a Deposition from the Cross, and for the church of the Angeli a Last Judgment, both now in the Florentine academy; for S. Maria Novella, a Coronation of the Virgin, with a predella in three sections, now in the Uffizi,—this again is one of his masterpieces. In Orvieto cathedral he painted three triangular divisions of the ceiling, portraying respectively Christ in a glory of angels, sixteen saints and prophets, and the virgin and apostles: all these are now much repainted and damaged. In Rome, in the chapel of Nicholas V., the acts of Saints Stephen and Lawrence; also various figures of saints, and on the ceiling the four evangelists. These works of the painter's advanced age, which have suffered somewhat from restorations, show vigor superior to that of his youth, along with a more adequate treatment of the architectural perspectives. Naturally, there are a number of works currently attributed to Angelico, but not really his; for instance, a St. Thomas with the Madonna's girdle, in the Lateran museum, and a Virgin enthroned in the church of S. Girolamo, Fiesole. It has often been said that he commenced and frequently practised as an illuminator; this is dubious, and a presumption arises that illuminations executed by Giovanni's brother Benedetto, also a Dominican, who died in 1448, have been ascribed to the more famous artist. Benedetto may perhaps have assisted Giovanni in the frescoes at S. Marco, but nothing of the kind is distinctly traceable. A folio series of engravings from these paintings was published in Florence in 1852. Along with Gozzoli, already mentioned, Zanobi Strozzi and Gentile da Fabriano are named as pupils of the Beato.

We have spoken of Angelico's art as "pietistic;" this is in fact its predominant character. His visages have an air of rapt suavity, devotional fervency, and beaming esoteric consciousness, which is intensely attractive to some minds, and realizes beyond rivalry a particular ideal —that of ecclesiastical saintliness, and detachment from secular fret and turmoil. It should not be denied that he did not always escape the pitfalls of such a method of treatment, the faces becoming sleek and prim, with a smirk of sexless religiosity which hardly eludes the artificial or even the hypocritical; on other minds, therefore, and these some of the most masculine and resolute, he produces little genuine impression. After allowing for this, Angelico should nevertheless be accepted beyond cavil as an exalted typical painter according to his own range of conceptions, consonant with his monastic calling, unsullied purity of life, and exceeding devoutness. Exquisite as he is in his special mode of execution, he undoubtedly falls far short, not only of his great naturalist contemporaries such as Masaccio and Lippo Lippi, but even of so distant a precursor as Giotto, in all that pertains to bold or life-like invention of a subject, or the realization of ordinary appearances, expressions, and actions—the facts of nature, as distinguished from the aspirations or contemplations of the spirit. Technically speaking, he had much finish and harmony of composition and color, without corresponding mastery of light and shade, and his knowledge of the human frame was restricted. The brilliancy and fair light scale of his tints is constantly remarkable, combined with a free use of gilding; this conduces materially to that celestial character which so pre-eminently distinguishes his pictured visions of the divine persons, the hierarchy of heaven, and the glory of the redeemed. (W. M. R.)

FIFE. See FLUTE.

FIFE, a maritime county of Scotland, is situated between 56° 1′ and 56° 27′ N. lat., and 2° 35′ and 3° 40′ W. long., and is bounded on the N. by the Firth of Tay, on the E. by the German Ocean, on the S. by the Firth of Forth, and on the W. by parts of Kinross, Perth, and Clackmannan. Its greatest length from east to west is about 42 miles, and its greatest breadth from north to south about 18 miles; its average length is about 36 miles, and its average breadth 14 miles. The area comprises 513 square miles, or 328,427 imperial acres.

The physical aspect of Fife is redeemed from tameness by the picturesqueness and variety of its maritime scenery. With the exception of the "Howe of Fife," and a portion bordering on the east coast line, its surface is pleasantly undulating. A ridge of high ground, commencing with the Lomond Hills, runs in the middle of the county from west to east, advancing to near St. Andrews in its northern part, and terminating with Kellie Law in the south. Between the Lomonds and a spur of the Ochils lies the somewhat extensive plain called the "Howe of Fife;" and to the south of the Lomonds there is another stretch of low ground running westwards to the south of Kinross, presenting, however, greater variety of surface than the plain on the north side of the Lomonds, and interrupted by Saline Hill, Knock Hill, the Hill of Beath, the Cullalo Hills, and other smaller eminences. Further east the land slopes on all sides from the central range towards the sea, but generally with considerable alternations of hill and dale, the large number of wooded knolls presenting in many places a rather picturesque appearance. The most western part of the northern shore is level and marshy, but as the Firth of Tay widens the coast becomes bold and rocky until the village of Tayport is reached. Between Tayport and St. Andrews there is an almost unbroken and pretty wide expanse of downs, after which the coast line is abruptly elevated, presenting a jagged and precipitous wall of rocks whose ridges here and there run out into the sea. Between Fifeness and Burntisland low and sandy stretches, bending often so as to form small bays, are separated from each other by a shore more or less rocky, and occasionally rising into steep and lofty cliffs. The southern coast to the west of Burntisland is wooded in many cases to the water's edge, and gradually the characteristics of river scenery become more marked. The highest summits in the county are West Lomond Hill (1713 feet), East Lomond Hill (1471), Knock Hill (1189), Saline Hill (1178), and Largo Law (965).

The only streams that aspire to the name of rivers are the Eden, which, formed of affluents rising in the Lomonds and in the country to the north and west of that range, flows north-east by Strathmiglo, Kingskettle, and Cupar, and after a course of about 20 miles falls into St. Andrews Bay; and the Leven, which, issuing from Loch Leven in Kinross-shire, flows eastward through a pleasant strath by Leslie, Balgonie, Balfour, and Cameron Bridge, and about 14 miles from its source empties itself into the Firth of Forth at the town of Leven. The presence of mill-dams and manufactories has rendered both the Eden and Leven almost worthless for salmon fishing, but in these rivers, as well as in the other larger streams not polluted by the water of coal-pits, the trout-fishing is excellent. The largest lochs are Lindores Loch (about 70 acres), Loch Fitty (about 50), Lochgelly (about 50), and Kilconquhar Loch (about 40). Several, such as those of Rossie and Lochore, have been drained, and valuable crops are now raised on their beds.

Geology and Minerals.—The rocks of the southern half of Fife—with the exception of a small portion lying to the east of a line drawn between St. Andrews on the north and Anstruther on the south, and another narrow portion lying between Limekilns and Kinghorn—belong chiefly to the coal formation of geologists. This formation is, however, interrupted by the trap rocks which extend through the central part of the county from Saline to near St. Andrews, and by other masses of trap of igneous origin which penetrate especially into the eastern portion of the coal-field, causing innumerable faults and dykes, and elevating the strata by a succession of steps towards the north. The valley of the Eden and a part of the county between St. Andrews and Anstruther is occupied chiefly by the upper strata of the Old Red Sandstone; and in the north-eastern part of the county there is a continuation of the porphyry formation of the Ochils. The Lomonds and the other larger hills are composed of trap, and are capped with greenstone and amygdaloid.

Fife is the third largest coal-producing county in Scotland, being excelled in this respect by Lanark and Ayr. The earliest record regarding the working of coal in Scotland is a charter granted at the end of the 12th century by the proprietor of Carriden to the monks of Holyrood of one-tenth of his coal-works at Carriden. The coal basin is connected under the Forth with that of Mid-Lothian. It may be roughly divided into the coal-fields of Dunfermline and Wemyss or Dysart. In the Dunfermline district, which includes Halbeath, Lochgelly, and Kelty, the principal house-coals are obtained. At Wemyss and Methil gas-coal of the best quality is largely produced; and out of some seams ink-stands, picture-frames, and various other articles of ornament are manufactured. Coal is also wrought at various places in the north-eastern district of the basin, as at Ceres, Radernie, Falfield, and Largoward.[1] Beds of ironstone, limestone, sandstone, and shale lie in many places contiguous to the coal-beds. Blackband ironstone is worked at Lochgelly and at Oakley, and has also been worked at Denhead near St. Andrews. At the two former places there are large smelting furnaces, and vessels are built at Inverkeithing and Kinghorn of home-made iron. Oil shale from the same measure as at Broxburn and West Calder is worked near Burntisland, and at Airdrie near Crail. Limestone is found in nearly all directions in the coal basin; and in the north-eastern part, instead of lying around the outcrop of the coal strata, it occurs at intervals in the midst of the coal measures. The maritime limestone reaches considerable thickness at Kirkcaldy, and resumes the character of mountain limestone at Charleston. The principal limestone quarries are those at Charleston, those near Burntisland, and others in the parish of Cults near Cupar. Freestone of a superior quality is quarried at Strathmiglo, Burntisland, and Dunfermline. Whinstone of great hardness and durability is obtained in nearly every district, and is much used for building purposes. Lead has been worked in the Lomond Hills, and copper and zinc are also said to have been met with in various places. Marl is found, but is not much used for agricultural purposes. The number of persons employed in connection with the various minerals is upwards of 6000. Fossiliferous fish have been found in great abundance and variety at Dura Den near Cupar, and *Brachiopoda* and minute *Entomostraca* are met with throughout the maritime limestone.[2] The most common vegetable impressions met with in the coal strata are *Lepidodendron* and *Stigmaria*. A complete list of the crystals and other precious stones will be found in a paper by Professor Heddle in Ballingall's *Shores of Fife*, but mention may be here made of the pyropes found in the trap tufa at Elie, which are sold to jewellers under the name of Elie rubies, and are regarded as the most valuable Scottish gem. In the *Shores of Fife* will also be found a paper on the flora of the county.

Climate.—On account of the hills diminishing gradually in height towards the east, the greater part of the county is fully exposed to the blasts of east wind from the German Ocean, which in spring often check considerably the progress of vegetation, although their damaging effect is somewhat lessened by numerous belts of wood. The rainfall is below the average, and the climate is on the whole mild, the heat in summer and the cold in winter being modified by proximity to the sea. On the higher ridges, however, the air is often sharp and rigorous; and at an elevation of from 500 to 600 feet the harvests are on an average from three to four weeks later than in the valleys and on the low ground near the coast. Snow seldom lies long near the sea, but the hills and higher grounds are sometimes coated for a considerable period. Notwithstanding the extensive drainage of the lakes and marshes, the valleys are occasionally visited by floating mists and hoar-frosts even in summer, and grain and potatoes often suffer considerable damage in July from this cause.

Agriculture.—According to the agricultural statistics for 1877 the total area of arable land was 244,865 imperial acres, of which 88,012 were under corn crops, 47,742 under green crops, 58,075 under rotation grasses, 49,599 permanent pasture, and 1437 fallow. The acreage under woods was 22,003. Fife is especially a grain-producing county, and the system of cultivation is chiefly directed to that end. The acreage under wheat—which was 12,384 in 1877—has, as in other districts of Scotland, decreased considerably within the last twenty years, the difference being, in Fife, added principally to the acreage under barley. Along the coast the yield of wheat ranges from 32 to 50 bushels per imperial acre, and inland it ranges from 28 to 40. The red variety is now less grown than formerly. Barley, being a less expensive crop than wheat, as well as less trying to the soil, and finding a ready sale, is increasingly cultivated. The acreage under it was 32,265. The variety most largely grown is chevalier. The return on the richer soils is from 40 to 64 bushels per acre, and inland from 32 to 42. Oats—the acreage of which was 39,818—are a good crop all over the county, and yield on the richer soils from 48 to 72 bushels per acre, and inland from 36 to 54. Beans grow exceedingly well on the heavy land, but are not extensively cultivated, the total acreage being only 2147. The acreage under turnips was 29,093. About one half of the turnip break is sown with swedes, and a considerable quantity of turnip seed is also grown in the county. The yield in yellows is often as high as 35 tons per acre, and of swedes 30 tons, but the average yield is about 25 tons for yellows and 18 for swedes. The acreage under potatoes was 17,488. The average yield is from 5 to 8 tons, and on the finer soils the quality cannot be surpassed. No other green crops are cultivated to any extent. As a six-crop rotation—of oats, potatoes or beans, wheat, turnips, barley, and hay or pasture—is the most common one, the acreage under rotation grasses is more than usually small, but within late years a seven-shift has been obtaining favor, and since 1870 the acreage under grasses has consequently been increasing. In some districts, 8, 5, and 4 shifts are severally in use. The acreage in permanent pasture is considerably below the average. It is chiefly confined to the higher grounds, especially those in the eastern district, and is let by annual roup. As a large number of cattle are fed on most farms there is generally a plentiful supply of farm manure; the extensive coast line also affords a large quantity of seaware; and limestone quarries are within easy reach in most districts.

The number of cattle in 1877 was 37,305, or an average of about 15·2 to every 100 acres under cultivation as compared with 23·6 for Scotland. The number of cows and heifers in milk or in calf was only 8553; and it will therefore be apparent both that a comparatively small number of stock is reared, and that dairy produce forms a very unimportant item in the farmer's returns. On most farms, indeed, with the exception of those adjacent to the larger towns, only a sufficient number of cows are kept to supply the wants of the household and farm servants. As the Board of Trade returns are made up in spring they give considerably less than the full number of cattle wintered annually. These are mostly imported from Ireland, and the county on that account is scarcely ever free from foot-and-mouth disease and pleuro-pneumonia. Except a few shorthorns and a yet smaller number of polled Angus, the cows are mostly crosses of a somewhat obscure origin; but a cross between Galloway cows and short-horned bulls has lately been largely introduced. The number of horses was 10,155, or an average of more than 4·1 to every 100 acres, as compared with 4·0 for Scotland. Of these 7821 were used solely for agricultural purposes. They are a strong, active, and hardy breed. The majority have a large admixture of Clydesdale blood, and the number of pure Clydesdales is gradually increasing. There is a large number of excellent ponies and of carriage and hunting horses. The number of sheep was 73,665, or an average of about 30·0 to every 100 acres, as compared with 149·3 for Scotland. Of these 26,375 were under one year old. As, however, the Board of Trade returns are made up at the end of June they give only the minimum number of sheep in the county, the majority being bought in at the end of autumn for winter feeding. More attention is now paid to the breeding of pigs than formerly, and the old breed has been gradually improved by the introduction of Berkshire boars. The number of pigs was 6593, or an average of about 2·7 to every 100 acres as compared with 3·3 for Scotland. The breeding and rearing of poultry do not generally receive much attention, but the number of fowls kept on a farm is sometimes considerable.

According to the returns, out of a total of 2244 holdings 565 did not exceed 5 acres, 647 lay between 5 and 50, 224 lay between 50 and 100, and 808 were above 100, the great majority of which were between 250 and 350, and only 39 above 500. Leases of 19 years are almost universal except in the case of the smallest holdings. A good many farmers hold more than one farm, but the lease of each farm is usually kept separate. The character of the soil is very various, sometimes even on a single farm, and the differences of rental are consequently very great. In the section north of the Eden, the soil, though generally thin, is sharp and fertile, and the rental varies from £1, 10s. to £3. North-east of Leuchars it is very sandy, and a large tract is on that account incapable of cultivation. From St. Andrews all along the coast it is very productive, but the most valuable part is that adjacent to the East Neuk, which consists chiefly of clay and rich loam, and yields an average rental of from £4 to £5 an acre, and in some cases as much as £8. In the district of Elie the soil is generally light and sandy, but remarkably fertile, and in that of Largo it is mostly a rich clayey loam. The average rental of these districts is from £3 to £4 an acre. From Leven to Inverkeithing the land varies from a light and sandy to a rich and clayey loam, and the average rental is about £3. With the exception of the strath of the

[1] Further particulars regarding the Fife coal-field will be found in the article COAL.

[2] A "Catalogue of the Brachiopoda of Fife and the Lothians" is contained in the *Transactions of the Edinburgh Geological Society* for 1877.

Leven, and part of the valley of the Eden, which consist chiefly of a rich and fertile loam, with a rental averaging from £1, 10s. to £2, 10s., the inland part of Fife is mostly cold and stiff clay or a thin loam with a strong clayey subsoil. It has, however, been greatly improved by cultivation, and the rental, which varies from 15s. to £2, is on an average about £1, 10s. Part of the Howe of Fife is light and shingly, and is covered principally with heather. There are a number of small peat mosses in the county, and near Lochgelly there is yet a pretty extensive tract of waste land, partly moss and partly heath. As nearly all the land suitable for cultivation has been reclaimed for about 40 years, the increase in the rental within that period is not so striking as in some other counties,—the difference since 1850 being only £93,833. Farm management is everywhere conducted on the best modern methods, and within the last twenty-five years the land has been nearly all redrained. A great many of the farmers' houses and of the farm-steadings have been rebuilt within the same period; and on most of the farms the servants' cottages are commodious and comfortable. About three-fourths of the ploughmen are married, and although the majority are only engaged for a year, not more than one-third change their quarters annually. An addition of milk and meal is made to the money wages, and in the case of the unmarried men this forms almost the sole article of diet. The married servants are generally allowed, besides a cottage garden, a portion of land for potatoes sufficient to enable them to rear a pig. All the most improved agricultural implements are in use. Steam cultivation, for which most of the land on account of its freedom from stones and its depth and stiffness of soil is specially well adapted, is being rapidly introduced. Reaping machines are almost universally employed, and most of the grain is thrashed by portable steam-mills. Full particulars regarding the whole subject of Fife agriculture will be found in a paper by James Macdonald, published in the *Transactions of the Highland and Agricultural Society of Scotland*, 1876.

According to the owners and heritages return, 1872–73, the land was divided between 10,410 proprietors, holding land the gross annual value of which was £905,577. Of the owners 82·9 per cent. possessed less than one acre, and the average value all over was £2, 19s. 6d. There were 11 proprietors holding upwards of 4000 acres, viz., John Balfour (Balbirnie) 10,590; George Johnston (Lathrisk) 10,005; Earl of Moray (Donibristle) 7463; Colonel Ferguson (Raith) 7135; Lieutenant-Colonel Tyndall Bruce (Falkland House) 7058; Randolph G. E. Wemyss and trustees of J. H. E. Wemyss (Wemyss Castle) 6925; Earl of Glasgow (Crawford Priory) 5625; Earl of Zetland 5566; Sir Coutts Lindsay (Balcarres) 4672; George Clark Cheape (Wellfield) 4230; and John Anstruther Thomson (Charleton) 4034.

Fife is perhaps below the average as a game-preserving county. Rabbits, hares, pheasants, and partridges are pretty numerous in some districts; roe deer are occasionally seen; wild geese, ducks, and teal frequent the lochs; and grouse and black-cock are somewhat plentiful on the Lomond moors. The pigeon houses have been estimated at 300. The county is particularly well adapted for fox-hunting, and the Fife fox-hounds are now divided into an eastern and a western pack.

Manufactures and Trade.—The staple manufacture is linen. The chief seats of the linen cloth manufacture—which ranges from the coarsest ducks and sackings to the finest damask—are Kirkcaldy and Dunfermline. The largest flax spinning mill is that at Prinlaws near Leslie. The other seats of the linen trade are Auchtermuchty, Cameron Bridge, Cupar, Dura Den, Dysart, Falkland, Freuchie, Guardbridge, Kinghorn, Kingskettle, Ladybank, Leven, Markinch, Newburgh, Springfield, Strathmiglo, Tayport, and East and West Wemyss. There are bleaching greens on the banks of the Eden and Leven, and also at Kirkcaldy, Ceres, and Dunfermline. According to the census of 1871 the number of persons engaged in the linen manufacture was 17,055, of whom 5742 were males and 11,313 females. In the jute manufacture 29 males and 23 females were employed. Kirkcaldy possesses 6 large floor-cloth manufactories, besides others for the manufacture of linoleum. In various towns woollen cloth is manufactured, but only to a small extent. There are fishing-net manufactories at West Wemyss, Kirkcaldy, and Largo. There are breweries and tanneries in the principal towns. The largest distilleries are at Cameron Bridge and Burntisland. Paper is manufactured at Guardbridge, Markinch, and Leslie; earthenware at Kirkcaldy; tobacco at Kirkcaldy and Dunfermline; and oilcake in a few places. Kirkcaldy and Dunfermline possess iron-foundries; and shipbuilding is carried on at Kinghorn, Dysart, Burntisland, Inverkeithing, and Tayport. The principal port is Kirkcaldy; the chief imports are flax and timber, and the chief exports coals and potatoes. The largest salmon fisheries are at Newburgh, but there are others at various parts on the east and south coast. The chief seat of the herring fishing is Anstruther; and the number of boats in the Anstruther district, which includes all the fishing stations in the county, is nearly 800, with a total value of nearly £100,000. For some years the take of herrings on the Fife coast has been very small, and the majority of the Fife fishermen now prosecute the herring fishing at the northern stations.

Towns and Villages.—The number of towns and villages in Fife is exceptionally great. The south coast especially is very thickly populated, and along its whole extent there is almost a continuous line of houses. The large extent of downs on the sea-coast affords great facilities for the Scottish national game of golf. Besides the famous golfing green at St. Andrews, there are others at Cupar, Crail, Elie, Lundinmill, Leven, Innerleven, Wemyss, and Burntisland. The number of boroughs is 16, of which three, Auchtermuchty (1082), Falkland (1144), and Newburgh (2182), are royal; and 13 royal and parliamentary, viz., Anstruther Easter (1289), Anstruther Wester (484), Burntisland (3265), Crail (1112), Cupar (5105), Dunfermline (14,963), Dysart (8919), Inverkeithing (1755), Kilrenny (2539), Kinghorn (1739), Kirkcaldy (12,422), Pittenweem (1760), and St. Andrews (6316). Among the other towns and villages the principal along the coast are Limekilns (735), with a small harbor; Charleston (749), the shipping port of Dunfermline, with an iron-foundry, limeworks, and manufactures of salt; Aberdour (622), a favorite watering place; the manufacturing village of East Wemyss (777); West Wemyss (1231), partly mining but chiefly fishing; the mining village of Methil (648); the fishing villages of Buckhaven (2187), Innerleven (358), and St. Monance (1648); the watering places of Leven (2501), Largo (521), and Earlsferry and Elie (1032); and on the northern coast the towns of Tayport (2498) and Newport (1507). Inland there are Freuchie (1195), Kingskettle (643), Ladybank (772), Leslie (3768) Milton of Balgonie (396), Pitlessie (401), Springfield (608), and Strathmiglo (1509), all chiefly manufacturing; Cairneyhill (435), Cardenden (355), Charleston (749), Coalton (442), Coaltown (343), Cowdenbeath (1457), Crossgates (1181), Donibristle (412), Dunshalt (481), Halbeath (800), Largoward (325), Lochgelly (2369), Methilhill (480), Thornton (526), Townhill (855), Wellwood (678), Windygates (420), all principally mining; and Ceres (1111), Colingsburgh (351), Fordel (641), Kennoway (835), Kilconquhar (381), Kingsbarns (411), Kirkton of Largo (353), Leuchars (523), Lundinmill (539), and Strathkinness (619), with a mixed population—mining, manufacturing, agricultural, or shopkeeping.

Railways.—Fife is crossed from Burntisland to Newport by the North British Railway between Edinburgh and Dundee; and from the main line branches diverge at Thornton to Dunfermline and Kinross, and to Leven and the east of Fife; at Markinch to Leslie; at Ladybank to Auchtermuchty and Kinross and to Perth; and at Leuchars to St. Andrews.

Population.—The total population of the county in 1871 was 160,735, of whom 75,127 were males and 85,608 females. The population in 1861 was 154,770. In the towns the population in 1871 was 73,929 as compared with 66,516 in 1861, in the villages 47,759 as compared with 41,627, and in the rural districts 39,047 as compared with 46,627.

One member of parliament is returned by the county; one each by the Kirkcaldy and St. Andrews districts of burghs; and Dunfermline and Inverkeithing are grouped with other boroughs under the Stirling district in returning a fourth.

History and Antiquities.—A dim conception of the kingdom of Fife at a period regarding which there are scanty written records may be obtained from its somewhat important and interesting archæological remains. Those of greatest antiquity are perhaps two canoes found more than 60 years ago in the bed of the Tay opposite Lindores; the relics of the *Bos primigenius*, an inhabitant of the primeval forest; and the remains of many of the ancient hill forts—chief of which may be mentioned those at Norman's Law and on the Craig of Clachard, both in the parish of Abdie—constructed at a period in all probability considerably anterior to the Roman invasion. Traces yet exist in several places of the foundations of those circular tent-like dwellings noticed by Julius Cæsar in other parts of Britain as identical with those of the Gauls of the continent of Europe. The marks of Roman occupation are now nearly all obliterated by cultivation, but sword blades, spear heads, and hoards of Roman coins have been found at various places; and vestiges of a number of Roman buildings were in existence 100 years ago. According to Sir Robert Sibbald, traces of Roman camps were in his lifetime visible near Burntisland and Dunfermline; and slight marks of two yet remain in the parish of Carnock at a place known by the name of the Camp Farm. At Lochore, near a place now occupied by the farm of Chapel, there existed about a century ago the outlines of a permanent Roman station of considerable strength, and occupying a central position on the route between Queensferry and the firth of Tay. It was near this fortification that in all probability took place the night attack on the ninth legion, mentioned by Tacitus in the 25th chapter of his *Agricola*.

The earliest inhabitants of Fife and Strathearn of whom we have any knowledge were of Celtic origin, and were called by the Romans Horesti. It is uncertain when the Romans retired from this district, but they did not occupy it for a length of time sufficient to effect any marked change on the civilization of the natives, who made frequent incursions into the Roman province, and received from their Romanized neighbors the name of Picti, the part of Scotland north of the Forth being known as Pictavia so late as the 8th century. The title kingdom ultimately inherited by Fife was doubtless applied in the first instance to the whole of Pictavia; and the continuance of the title to a smaller portion, of which the present Fife forms the eastern half, was due as much to its being the southern part of Pictavia as to its distinct peninsular form, and to the fact that Pictish kings had their residence within its territories. In any case the title as applied to Fife has the sanction of very ancient usage. In the tract of the *Scots of Dalriada* there occur the words the "men of Fife in the sovereignty;" and in Wynton's *Chronicle*, whose date is 1380, Fife is spoken of as a "kynrick" or kingdom. The power and influence of the thanes of Fife, and the existence afterwards of royal residences at Dunfermline and Falkland, doubtless aided in continuing the title down to later times. The first trace of the name Fife occurs in the old verses ascribed to St. Columba, where, under the form *Fif*, it is used as the designation of one of the seven provinces into which, according to Beda, the ancient kingdom of Pictavia was divided. As to the exact boundaries of Fife at this period there is no certain information, but in all probability it comprehended the greater part of the territory between the Forth and the Tay, thus including Monteith, Strathearn, and the shires of Clackmannan and Kinross, but probably in its south-western part ceding a portion of its present area to the province of Fortreim. At a later period Fife was divided into the "stewartries" of Clackmannan, Culross, and Kinross; and about 1426 Kinross was divided into the shires of Kinross and Fife. In 1685 the parishes of Orwell, Tulliebole, and Cleish were disjoined from Fife and added to Kinross. The term *Fiv* seems identical with the Jutland word *Fibh* (pronounced exactly as *Fife* is now pronounced), meaning forest, and was probably first made use of by the Frisians to designate the country immediately interior to the estuaries of the Tay and Forth, where an immigration of Frisian tribes took place about the end of the 4th century.[1] Evidence of a Danish settlement subsequent to the Frisian immigration is presented in the names of several of the homesteads, as well as in the presence of the word *Law* (Danish *Hleaw*, a heaped-up mound marking the graves of illustrious dead) in Norman's Law, Largo Law, Norris Law, and several other hills. On a mound at Norris Law a complete set of silver armor was discovered about 1817, but it found its way to the melting pot before its antiquarian importance was recognized. Several relics found along with it have, however, been preserved, and they are graven with symbols similar to those of the oldest sculptured stones, one of which yet exists at Lindores, and contains no Christian figures. The standing stones of Lundin, near Leven, are, according to the tradition of the district, the burial stones of Danish chiefs who fell in a battle which took place in the immediate neighborhood. Of the sculptured stones erected subsequent to the teaching of St. Columba, which are either cruciform or graven with a large cross, there are, besides several fragment at different places, four standing in a pretty entire condition, viz., at Docton Kinglassie, at Abercromby, at Sauchope near Crail, and at Mugdrum near Newburgh. Still more interesting memorials of the early Christian missionaries are the crosses and other figures graven on the walls of the numerous caves which exist along the coast from St. Andrews to Dysart.[2] After the time of the Culdees the next archæological relic of importance is the pedestal of the cross of Macduff near Newburgh, erected by the thane of Fife after his escape from the vengeance of the usurper Macbeth.

Monastic foundations were pretty numerous in Fife. On the island of Inchkolm there yet stand the cloister, prison, refectory, and chapter-house of an abbey of the Canons Regular, founded in 1213; and the same order possessed priories at Pittenweem (of which there are yet interesting ruins), at St. Andrews (founded in 1221), and in the Isle of May (1141). Convents of the Dominicans existed at Cupar, at St. Monans (1369), and St. Andrews (1274). The Benedictines founded Dunfermline Abbey in 1214; and Lindores Abbey, which, from the few architectural details now left, must have been of great elegance, owed its origin to the Tyronenses in 1178. Balmerino Abbey, of which there yet exist the roofless walls of the chapter-house with the cloisters, was founded by the White Cistercians in 1229. The Franciscans had a monastery at Inverkeithing; an Observantine convent was founded at St. Andrews in 1478; and one of the only two nunneries of the Clarisses in Scotland existed at Aberdour. The churches of Crail (1517), Kirkheugh, and St. Salvators (1450) were collegiate churches; St. Monans possesses a fine Gothic church of the Middle Pointed style, built about 1365, and restored in 1828; a fine old Norman church still stands at Aberdour; there are ruins of an old church at Abdie consecrated in 1242; and the semicircular apse of an old Norman structure forms part of the present parish church at Leuchars. Further particulars regarding the ecclesiastical antiquities of Fife will be found in the accounts of the different burghs.

Among the old castles not mentioned under the names of burghs the principal are the ruins of Balcomie Castle, near the East Neuk, where stress of weather compelled Mary of Guise to land in 1538; two square towers of an old building near East Wemyss, said to have been the residence of Macduff; the present castle of Wemyss—a plain building with an old castellated wing—where Queen Mary met her future husband Darnley; the ruin of Ravenscraig, near Dysart, referred to in Sir Walter Scott's ballad of "Rosabelle"; the ruined tower of the old castle of Balwearie, near Kirkcaldy, the birthplace of Sir Michael Scott the astrologer; the square tower of the old castle of Rosythe, near Inverkeithing, visited by Oliver Cromwell when in Fife; the castellated mansion of Aberdour, at one time the residence of James, fourth earl of Morton; the fortress of Lochore, built in the time of Malcolm Canmore; the old stronghold of Balgonie; part of the round tower of the old castle of Creich, the residence of the Beatons, and the birthplace of Mary Beaton, one of the "four Maries" of Mary Queen of Scotland; Ballinbreich Castle, in the parish of Flisk, for a long time the residence of the earls of Rothes; and the ruined castle of Dairsie, where, it is said, Archbishop Spottiswoode wrote his history.

Among the modern residences of the gentry may be mentioned Raith House (Col. Ferguson), built by Lord Raith in the 17th century, a plain building, finely situated on an elevated plateau; Balcarres House (Sir Coutts Lindsay), a baronial structure lately enlarged, with fine terraced gardens in front; Balcaskie House (Sir Robert Anstruther) with terraced gardens in the French style; Falkland House (Tyndall Bruce), a fine mansion in the Elizabethan style, and beautifully situated at the base of the East Lomond; Donibristle (Earl of Moray), and Dysart House (Earl of Rosslyn), both romantically situated close on the sea-shore; Leslie House (Hon. G. Waldegrave Leslie), at one time one of the largest mansions in Scotland, but on account of a fire now only a fourth of its original size, containing a gallery with portraits of the successive earls of Rothes and many of their contemporaries; Largo House, where at one time was the patrimony of Sir Andrew Wood; Inchdairnie (Roger Sinclair Aytoun), a fine mansion in the Scotch baronial style; Crawford Priory (Earl of Glasgow), a castellated mansion lately greatly enlarged; and Mount Melville (J. Whyte Melville).

On account of its isolated situation, Fife, except at the Reformation and during the times of the Covenanters, has not been prominently connected with the eventful periods of later Scottish history, the only circumstances worthy of mention being the battle of Dalcearrens Field, near Lindores, in which Sir William Wallace, in June, 1300, inflicted a heavy defeat on the English; the capture in 1651 of Burntisland by the soldiers of the Commonwealth, who garrisoned the town for several years, and in this way kept a check on the Royalist sympathizers of the "kingdom;" the landing of the earl of Mar at Elie in 1715 to take part in the Jacobite insurrection; and the arrival shortly afterwards of 4000 of the insurgents with the view of crossing from Fife in boats to join the southern army. Among the eminent persons connected with Fife may be mentioned Sir David Lindsay of the Mount, Sir Michael Scott the astrologer, the parliamentary general Leslie, Lord Leven, Sir David Wilkie, Adam Smith, Thomas Chalmers, Lord Chancellor Campbell, Mrs. Somerville, and the seventh and eighth earls of Elgin.

Sir Robert Sibbald's *History of the Sheriffdoms of Fife and Kinross* is chiefly of value for the information it contains regarding the condition of Fife at the period of the writer. Varied information regarding the history and antiquities of the shire will be found in Alex. Campbell's *Journey from Edinburgh through Fifeshire*, 1805; Rev. A. Small's *Roman Antiquities in Fifeshire*, 1823; Rev. J. W. Taylor's *Historical Antiquities of Fife*, 1875; and Rev. W. Wood's *East Neuk of Fife*, 1862. See also Swan's *Views of Fife;* the beautifully illustrated *Shores of Fife*, edited by Wm. Ballingall, 1872; and an interesting article on the "Kingdom of Fife," in *Fraser's Magazine* for January, 1878. (T. F. H.)

FIFTH MONARCHY MEN, a Puritan sect who supported Cromwell's government in the expectation that it was a preparation for the "fifth monarchy,"—that is, the monarchy which should succeed the Assyrian, the Persian, the Grecian, and the Roman, and during which Christ should reign with his saints on earth for a thousand years. Being disappointed at the delay in the fulfilment of their hopes, they attempted to foment a political agitation against the government of Cromwell, but the arrest of Feake and Powell, two of the most violent of their number, was sufficient for a time to damp their ardor, and they were content to nourish their dreams in secret until after the Restoration, when, on January 6, 1661, fifty of them, headed by a wine-cooper named Venner, made a mad effort to attain possession of London in the name of "King Jesus." Most of the fifty were either killed or taken prisoners, and on January 19 and 21 Venner and ten others were executed for high treason. From that time the special doctrines of the sect either died completely out, or became merged in a milder form of millenarianism similar to that which still exists at the present day.

[2] See notes on the sculptured caves near Dysart, by Miss C. M'Lagan, in vol. xi. of the *Proceedings of the Society of Antiquaries of Scotland;* and *Archaic Sculptures of Cups and Circles*, by Sir James Y. Simpson, 1867.

FIG, the popular name given to plants of the genus *Ficus*, an extensive group, included in the natural order *Moraceæ*, and characterized by a remarkable development of the pear-shaped receptacle, the edge of which curves inwards, so as to form a nearly closed cavity, bearing the numerous fertile and sterile flowers mingled on its surface (see BOTANY, fig. 150). The figs vary greatly in habit,—some being long trailing shrubs, others gigantic trees, among the most striking forms of those tropical forests to which they are chiefly indigenous. They have alternate leaves, and abound in a milky juice, usually acrid, though in a few instances sufficiently mild to be used for allaying thirst. This juice contains caoutchouc in large quantity.

Ficus Carica, which yields the well-known figs of commerce, is a bush or small tree, rarely more than 18 or 20 feet high,—with broad, rough, deciduous leaves, very deeply lobed in the cultivated varieties, but in the wild plant sometimes nearly entire. The green, rough branches bear the solitary, nearly sessile receptacles in the axils of the leaves. The male flowers are placed chiefly in the upper part of the cavity, and in most varieties are few in number. As it ripens, the receptacle enlarges greatly, and the numerous single-seeded pericarps become imbedded in it. The fruit of the wild fig never acquires the succulence of the cultivated kinds. The fig seems to be indigenous to Asia Minor and Syria, but now occurs in a wild state in most of the countries around the Mediterranean. From the ease with which the nutritious fruit can be preserved, it was probably one of the earliest objects of cultivation, as may be inferred from the frequent allusions to it in the Hebrew Scriptures. From a passage in Herodotus the fig would seem to have been unknown to the Persians in the days of the first Cyrus; but it must have spread in remote ages over all the districts around the Ægean and Levant. The Greeks are said to have received it from Caria (hence the specific name); but the fruit so improved under Hellenic culture that Attic figs became celebrated throughout the East, and special laws were made to regulate their exportation. From the contemptuous name given to informers against the violation of those enactments, *συκοφάνται* (*σῦκον* and *φαίνω*), our modern word sycophant is traced. The fig was one of the principal articles of sustenance among the Greeks; the Spartans especially used it largely at their public tables. From Hellas, at some prehistoric period, it was transplanted to Italy, and the adjacent islands. Pliny enumerates many varieties, and alludes to those from Ebusus (the modern Iviça) as most esteemed by Roman epicures; while he describes those of home growth as furnishing a large portion of the food of the slaves, particularly those employed in agriculture, by whom great quantities were eaten in the fresh state at the periods of fig-harvest. In Latin myths the plant plays an important part. Held sacred to Bacchus it was employed in religious ceremonies; and the fig-tree that overshadowed the twin founders of Rome in the wolf's cave, as an emblem of the future prosperity of the race, testified to the high value set upon the fruit by the nations of antiquity. The tree is now cultivated in all the Mediterranean countries, but the larger portion of our supply of figs comes from Asia Minor, the Spanish Peninsula, and the south of France. Those of Asiatic Turkey are considered the best. The varieties are extremely numerous, and the fruit is of various colors, from deep purple to yellow, or nearly white. The trees usually bear two crops,—one in the early summer from the buds of the last year, the other in the autumn from those on the spring growth; the latter forms the chief harvest. Many of the immature receptacles drop off from imperfect fertilization, which circumstance has led, from very ancient times, to the practice of *caprification*. Branches of the wild fig in flower are placed over the cultivated bushes. Certain hymenopterous insects, of the genera *Blastophaga* and *Sycophaga*, which frequent the wild fig, enter the minute orifice of the receptacle, apparently to deposit their eggs; conveying thus the pollen more completely to the stigmas, they insure the fertilization and consequent ripening of the fruit. By some the nature of the process has been questioned, and the better maturation of the fruit attributed merely to the stimulus given by the puncture of the insect, as in the case of the apple; but the arrangement of the unisexual flowers in the fig renders the first theory the more probable. In some districts a straw or small twig is thrust into the receptacle with a similar object. When ripe the figs are picked, and spread out to dry in the sun,—those of better quality being much pulled and extended by hand during the process. Thus prepared, the fruit is packed closely in barrels, rush baskets, or wooden boxes, for commerce. The best kind, known as elemi, are shipped at Smyrna, where the pulling and packing of figs form one of the most important industries of the people.

This fruit still constitutes a large part of the food of the natives of western Asia and southern Europe, both in the fresh and dried state. A sort of cake made by mashing up the inferior kinds serves in parts of the Archipelago as a substitute for bread; mixed with almonds, a similar preparation is sold in the streets of our large towns, and eaten as a luxury by the poor, under the name of "fig-cake." Alcohol is obtained from fermented figs in some southern countries; and a kind of wine, still made from the ripe fruit, was known to the ancients, and mentioned by Pliny under the name of *sycites*. Medicinally the fig is employed as a gentle laxative, when eaten abundantly often proving useful in chronic constipation; it forms a part of the well-known "confection of senna." Cut open, the fruit is a popular cataplasm for boils and sores, an application as old as the days of Hezekiah. It is recommended as a demulcent in disorders of the throat, being given in the form of decoction. The milky juice of the stems and leaves is very acrid, and has been used in some countries for raising blisters. The wood is porous and of little value; though a piece, saturated with oil and spread with emery, is in France a common substitute for a hone.

The fig is grown for its fresh fruit (eaten as an article of dessert) in all the milder parts of Europe, and in the United States, with protection in winter, succeeds as far north as Pennsylvania. In England it is usually trained against a wall, and sheltered with mats or branches in severe frosts, though in some warm places near the southern coast small plantations of standard bushes exist; one of the oldest is probably that at Tarring, near Worthing. The tree is propagated by cuttings or layers; it requires care in pruning, and the immature fruit, formed late in summer, should be removed to strengthen the shoots. The crop ripens in August and September. The fig was introduced into England by Cardinal Pole, from Italy, early in the 16th century.

The Sycamore Fig, *Ficus Sycomorus*, is a tree of large size, with heart-shaped leaves, which, from their fancied resemblance to those of the mulberry, gave origin to the name *Συκόμορος*. From the deep shade cast by its spreading branches, it is a favorite tree in Egypt and Syria, being often planted along roads and near houses. It bears a sweet edible fruit, somewhat like that of the common fig, but produced in racemes on the older boughs. The apex of the fruit is sometimes removed, or an incision made in it, to induce earlier ripening. The ancients, after soaking it in water, preserved it like the common fig. The porous wood is only fit for fuel.

The Sacred Fig, Pippul, or Bo, *Ficus religiosa*, a large tree with heart-shaped, long-pointed leaves on slender footstalks, is much grown in southern Asia. The leaves are used for tanning, and afford lac, and some caoutchouc is obtained from the juice; but in India it is chiefly planted with a religious object, being regarded as sacred by both Brahmans and Buddhists. The former believe that the last avatar of Vishnu took place beneath its shade. A gigantic bo, described by Emerson Tennent as growing near Anarajapoora, in Ceylon, is, if tradition may be trusted, one of the oldest trees in the world. It is said to have been a branch of the tree under which Gautama Buddha became endued with his divine powers, and has always been held in the greatest veneration. The figs, however, hold as important a place in the religious fables of the East as the ash in the myths of Scandinavia.

Ficus elastica, the India-rubber Tree, the large, oblong, glossy leaves, and pink buds of which are so familiar in our greenhouses, furnishes most of the caoutchouc obtained from the East Indies. It grows to a large size, and is remarkable for the snake-like roots that extend in contorted masses around the base of the trunk. The small fruit is unfit for food. For the BANYAN see vol. iii. p. 300.

The trade in the edible fig is one of long standing, and of considerable importance in the regions devoted to the cultivation of the tree. Figs are easily preserved by simply drying in the sun, the grape sugar which they contain in abundance being thus rendered available for their preservation. Recently the practice of preserving fresh undried figs in tins has been adopted, but the amount used in that form is as yet insignificant compared with the quantities preserved by drying. Of the dried and pressed fruit the import into Great Britain alone averages from six to seven thousand tons annually, the following being the official returns for the five years ended 1876:—

	Cwts.	Value.	Duty.
1872	141,847	£231,571	£38,885
1873	120,347	220,413	35,021
1874	74,168	149,089	23,685
1875	124,609	252,022	32,749
1876	163,163	318,717	39,925

The greater part (about four-fifths) of these imports comes from Asia Minor, the remainder being produced in various Mediterranean countries. (C. P. J.)

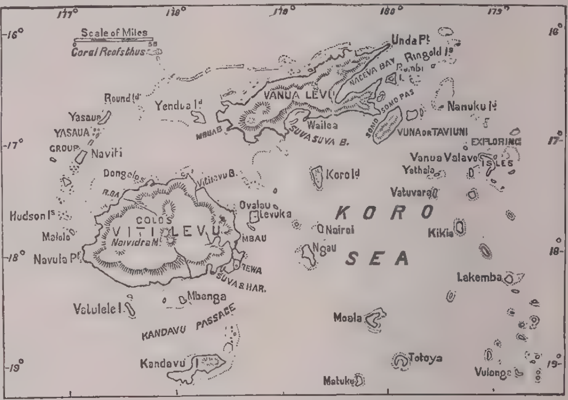
FIGARO, a famous dramatic character first introduced on the stage by Beaumarchais in the *Barbier de Séville*, the *Mariage de Figaro*, and the *Folle Journée*. The name is said to be an old Spanish and Italian word for a wigmaker, connected with the verb *cigarrar*, to roll in paper. Many of the traits of the character are to be found in earlier comic types of the Roman and Italian stage, but as a whole the conception was marked by great originality; and Figaro soon seized the popular imagination, and became the recognized representative of daring, clever, and nonchalant roguery and intrigue. Almost immediately after its appearance, Mozart chose the *Marriage of Figaro* as the subject of an opera, and the *Barber of Seville* was treated first by Parsiello, and afterwards in 1816 by Rossini. In 1826 the name of the witty rogue was taken by a journal which continued till 1833 to be one of the principal Parisian periodicals, numbering among its contributors such men as Jules Janin, Paul Lacroix, Léon Gozlan, Alphonse Karr, Dr. Veron, Jules Sandeau, and George Sand. Various abortive attempts were made to restore the *Figaro* during the next twenty years; and at length in 1854 the efforts of M. Villemessant were crowned with success. The new journal not only still exists, but has attained unusual popularity.

See Marc Monnier, *Les Aieux de Figaro*, 1868; H. de Villemessant, *Mémoires d'un Journaliste*, 1867.

FIGEAC, a town of France, capital of an arrondissement in the department of Lot, is situated on the right bank of the Selle, 32 miles N.E. of Cahors. It is enclosed by an amphitheatre of wooded and vine-clad hills, but is ill-built, and its streets are narrow and dirty. Many of the buildings are remarkable for their antique style. It was formerly surrounded by ramparts and ditches, but these were demolished in 1622, though remains of them still exist. Figeac has linen and cotton manufactures, dyeworks, and tanneries, and also a considerable trade in cattle and wine. Among the public edifices worthy of notice are the communal college, the hospital, the abbey church of St. Sauveur, the church of Notre Dame du Puy, and the Château de la Baleine, now transformed into a law court, but still retaining its feudal exterior. At the south and west extremities of the town are two obelisks called *les aiguilles*, octagonal in form, and upwards of 50 feet in height, which were used in former times as fire beacons to guide travellers by night. Champollion the archæologist was born at Figeac in 1790, and an obelisk has been erected to his memory near the river. The town owes its origin to a Benedictine abbey founded by Pepin the Short in 755. It was besieged by the Huguenots in 1568 without success, but was conquered by them in 1576, and remained one of their chief fortresses till 1622. The population in 1876 was 5660.

FIGUERAS, a frontier town of Spain, in the province of Gerona, and 20 miles W.N.W. of the town of that name. It is a straggling town, situated in a rich plain of olives and rice. It possesses a beautiful parish church, two monasteries, and a hospital. The principal manufactures are leather and paper, and it has some trade with France. The citadel, an irregular pentagonal structure on the principles of Vauban, is considered one of the strongest fortresses in Europe. It was built by Ferdinand VI., and its situation renders it the key to the frontier. Its cost amounted to £285,000, and it contains accommodation for 16,000 men and 500 horses. The buildings inside the walls are all bomb-proof, and the natural adaptation of its situation has been so taken advantage of that trenches can scarcely be opened on any side, the ground being everywhere rocky. In 1794 it was surrendered to the French, but it was retaken in 1795. It was again captured by the French in 1808, and though they were forced to vacate it in 1811, they recaptured it on the 19th August of the same year. In 1813 they were again driven out, but it again capitulated to them in 1823. The population of Figueras is about 10,000.

FIJI ISLANDS. The Fiji, or more correctly Viti, archipelago (Fiji being the pronunciation in the eastern part of the group frequented by the Tongans) is one of the most important in the South Pacific. Its nearest neighbors are the Samoan group 300 miles to the N.E., and the Tongan or Friendly rather nearer to the S.E. Lying between 177° E. and 178° W. long., and between 15° 40′ and 20° S. lat., it is beyond the limits of the perpetual S.E. trades, while not within the range of the N.W. monsoons. From April to November the winds are steady between S.E. and E.N.E., after which the weather becomes uncertain and the winds often northerly. In February and March heavy gales are frequent, and hurricanes sometimes occur, causing scarcity by destroying the crops. The rainfall is much greater on the windward than on the lee sides of the islands (108 inches at Levuka), but the mean temperature is much the same, viz., about 80° F. The greatest rise and fall of the tide is six feet. The islands cover an area of some 7400 square miles, or about that of Wales. Excluding the two large islands, they are classed by the natives in three groups, viz., the "Lau" or Windward Islands, mostly small, but many of them very fertile, of which Lakemba is the most important; "Loma-i-Viti," or Inner Fiji, *i.e.*, the islands inclosed between the Lau and the two great islands Viti Levu (Great Viti) and Vanua Levu (Great Land); and the "Ra" or Leeward Islands, a chain of numerous small islands bounding the group to the westward.



Map of Fiji Islands.

Scenery.—There is not much level country, except in the small coral islets, and certain rich tracts along the coasts of the two large islands, especially near the mouths of rivers. Elsewhere hill and valley, peak and precipice, assume the most romantic forms, clothed almost always with a beautiful and luxuriant vegetation. The large islands have a considerable extent of undulating country, dry and open on their lee sides; the peaks rise from 4000 to 5000 feet.

Climate and Diseases.—The climate, especially from November to April, is somewhat enervating to the Englishman, but not unhealthy. Fevers are hardly known. Dysentery, which is very common, and the most serious disease in the islands, is said to have been unknown before the advent of Europeans. Elephantiasis is common, but is curable by removal into higher and better air. It is sometimes produced by immoderate use of kava. Influenza is at times prevalent and very fatal. Rheumatism is common. The natives have a bad skin disease, thoko, affecting also the bones, from which few escape; but it is said to be avoidable by a sounder hygiene.

Rivers.—Streams and rivers are abundant,—the latter very large in proportion to the size of the islands, affording a water-way to the rich districts along their banks. These and the extensive mud flats and deltas at their mouths are often flooded, by which their fertility is increased, though at a heavy cost to the cultivator.

Geological Formation.—The geological features of the group point to repeated volcanic action at considerable intervals. The tops of many of the mountains, from Kandavu in the S.W., through Nairai and Koro, to the Ringgold group in the N.E., have distinct craters, but their activity has long ceased. The various decomposing volcanic rocks—tufas, conglomerates, and basalts—mingled with decayed vegetable matter, and abundantly watered, form a very fertile soil. Most of the high peaks on the larger islands are basaltic, and the rocks generally are igneous, with occasional upheaved coral found sometimes over 1000 feet above the sea; but certain sedimentary rocks observed on Viti Levu seem to imply a nucleus of land of considerable age. Hot springs occur on Viti Levu, on Ngau, at Wainunu and Savu-Savu on Vanua Levu; the last have a temperature of 200°–210° F., and cover an area of half a square mile. Earthquakes are occasionally felt. Volcanic activity in the neighborhood is further shown by the quantities of pumice-stone drifted on to the south coasts of Kandavu and Viti Levu; malachite, antimony, and graphite, gold in small quantities, and specular iron-sand occur.

Islands.—The islands number about 250, of which perhaps 80 are inhabited. Viti Levu, about 80 by 55 miles, is the largest and most important from its fertility and variety of surface, number of large rivers, and population,—which is about one-third of that of the whole group. Vanua Levu, somewhat smaller, about 100 by 25 miles, and less fertile and populous, has good anchorages along its entire south coast. All the others are much smaller. Taviuni, 25 by 5 miles, with a central ridge 2100 feet high and a lake at the top, is fertile, but exceptionally devoid of harbors. Kandavu, 25 miles long and very narrow, well-timbered, with a good harbor, contains a Wesleyan training institution and model village. Fulanga and Kambara are well-timbered and frequented by canoe-builders. Totoya, Moala, Ngau, Mbengga, Nairai, Koro, are all valuable islands (the last especially fertile), 15 to 30 miles in circumference. The Wilson or Exploring group consists of seven islands of considerable size, well situated for the resort of vessels, with anchorages safe and easily reached, and supplies abundant. The navigation between the islands is in many places intricate, but the dangers can be much lessened by good surveys, careful pilotage, and increased use of steam. There are good anchorages inside the barrier reefs; the best harbors are those of Suva in Viti Levu, Savu-Savu and Mbua or Sandalwood Bays in Vanua Levu, Galoa Bay in Kandavu, and Levuka.

Vegetation.—The vegetation is mostly of a tropical Indo-Malayan character,—thick jungle with great trees covered with creepers and epiphytes. The lee sides of the larger islands, however, have grassy plains suitable for grazing, with scattered trees, chiefly *Pandanus*, and ferns. The flora has also some Australian and New Zealand affinities (resembling in this respect the New Caledonia and New Hebrides groups), shown especially in these western districts by the *Pandanus*, by certain acacias, epacrids, *Casuarinæ*, and *Dammara*, and by the peculiar habit of other species. At about 2000 feet the vegetation assumes a more mountain type.

Among the many valuable timber trees are the vesi (*Afzelia bijuga*); the dilo (*Calophyllum Inophyllum*), the oil from its seeds being much used in the islands, as in India, in the treatment of rheumatism; the dakua (*Dammara Vitiensis*) allied to the New Zealand kauri; the vaivai (*Serianthes Vitiensis*), the *Casuarina*, and others, chiefly conifers, Guttiferæ, Myrtaceæ, and Leguminosæ. Most of the fruit trees are also valuable as timber. The native cloth (masi) is beaten out from the bark of the paper-mulberry (*Broussonetia papyrifera*), cultivated for the purpose. Several useful fibres are supplied by plants of the Musaceæ, Bromelideæ, Thymeleæ, and other orders. Of the palms the cocoa-nut is by far the most important. Dr. Seemann discovered a sago-palm known to the natives by the name of sogu, though they were then ignorant of its use. The yasi or sandalwood is now rarely found, and only in a small district at the western extremity of Vanua Levu. There are various useful drugs, spices and perfumes; and many plants are cultivated for their beauty, to which the natives are keenly alive. Among the plants used as pot-herbs are several ferns, and two or three Solanums, one of which, *S. anthropophagorum*, allied to our *S. nigrum*, was one of certain plants always cooked with human flesh, which is said to be otherwise difficult of digestion. The use of the kava root, here called yanggona (*Macropiper methysticum*), from which the well-known national beverage is made, was introduced, it is said, from Tonga.

Of fruit-trees, besides the cocoa-nut, we can only mention the many varieties of the bread-fruit, of bananas and plantains, of sugar-cane and of *Citrus;* the wi (*Spondias dulcis*), the kavika (*Eugenia malaccensis*), the ivi or Tahitian chestnut (*Inocarpus edulis*), the pine-apple, and others recently introduced. Edible roots are especially abundant. The chief staple of life is the yam, the names of several months in the calendar having reference to its cultivation and ripening. The *Dioscorea alata* is the variety chiefly planted; its roots are sometimes 8 feet long and 100 ℔ in weight. The kawai (*D. aculeata*) is also a very fine esculent, and there are several wild species. The yaka, which also grows wild, is a papilionaceous creeper (*Pachyrhizus angulatus*), with roots 6 to 8 feet long and as thick as a man's thigh; it is also much valued for its fibre. The taro or dalo (*Colocasia esculenta*) is grown in ditches, by streams, or on irrigated ground; and there are other aroideous plants growing wild, with huge edible corms. The natives use no grain or pulse, but make a kind of bread (*mandrai*) from the above roots, as well as from the banana (which is the best), the bread-fruit, the ivi, the kavika, the arrow-root (*Tacca pinnatifida* and *T. sativa*), and in times of scarcity the mangrove. This bread is made by burying the materials for months, till the mass is thoroughly fermented and homogeneous, when it is dug up and cooked by baking or steaming. This simple process, applicable to such a variety of substances, is a valuable security against famine.

The islands are well suited to sugar, maize, coffee, cotton (which here becomes a perennial several feet high), tobacco, manilla, india-rubber, etc.

Animals.—Besides the dog and the pig, which (with the domestic fowl) must have been introduced into the Pacific islands in very early ages, the only land Mammalia are a rat and five species of bats. Insects are numerous, but the species few. Of 41 species of land birds, 17, Mr. Wallace says, are characteristic of the Australian region, 9 peculiarly Polynesian, and 15 belong to wide-spread genera. Birds of prey are few; the parrot and pigeon tribes are better represented; of 15 aquatic species only one is peculiar. Fishes, of an Indo-Malay type, are numerous and varied; Mollusca, especially marine, and Crustaceæ are also very numerous. These three form an important element in the food supply.

Exports.—Numbers of cocoa-nuts have been planted, and the export of copra (the dried kernel of the nut) is rapidly increasing. The chief exports in 1876 were—copra £41,900, sugar £9036, maize £8465,—which are all on the increase; cotton £11,922, and bêche-de-mer £2491, which have decreased; coir £2727, pearl-shell, and arrow-root. The value of exports from Levuka was £80,890, of imports £112,806. The customs returns were estimated at £15,000; the native land revenue was assessed at £22,000. The revenue of 1878 is estimated at £60,000.

People.—The Fijian character was till lately proverbial for every savage abomination. Cannibalism, if fenced round at one time by religious sanctions, had degenerated to a morbid craving recklessly indulged whenever possible. Shipwrecked or helpless strangers were nearly always killed and eaten. Widows were strangled at the death of their husbands, slaves killed at the death of their masters; victims were slain in numbers at the building of a house or of a canoe, or at the visits of embassies from other tribes. The lives of individuals were always subject to the caprices of the chiefs. In the atmosphere of suspicion and treachery thus engendered few virtues could be developed. Yet the people were always hospitable, open-handed, and remarkably polite. They themselves attribute to affection the practice of killing their sick or aged relations. They are sensitive, proud, vindictive, boastful, cleanly in their houses, cookery, etc., with good conversational and reasoning powers, much sense of humor, tact, and perception of character. Their code of social etiquette is minute and elaborate, and the gradations of rank well-marked These are—1, chiefs, greater and lesser; 2, priests; 3, *Mata ni Vanua* (lit., eyes of the land), employés, messengers, or counsellors; 4, distinguished warriors of low birth; 5, common people; 6, slaves.

Political Institutions.—The family is the unit of political society. The families are grouped in townships or otherwise (*qali*) under the lesser chiefs, who again owe allegiance to the supreme chief of the *matanitu* or tribe. The chiefs are a real aristocracy, excelling the people in physique, skill, intellect, and acquirements of all sorts; and the reverence felt for them, now gradually diminishing, was very great, and had something of a religious character. All that a man had belonged to his chief. On the other hand, the chief's property practically belonged to his people, and they were as ready to give as to take. In a time of famine, a chief would declare the contents of the plantations to be common property. A system of feudal service-tenures (*lala*) is the institution on which their social and political fabric mainly depended. It allowed the chief to call for the labor of any district, and to employ it in planting, house or canoe building, supplying food on the occasion of another chief's visit, etc. This power was often used with much discernment; thus an unpopular chief would redeem his character by calling for some customary service and rewarding it liberally, or a district would be called on to supply labor or produce as a punishment. The privilege might of course be abused by needy or unscrupulous chiefs, though they generally deferred somewhat to public opinion; it has now, with similar customary exactions of cloth, mats, salt, pottery, etc., been reduced within definite limits. An allied custom, *solevu*, enabled a district in want of any particular article to call on its neighbors to supply it, giving labor or something else in exchange. Although, then, the chief is lord of the soil, the inferior chiefs and individual families have equally distinct rights in it, subject to payment of certain dues; and the idea of permanent alienation of land by purchase was never perhaps clearly realized.[1] Another curious custom was that of *vasu* (lit., nephew). The son of a chief by a woman of rank had almost unlimited rights over the property of his mother's family, or of her people.

War.—In time of war the chief claimed absolute control over life and property. Warfare was carried on with many courteous formalities, and considerable skill was shown in the fortifications. There were well-defined degrees of dependence among the different tribes or districts: the first of these, *bati*, is an alliance between two nearly equal tribes, but implying a sort of inferiority on one side, acknowledged by military service; the second, *qali*, implies greater subjection, and payment of tribute. Thus A, being bati to B, might hold C in qali, in which case C was also reckoned subject to B, or might be protected by B for political purposes.

Religion. — The people are now almost all Christians. Their former creed, which had much in common with the Polynesian, included a belief in a future existence, and in two classes of gods,—the first immortal, of whom Ndengei is the greatest, said to exist eternally in the form of a serpent, but troubling himself little with human or other affairs, and the others had usually only a local recognition. The second rank (who, though far above mortals, are subject to their passions, and even to death) comprised the spirits of chiefs, heroes, and other ancestors. The gods entered and spoke through their priests, who thus pronounced on the issue of every enterprise, but they were not represented by idols; certain groves and trees were held sacred, and stones which suggest phallic associations. The priesthood usually was hereditary, and its influence great, and it had generally a good understanding with the chief. The institution of Tabu existed in full force. The mburé or temple was also the council-chamber and place of assemblage for various purposes.

Customs.—They have various games and amusements, dancing, story-telling, and songs being especially popular. Their poetry has well-defined metres, and a sort of rhyme. Their music is rude, and is said to be always in the major key. The excellence of their pottery favors a good and varied cuisine, and they have great and elaborate feasts; the preparations are sometimes made months in advance, and enormous waste results from them. Mourning is expressed by fasting, by shaving the head and face, or by cutting off the little finger. This last is sometimes done at the death of a rich man in the hope that his family will reward the compliment; sometimes it is done vicariously, as when the chief cuts off the little finger of his dependants in regret or in atonement for the death of another. Only the women are tattooed.[2]

Houses.—The houses, of which the framework is timber and the rest lattice and thatch, are ingeniously constructed, with great taste in ornamentation, and are well furnished with mats, mosquito-curtains, baskets, fans, nets, and cooking and other utensils.

Population.—The population forty years ago was about 200,000; it has since rapidly diminished, owing at first to the evils above described (aggravated probably by contact with the vicious European element), and afterwards to that fatal languor which so often accompanies the introduction of civilization, the deaths now outnumbering the births. Before the annexation to Britain (1874) there were about 140,000, but 40,000 fell victims to measles soon after. This diminution might perhaps be combated by the encouragement of their old athletic sports under an enlightened Christianity. The exact ethnological position of the people is a problem. They occupy the extreme east limits of Papuan territory, but far surpass the pure examples of that race, combining their dark color, harsh, hirsute skin, crisp hair,[3] and muscular limbs with the handsome features of the brown Polynesian race. They are tall and well-proportioned, the average physical development being much higher than our own. The features are strongly marked, but not unpleasant, the eyes deep-set, the beard thick and bushy. The chiefs are fairer, much better looking, and of a less negroid cast of face than the people. This negroid type is especially marked on the west coasts, and still more in the interior of Viti Levu. Many other characteristics of both races are found,—*e. g.*, the quick intellect of the fairer, and the savagery and suspicion of the dark; they wear a minimum of covering, but, unlike the Melanesians, are strictly decent, while they are more moral than the Polynesians. A partial circumcision is practised, which is exceptional with the Melanesians, nor have these usually an elaborate political and social system like that of Fiji. The status of the women is also somewhat better,—those of the upper class having considerable freedom and influence. Till taught by the Tongans they were, like other Melanesians, timid sailors. The prevalence of one language (though in several dialects) contrasts with the endless variety among the Melanesians. It is copious, flexible, vigorous, — fundamentally Melanesian, but largely modified in vocabulary and even in structure by the Polynesian. It has been argued from, among other considerations, the number of places with Tongan names, and from certain old Tongan traditions, that the ancestors of that people, in their migration from the west, were, after remaining a long time in Fiji, finally expelled thence by the aboriginal and darker race. Fijian traditions, however, point to no such movement, only asserting the greater unity of the race in former times, and placing even the creation of man, the scene of the deluge, and of the building of a tower of Babel, on Fijian soil. At all events, the Fijian is a well-established race, and the fusion of the elements which produced it certainly dates from a remote past.

If less readily amenable to civilizing influences than their neighbors to the eastward, they show greater force of character and ingenuity. Possessing the arts of both races, they practise them with greater skill than either. They understand the principle of division of labor and production, and thus of commerce. They are skilful cultivators and good boat-builders, the carpenters being an hereditary caste; there are also tribes of fishermen and sailors; their mats, baskets, nets, cordage, and other fabrics are substantial and tasteful; their pottery, made—like much of the above—by women, is far superior to any other in the South Seas, but, with many other native manufactures, is being supplanted by European articles.

---

[1] Of the 4½ million acres in Fiji, 854,956 acres, comprising all the best land, were purchased by whites before the annexation; but all the titles have not yet (1878) been confirmed.

[2] It will be understood that in the present state of transition some of the curious polity and customs here recorded are becoming obsolete.

[3] The elaborate mop into which the hair is trained (as among certain tribes in East Africa and elsewhere) has led to the belief that its peculiar appearance is due to irregular aggregations of the follicles, but this has been disproved.

History.—A few islands in the N.E. of the group were first seen by Tasman in 1643. The southernmost of the group, Turtle Island, was discovered by Cook in 1773. Bligh visited them in 1789, and Captain Wilson of the "Duff" in 1797. In 1827 D'Urville in the "Astrolabe" surveyed them much more accurately, but the first thorough survey was that of the United States exploring expedition in 1840.

Up to this time, owing to the evil reputation of the islanders, European intercourse was very limited. About the year 1804 some escaped convicts from Australia and runaway sailors established themselves around the east part of Viti Levu, and by lending their services to the neighboring chiefs probably led to their preponderance over the rest of the group. Na Ulivau, chief of the small island of Mbau, established before his death in 1829 a sort of supremacy, which was extended by his brother Tanoa, and by Tanoa's son, the well-known Thakombau, a ruler of considerable capacity. In his time, however, difficulties thickened. The Tongans, a Polynesian people 250 miles to the S.E. (see FRIENDLY ISLANDS), who had long frequented Fiji (especially for canoe-building, their own islands being deficient in timber), now came in larger numbers, led by an able and ambitious chief, Maafu, who, by adroitly taking part in Fijian quarrels, made himself chief in the Windward group, threatening Thakombau's supremacy. He was harassed, too, by an arbitrary demand for £9000 from the American Government, for alleged injuries to their consul. Several chiefs who disputed his authority were crushed by the aid of King George of Tonga, who (1855) had opportunely arrived on a visit; but he afterwards, taking some offence, demanded £12,000 for his services. At last Thakombau, disappointed in the hope that his acceptance (1854) of Christianity would improve his position, offered (1858) the sovereignty to England, with the fee simple of 100,000 acres, on condition of her paying the American claims. Colonel Smythe, R. A., was sent out to report on the question, and decided against annexation, but advised that the British consul should be invested with full magisterial powers over his countrymen, a step which would have averted much subsequent difficulty.

Meanwhile Dr. Seeman's favorable report on the capabilities of the islands, followed by a time of depression in Australia and New Zealand, led to a rapid increase of settlers—from 200 in 1860 to 1800 in 1869. This produced fresh complications, and an increasing desire among the respectable settlers for a competent civil and criminal jurisdiction. Attempts were made at self-government, and the sovereignty was again offered, conditionally, to England, and to the United States. Finally, in 1871, a "constitutional government" was formed by certain Englishmen under King Thakombau; but this, after incurring heavy debt, and promoting the welfare of neither whites nor natives, came after three years to a dead lock, and the British Government felt obliged, in the interest of all parties, to accept the unconditional cession now offered. It had besides long been thought desirable to possess a station on the route between Australia and Panama; it was also felt that the Polynesian labor traffic, the abuses in which had caused much indignation, could only be effectually regulated from a point so contiguous to the recruiting field, and where that labor was extensively employed. To this end the governor of Fiji is also "High Commissioner for the Western Pacific." Native laws, customs, and polity have been tenderly handled, and utilized, as far as possible, under the new rule. The chiefs are held responsible for good order, and for payment of the revenue. Certain higher chiefs, called "Roko Tuis," receive salaries, with executive and magisterial powers, assisted in the latter function by a large number of native subordinates, "Bulis," all under the eye of a very few European stipendiary magistrates. The employment of native labor is under strict regulations. The revenue is raised in conformity with native ideas, each district being assessed yearly to furnish certain supplies in kind, which are disposed of by tender. The white settlers at the end of 1876 numbered 1569.

The labors of the Wesleyan missionaries must always have a prominent place in any history of Fiji. They came from Tonga in 1835, and naturally settled first in the Windward Islands, where the Tongan element, already familiar to them, preponderated. They perhaps identified themselves too closely with their Tongan friends, whose dissolute, lawless, tyrannical conduct led to much mischief; but it should not be forgotten that their position was a difficult one; their services to humanity were certainly great, and it was mainly through their efforts that the heathen abominations so recently in full vigor have become a thing of the past.

FILANGIERI, CARLO (1783–1867), an Italian general, son of the economist Gaetano Filangieri, was born at Naples in 1783, not long before his father's death. In 1799 he came to France, and, through the influence of the first consul, was admitted to the prytanée, then the training school for young officers, where he remained for the usual period of two years. Entering the French army, he was promoted to the rank of captain on the field of Austerlitz. He afterwards connected himself with the Neapolitan army which he accompanied to Spain (1808), where he distinguished himself by a brilliant, though not always considerate, valor. He fought many duels, one with General Franceschi, whom he killed. In 1815 he was created general by Murat, and decorated with the order of the Deux-Siciles, after being severely wounded by the Austrians while reconnoitring on the Tanaro. On the restoration of the Bourbons to the throne of Naples, Filangieri opposed the constitution of 1820, and showed himself a most decided partisan of absolute power. He, however, incurred the displeasure of Ferdinand I.; but on the accession of Ferdinand II., he was placed at the head of the artillery and engineers. In 1848 he powerfully helped to check the revolutionary movement, by taking Messina after a terrible bombardment which lasted four days; and six months after, when the armistice imposed by England and France expired, he completed the submission of Sicily, of which he was appointed governor-general with dictatorial powers. As a reward for his services he received the title of duke of Taormina. He died in 1867.

FILANGIERI, GAETANO (1752–1788), an eminent Italian publicist, was born at Naples on the 18th of August, 1752. He was the third son of Cæsar prince of Arianiello, and through his mother he was connected with the ducal house of Fragnito. Gaetano was from his infancy destined for the profession of arms; when only seven years of age he received a military appointment, and at fourteen he began actual service. His early years gave no promise of future distinction; he seems originally to have manifested a positive dislike for the classics, while his interest in the exact sciences, it is said, was first awakened at a comparatively mature age by a trivial circumstance. His brother's tutor had made a mistake in the solution of a mathematical problem; Gaetano had been acute enough to discover and rectify the error. From that day his great intellectual powers began to develop rapidly, and such was his diligence that, at twenty years of age, besides being well grounded in mathematical science, he had acquired a competent knowledge of Latin and Greek, of ancient and modern history, as well as of the principles of law, and, moreover, had composed a couple of essays, one on "Educational Reform" and another on the "Morals of Princes." Meanwhile he had quitted the military service, and, yielding to the wishes of his friends rather than to his own inclinations, had entered on the profession of the law. At the bar his knowledge and eloquence soon secured his success, and special circumstances still further helped his advancement. In the year 1774 King Charles III. of Naples, at the instance of his minister Tanucci, had issued a much-needed ordinance for the reform of abuses in the administration of justice. Although this reform had been generally welcomed, it had excited the murmurs of the bar. Filangieri now became the advocate of the court, and published a defence of the royal decree founded upon the most enlarged views of law and equity. The extensive knowledge and matured judgment displayed in this performance called forth the warm commendation of Tanucci, who encouraged its author to pursue the course in which he had already acquired so much distinction. Through this influence and that of his uncle the archbishop of Palermo he received, in 1777, several honorable appointments at court; but his residence there neither broke in upon his regular habits of life, nor interrupted the course of his studies; nor did he allow it to interfere with the composition of the great work, *La Scienza della Legislazione*, on which he was engaged, and to which, rather than to practice at the bar, he had all along been devoting his chief attention. The first and second books, containing respectively an exposition of the rules on which legislation in general ought to proceed, and a discussion of political and economic laws in particular, appeared at Naples, 1780. Its success was great and immediate. Not only in Italy, but throughout Europe at large, the author forthwith took rank with the most celebrated publicists,—with his own countrymen Gravina, Vico, and Beccaria, and with the illustrious

Montesquieu. Although in the course of his observations he had found it necessary to point out many faults committed by his own Government, so skilfully had he discharged the delicate task of stating obnoxious truths without giving offence to those in power that he was promoted by the king to a commandery in the royal order of Constantine. In 1783 he was married to Caroline von Frendel, an Hungarian lady; and in order that he might the more fully enjoy domestic happiness, and at the same time have leisure for the composition of his work, on which he became every day more intent, he, with the consent of the king, resigned all his military appointments and his offices at court, and retired to a country seat at Cava, some twenty miles from Naples. In the same year he published the third book of his *Scienza*, relating entirely to the principles of criminal jurisprudence. Even his earlier volumes had not failed to rouse the antipathies of an interested and influential class; but in this certain suggestions which he had made as to the need for reform in the Roman Catholic Church called forth the censure of the ecclesiastical tribunals, and his book was condemned by the congregation of the Index in 1784. In the following year he nevertheless published three additional volumes, dealing with education and morals, these forming the fourth book of his great work. He was proceeding with the preparation of the remaining three books, but his health was now considerably impaired, owing to an excess of application, so that composition advanced but slowly; and other interruptions soon followed. In 1787 the new king, Ferdinand IV., summoned him to Naples to assist in the council of finance; and there for a time he was wholly engrossed with this important public business. But severe domestic misfortunes, combined with over-work, soon compelled his withdrawal from office once more. He had just finished the first part of his fifth book, in which he treats of the different systems of religion which preceded Christianity, when he died on the 21st of July, 1788. Of the second part of the same book he had only made a rude sketch, in which were noted down the principal subjects of discussion,—such as the advantages of Christianity, and the dangers of superstition; the inconveniences of not distinguishing the spiritual from the temporal power; the evils of an ignorant, venal, excessively wealthy clergy. He was then to have considered the principles of ecclesiastical jurisprudence; and a chapter on toleration was to have completed the book. In the sixth book he proposed to treat of the laws relating to property; and in the seventh and last, of those regarding the patria potestas and the government of families. It is much to be regretted that the author was not spared to complete his great work. Though unfinished, it has exercised considerable influence on the thought and feeling of Europe, particularly in Italy, where, at the time of its publication, the feudal system of legislation was still in full force. In some portions, particularly in the chapters on criminal law, it is not even now out of date. Filangieri had also other important works in contemplation when he died. One, of which he had written a short fragment, was to have been entitled *Nuova Scienza delle Scienze;* another was to have contained a system of universal history.

His great work, *La Scienza della Legislazione*, has gone through many editions, and has been translated into most of the languages of Europe. The best Italian edition is perhaps that of Livorno, in 5 vols. 8vo (1807). The Milan edition (1822) contains the *Opusculi scelti* and a life by Donato Tommasi. A French translation, by Gallois, appeared in Paris in 7 vols. 8vo (1786–98); it was republished in 1822–24, with the addition of the *Opuscules* and notes by Benjamin Constant. *The Science of Legislation* was translated into English by Sir R. Clayton (London, 1806).

FILBERT. See HAZEL.

FILE, a bar of steel having sharp teeth on its surface, and used for abrading or smoothing hard substances. Some uncivilized tribes polish their weapons with such things as rough stones, pieces of shark skin, or fishes' teeth. The operation of filing is recorded in 1 Sam. xiii. 21; and, among other facts, the similarity of the name for the filing instrument among various European peoples points to an early practice of the art. A file differs from a *rasp* (which is chiefly used for working wood, horn, and the like) in having its teeth cut with a chisel whose straight edge extends across its surface, while the teeth of the rasp are formed by solitary indentations of a pointed chisel. According to the form of their teeth, files may be *single-cut* or *double-cut;* the former have only one set of parallel ridges (either at right angles or at some other angle with the length); the latter (and more common) have a second set cut at an angle with the first. The double-cut file presents sharp angles to the filed surface, and is better suited for hard metals. Files are also classed according to fineness of teeth, being known (in order of increasing fineness) as *rough, bastard, second-cut, smooth,* and, *superfine* or *dead smooth.* The shapes of files present almost endless varieties. Common forms are—the *flat* file, of parallelogram section, with uniform breadth and thickness, or tapering, or "bellied;" the *four-square* file, of square section, sometimes with one side "safe," or left smooth; the so-called *three-square* file, having its cross section an equilateral triangle, the *half-round* file, a segment of a circle, the *round* or *rat-tail* file, a circle; these are generally tapered. The *float* file is like the *flat*, but single-cut. There are many others. Files vary in length from three-quarters of an inch (watchmakers') to two or three feet and upwards (engineers'). The length is reckoned exclusively of the spike or tang which enters the handle. Most files are tapered; the *blunt* are nearly parallel, with larger section near the middle; a few are parallel. The *rifflers* of sculptors and a few other files are curvilinear in their central line.

Cast-steel is the material chiefly used for files, though the larger and rougher varieties are sometimes made from blister-steel. In manufacture, the blanks are forged from bars that have been tilted or rolled as nearly as possible to the sections required. They are then annealed with great care, and when sufficiently softened are taken out, straightened, if necessary, with hand hammers, and then rendered clean and accurate in form by filing or grinding. They are now ready for cutting. In this process, as performed by hand, the cutter sits before a square stake or anvil, on which the blank, slightly greased, is held (having its tang towards him) by means of two leather straps passed round its ends, and held fast below, one by each foot. He holds in his left hand a short chisel (the edge of which always exceeds the width of the file), placing it on the blank with a slight inclination from him, and beginning near the further end. He strikes the chisel sharply with a hammer, an indentation is thus made, and the steel, slightly thrown up on the side next the tang, forms a ridge. The chisel is then transferred to the uncut surface, and slid from the operator till it reaches the ridge just made; thus the position of the next cut is determined; the chisel is again struck, and so on. (The end part of the file is dealt with separately.) The workman seeks to give his blows as uniformly as possible. Sixty to eighty cuts are made in one minute. After finishing the first *course* of cuts, he proceeds, if the file is to be double-cut, to make the second course, the cuts of the latter being generally somewhat finer. Thus the surface is covered with teeth inclined towards the point of the file. If the file is flat and is to be cut on the other side, it is turned over, and a thin plate of pewter placed below it to protect the teeth. Triangular and other files are supported in grooves in lead. In cutting round and half-round files, a straight chisel is applied as tangent to the curve. The round face of a half-round file requires eight, ten, or more courses to complete it.

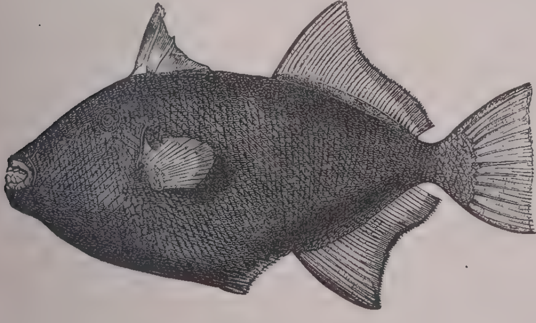
The file is next hardened. Being first covered with a paste to protect the teeth from the direct action of fire, etc. (*e.g.*, passed through beer-grounds to make it sticky, then through a mixture of common salt with roasted and pounded cow's hoof), it is heated to an even red heat, and then suddenly cooled by plunging in cold water or brine. It is removed before cooling throughout, that it may be straightened if necessary (which is done by pressure). Then it is cooled in oil. The tang is next submitted to a softening process, and the file, after being wiped, and the teeth brushed clean, is ready for fixing into the handle and for use.

In England files are chiefly made in Sheffield and Warrington, those of the latter place being generally known as Lancashire files. It is remarkable that while many other operations that appear more difficult than file-cutting are now effected by machinery, and while numerous file-cutting machines have been invented, the work continues (in England) to be largely done by hand. This is perhaps partly due to strong opposition on the part of operatives to introduction of machinery, and also to a foolish prejudice in favor of hand-cut files (machine-cut files, indeed, are not unfrequently sold as hand-cut), but probably also to the problem of cutting files by machinery being really somewhat difficult. In most of the machines invented for that purpose, the idea has been to construct an iron arm and hand to hold the chisel, and a hammer to strike the blow, and so to imitate, as closely as possible, the manual process. Bernot's machine is an improvement on this. In it the blow is given by pressure of a flat steel spring pressing on the top of a vertical slide, at the lower end of which the chisel is firmly fixed. The slide is acted on by a cam making about one thousand revolutions a minute, and the chisel consequently strikes that number of blows per minute. The vibration is thus lessened. The history of file-making by machinery in America (where it has been extensively practised) seems to indicate that much of the failure experienced has been due to the fatal defect in the machinery used, of producing extreme regularity in the teeth. This gives rise to complaints by artisans about files "running in grooves," "chattering," etc. The grooves produced by the file (if double-cut especially) at the beginning of its movement are deepened as it is moved further. With irregular teeth, on the other hand, such as are found in all hand-made files, the grooves made in the first instance have their sides cut away as the file is advanced. The Nicholson File Company, in Providence, Rhode Island, have used, with large and increasing success a machine which imitates, to some extent, this irregular result of the hand process, cutting the files so that no two spaces are found exactly alike in the entire length.

The filing of a flat surface perfectly true is the test of a good filer; and this is no easy matter to the beginner. The piece to be operated upon is generally fixed about the level of the elbow, the operator standing, and, except in the case of small files, grasping the file with both hands, the handle with the right, the further end with the left. The great point is to be able to move the file forward with pressure in horizontal straight lines; from the tendency of the hands to move in arcs of circles, the heel and point of the file are apt to be alternately raised. This is partially compensated by the bellied form given to many files (which also counteracts the frequent warping effect of the hardening process, by which one side of a flat file may be rendered concave and useless). In bringing back the file for the next thrust it is nearly lifted off the work. Further, much delicacy and skill are required in adapting the pressure and velocity, ascertaining if foreign matters or filings remain interposed between the file and the work, etc. Files can be cleaned with a piece of the so-called *cotton-card* (used in combing cotton wool) nailed to a piece of wood. In *draw-filing*, which is sometimes resorted to to give a neat finish, the file is drawn sideways to and fro over the work. New files are generally used for a time on brass or cast-iron, and when partially worn they are still available for filing wrought iron and steel.

An interesting application of the sandblast to sharpening the teeth of files has recently been made by Mr. Tilghman. (A. B. M.)

FILE-FISH and **Trigger-fish** are names given to fishes of the genus *Balistes* (and *Monacanthus*) inhabiting all tropical and subtropical seas. Their body is compressed and not covered with ordinary scales, but with small juxtaposed scutes. Their other principal characteristics consist in the structure of their first dorsal fin (which consists of three spines) and in their peculiar dentition. The first of the three dorsal spines is very strong, roughened in front like a file, and hollowed out behind to receive the second much smaller spine, which, besides, has a projection in front, at its base, fitting into a notch of the first. Thus these two spines can only be raised or depressed simultaneously, in such a manner that the first cannot be forced down unless the second has been previously depressed. The latter has been compared to a trigger, hence the name of *Trigger-fish*. Also the generic name *Balistes* and the Italian name of "Pesce balistra" refer to this structure. Both jaws are armed with eight strong incisor-like and sometimes pointed teeth, by which these fishes are enabled, not only to break off pieces of madrepores and other corals on which they feed, but also to chisel a hole into the hard shells of Mollusca, in order to extract the soft parts. In this way they destroy an immense number of mollusks, and become most injurious to the pearl-fisheries. The gradual failure of those fisheries in Ceylon has been ascribed to this cause, although evidently other agencies must have been at work at the same time. The *Monacanthi* are distinguished from the *Balistes* in having only one dorsal spine and a velvety covering of the skin. Some 30 different species are known of *Balistes*, and about 50 of *Monacanthus*. Two species (*B. maculatus* and *capriscus*), common in the Atlantic, sometimes wander to the British coasts.



Balistes vidua.

FILELFO, Francesco (1398–1481), was born in 1398 at Tolentino, in the March of Ancona. When he appeared upon the scene of human life, Petrarch and the students of Florence had already brought the first act in the recovery of classic culture to conclusion. They had created an eager appetite for the antique, had disinterred many important Roman authors, and had freed Latin scholarship to some extent from the barbarism of the Middle Ages. Filelfo was destined to carry on their work in the field of Latin literature, and to be an important agent in the still unaccomplished recovery of Greek culture. His earliest studies in grammer, rhetoric, and the Latin language were conducted at Padua, where he acquired so great a reputation for learning that in 1417 he was invited to teach eloquence and moral philosophy at Venice. According to the custom of that age in Italy, it now became his duty to explain the language, and to illustrate the beauties of the principal Latin authors, Cicero and Virgil being considered the chief masters of moral science and of elegant diction. Filelfo made his mark at once in Venice. He was admitted to the society of the first scholars and the most eminent nobles of that city; and in 1419 he received an appointment from the state, which enabled him to reside as secretary to the consul-general of the Venetians in Constantinople. This appointment was not only honorable to Filelfo as a man of trust and general ability, but it also gave him the opportunity of acquiring the most coveted of all possessions at that moment for a scholar—a knowledge of the Greek language. Immediately after his arrival in Constantinople, Filelfo placed himself under the tuition of John Chrysoloras, whose name was already well known in Italy as brother of Manuel, the first Greek to profess the literature of his ancestors in Florence. At the recommendation of Chrysoloras he was employed in several diplomatic missions by the emperor John Palæologus. Before very long the friendship between Filelfo and his tutor was cemented by the marriage of the former to Theodora, the daughter of John Chrysoloras. He had now acquired a thorough knowledge of the Greek language, and had formed a large collection of Greek manuscripts. There was no reason why he should not return to his native country. Accordingly, in 1427 he accepted an invitation from the republic of Venice, and set sail for Italy, intending to resume his professorial career. From this time forward until the date of his death, Filelfo's history consists of a record of the various towns in which he lectured, the masters whom he served, the books he wrote, the authors he illustrated, the friendships he contracted, and the wars he waged with rival scholars. He was a man of vast physical energy, of inexhaustible mental activity, of quick passions, and violent appetites; vain, restless, greedy of gold and pleasure and fame; unable to stay quiet in one place, and perpetually engaged in quarrels with his compeers.

When Filelfo arrived at Venice with his family in 1427, he found that the city had almost been emptied by the plague, and that his scholars would be few. He therefore removed to Bologna; but here also he was met with drawbacks. The city was too much disturbed with political dissensions to attend to him; so Filelfo crossed the Apennines and settled in Florence. At Florence began one of the most brilliant and eventful periods of his life. During the week he lectured to large audiences of young and old on the principal Greek and Latin authors, and on Sundays he explained Dante to the people in the Duomo. In addition to these labors of the chair, he found time to translate portions of Aristotle, Plutarch, Xenophon, and Lysias from the Greek. Nor was he dead to the claims of society. At first he seems to have lived with the Florentine scholars on tolerably good terms; but his temper was so arrogant that Cosimo de' Medici's friends were not long able to put up with him. Filelfo hereupon broke out into open and violent animosity; and when Cosimo was exiled by the Albizzi party in 1433, he urged the signoria of Florence to pronounce upon him the sentence of death. On the return of Cosimo to Florence, Filelfo's position in that city was no longer tenable. His life, he asserted, had been already once attempted by a cut-throat in the pay of the Medici; and now he readily accepted an invitation from the state of Siena. In Siena, however, he was not destined to remain more than four years. His fame as a professor had grown great in Italy, and he daily received tempting offers from princes and republics. The most alluring of these, made him by the duke of Milan, Filippo Maria Visconti, he decided on accepting; and in 1440 he was received with honor by his new master in the capital of Lombardy.

Filelfo's life at Milan curiously illustrates the multifarious importance of the scholars of that age in Italy. It was his duty to celebrate his princely patrons in panegyrics and epics, to abuse their enemies in libels and invectives, to salute them with encomiastic odes on their birthdays, and to compose poems on their favorite themes. For their courtiers he wrote epithalamial and funeral orations; ambassadors and visitors from foreign states he greeted with the rhetorical lucubrations then so much in vogue. The students of the university he taught in daily lectures, passing in review the weightiest and lightest authors of antiquity, and pouring forth a flood of miscellaneous erudition. Not satisfied with these outlets for his mental energy, Filelfo went on translating from the Greek, and prosecuted a paper warfare with his enemies in Florence. He wrote, moreover, political pamphlets on the great events of Italian history; and when Constantinople was taken by the Turks, he procured the liberation of his wife's mother by a message addressed in his own name to the sultan. In addition to a fixed stipend of some 700 golden florins yearly, he was continually in receipt of special payments for the orations and poems he produced; so that, had he been a man of frugal habits or of moderate economy, he might have amassed a considerable fortune. As it was, he spent his money as fast as he received it, living in a style of splendor ill befitting a simple scholar, and indulging his taste for pleasure in more than questionable amusements. In consequence of this prodigality, he was always poor. His letters and his poems abound in impudent demands for money from patrons, some of them couched in language of the lowest adulation, and others savoring of literary brigandage.

During the second year of his Milanese residence Filelfo lost his first wife, Theodora. He soon married again; and this time he chose for his bride a young lady of good Lombard family, called Orsina Osnaga. When she died, he took in wedlock for the third time a woman of Lombard birth, Laura Magiolini. To all his three wives, in spite of numerous infidelities, he seems to have been warmly attached; and this is perhaps the best trait in a character otherwise more remarkable for arrogance and heat than for any amiable qualities.

On the death of Filippo Maria Visconti, Filelfo, after a short hesitation, transferred his allegiance to Francesco Sforza, the new duke of Milan; and in order to curry favor with this parvenu, he began his ponderous epic, the *Sforziad*, of which 12,800 lines were written, but which was never published. When Francesco Sforza died, Filelfo turned his thoughts towards Rome. He was now an old man of seventy-seven years, honored with the friendship of princes, recognized as the most distinguished of Italian humanists, courted by pontiffs, and decorated with the laurel wreath and the order of knighthood by kings. Crossing the Apennines and passing through Florence, he reached Rome in the second week of 1475. The terrible Sixtus IV. now ruled in the Vatican; and from this pope Filelfo had received an invitation to occupy the chair of rhetoric with good emoluments. At first he was vastly pleased with the city and court of Rome; but his satisfaction ere long turned to discontent, and he gave vent to his ill humor in a venomous satire on the pope's treasurer, Milliardo Cicala. Sixtus himself soon fell under the ban of his displeasure; and when a year had passed, he left Rome never to return. Filelfo reached Milan to find that his wife had died of the plague in his absence, and was already buried. His own death followed speedily. For some time past he had been desirous of displaying his abilities and adding to his fame in Florence. Years had healed the breach between him and the Medicean family; and on the occasion of the Pazzi conspiracy against the life of Lorenzo de' Medici, he had sent violent letters of abuse to his papal patron Sixtus, denouncing his participation in a plot so dangerous to the security of Italy. Lorenzo now invited him to profess Greek at Florence, and thither Filelfo journeyed in 1481. But two weeks after his arrival he succumbed to dysentery, and was buried at the age of eighty-three in the church of the Annunziata.

Filelfo deserves commemoration among the greatest humanists of the Italian Renaissance, not for the beauty of his style, not for the elevation of his genius, not for the accuracy of his learning, but for his energy, and for his complete adaptation to the times in which he lived. His erudition was large but ill-digested; his knowledge of the ancient authors, if extensive, was superficial; his style was vulgar; he had no brilliancy of imagination, no pungency of epigram, no grandeur of rhetoric. Therefore he has left nothing to posterity which the world would not very willingly let die. But in his own days he did excellent service to learning by his untiring activity, and by the facility with which he used his stores of knowledge. It was an age of accumulation and preparation, when the world was still amassing and cataloguing the fragments rescued from the wrecks of Greece and Rome. Men had to receive the very rudiments of culture before they could appreciate its niceties. And in this work of collection and instruction Filelfo excelled, passing rapidly from place to place, stirring up the zeal for learning by the passion of his own enthusiastic temperament, and acting as a pioneer for men like Poliziano and Erasmus. All that is worth knowing about Filelfo is contained in Rosmini's admirable *Vita di Filelfo*, Milan, 1808; but the student may also consult Roscoe's *Life of Lorenzo de' Medici*, Vespasiano's *Vite di Uomini Illustri*, and Burckhardt's *Italian Renaissance*, with profit. (J. A. S.)

FILIBUSTER, a name first given to the buccaneers, a band of piratical adventurers who maintained themselves chiefly in the Caribbean seas during the 17th century (see BUCCANEER). The origin of the term has been explained in two ways,—some deriving it from the English word *flyboat*, French *flibot*, Spanish *flibote*, a name given to a small vessel not exceeding 100 tons, which, on account of its sailing qualities, was much used by pirates, while others make it synonymous with the Dutch *vry buiter*, German *freibeuter*, English *freebooter*, the word changing first into *fribustier*, and then into French *flibustier*, Spanish *filibustero*. *Flibustier* has passed into the French language and *filibustero* into the Spanish language as a general name for a pirate, and the term *filibuster* was revived in America to designate those adventurers who, after the termination of the war between Mexico and the United States, organized expeditions within the United States against the Spanish West Indies.

FILICAIA, VINCENZO DA (1642–1707), sprung from an ancient and noble family of Florence, was born in that city December 30, 1642. From an incidental notice in one of his letters, stating the amount of house rent paid during his childhood, his parents must have been in easy circumstances, and the supposition is confirmed by the fact that he enjoyed all the advantages of a liberal education, first under the Jesuits of Florence, and then in the university of Pisa. At Pisa his mind became stored, not only with the results of patient study in various branches of letters, but with the great historical associations linked with the former glory of the Pisan republic, and with one remarkable institution of which Pisa was the seat. To the tourist who now visits

Pisa the banners and emblems of the order of St. Stephen are mere matter of curiosity, but they had a serious significance two hundred years ago to the young Tuscan, who knew that these naval crusaders formed the main defence of his country and commerce against the Turkish, Algerine, and Tunisian corsairs. After a five years' residence in Pisa he returned to Florence, where he married Anna, daughter of the senator and marquis Scipione Capponi, and withdrew to a small villa at Figline, not far from the city. Abjuring the thought of writing amatory poetry in consequence of the premature death of a young lady to whom he had been attached, he occupied himself chiefly with literary pursuits, above all the composition of Italian and Latin poetry. His own literary eminence, the opportunities enjoyed by him as a member of the celebrated Academy Della Crusca for making known his critical taste and classical knowledge, and the social relations within the reach of a noble Florentine so closely allied with the great house of Capponi, sufficiently explain the intimate terms on which he stood with such eminent men of letters as Magalotti, Menzini, Gori, and Redi. The last-named, the author of *Bacchus in Tuscany*, was not only one of the most brilliant poets of his time, and a safe literary adviser; he was the court physician, and his court influence was employed with zeal and effect in his friend's favor. Filicaia's rural seclusion was owing even more to his straitened means than to his rural tastes. If he ceased at length to pine in obscurity, the change was owing not merely to the fact that his poetical genius, fired by the deliverance of Vienna from the Turks in 1683, poured forth the right strains at the right time, but also to the influence of Redi, who not only laid Filicaia's verses before his own sovereign, but had them transmitted with the least possible delay to the foreign princes whose noble deeds they sung. The first recompense came, however, not from those princes, but from Christina, the ex-queen of Sweden, who, from her circle of savans and courtiers at Rome, spontaneously and generously announced to Filicaia her wish to bear the expense of educating his two sons, enhancing her kindness by the delicate request that it should remain a secret. And now the tide of Filicaia's fortunes turned. The grand-duke of Tuscany, Cosmo III., conferred on him an important office, the commissionership of official balloting. He was named governor of Volterra in 1696, where he strenuously exerted himself to raise the tone of public morality. Both there and at Pisa, where he was subsequently governor in 1700, his popularity was so great that on his removal the inhabitants of both cities petitioned for his recall. He passed the close of his life at Florence; the grand-duke raised him to the rank of senator, and he died in that city on the 24th of September, 1707. He was buried in the family vault in the church of St. Peter, and a monument was erected to his memory by his sole surviving son Scipione Filicaia. In the six celebrated odes inspired by the great victory of Sobieski, Filicaia took a lyrical flight which has placed him at moments on a level with the greatest Italian poets. They are, however, unequal, like all his poetry, reflecting in some passages the native vigor of his genius and purest inspirations of his tastes, whilst in others they are deformed by the affectations of the *Seicentisti*. When thoroughly natural and spontaneous,—as in the two sonnets "Italia, Italia, o tu cui feo la sorte" and "Dov' è, Italia, il tuo braccio? e a che ti serve;" in the verses "Alla beata Vergine," "Al divino amore;" in the sonnet "Sulla fede nelle disgrazie"—the truth and beauty of thought and language recall the verse of Petrarch. Besides the poems published in the complete Venice edition of 1762, several other pieces appeared for the first time in the small Florence edition brought out by Barbera in 1864.

FILIGREE, formerly written filigrain or filigrane (the Italian *filigrana*, Fr. *filigrane*, Span. *filigrana*, Germ. *Drahtgeflecht*), jewel work of a delicate kind made with threads and beads usually of gold and silver. The compound word from the Latin *filum*, thread, and *granum*, grain, is not found in Ducange, and is indeed of modern origin. Though filigree has become a special branch of jewel work in modern times it was anciently part of the ordinary work of the jeweller. Signor Castellani states, in his lecture on "Antique Jewelry," that all the jewelry of the Etruscans and Greeks was made by soldering together wires and grains or minute plates of gold rather than by hammering or stamping the precious metals in dies.

The art may be said to consist in curling, twisting, and plaiting fine pliable threads of metal, and uniting them at their points of contact with gold or silver, solder and borax, by the help of the blow-pipe. Small grains or beads of the same metals are often set in the eyes of volutes, on the junctions, or at intervals at which they will set off the wire work effectively. The more delicate work is generally protected by framework of stouter wire. Brooches, crosses, earrings, and other personal ornaments of modern filigree are generally surrounded and subdivided by bands of square or flat metal, giving consistency to the filling up, which would not otherwise keep its proper shape.

Probably the oldest existing jewel work is that which has been found by Belzoni, Wilkinson, Mariette, and other Egyptian discoverers in the tombs of Thebes and other places. Filigree forms an important feature of the ornamentation. Amongst the jewelry now in the British Museum, and in the Louvre in Paris, are examples of the round plaited gold chains of fine wire, such as are still made by the filigree workers of India, and known as Trichinopoly chains. From some of these are hung smaller chains of finer wire with minute fishes and other pendants fastened to them. Most of the rings found in these collections are whipped with gold wire soldered to the hoop. The Greek and Etruscan filigree of about 3000 years ago is of extraordinary fineness and very perfect execution. A number of earrings and other personal ornaments found in Central Italy are preserved in the Campana collection of the Louvre and amongst the gems of the British Museum. Almost all of them are made of filigree work. Some earrings are in the form of flowers of geometric design, bordered by one or more rims each made up of minute volutes of gold wire, and this kind of ornament is varied by slight differences in the way of disposing the number or arrangement of the volutes. But the feathers and petals of modern Italian filigree are not seen in these ancient designs. In many earrings chains hang from the upper part, and tiny birds, such as doves or peacocks covered with enamel, are set amongst these hanging ornaments. Other Etruscan earrings are short tubes of gold, half or three-quarters of an inch long by half an inch or less in diameter, with a plate of gold attached to the side, and the whole surface covered with filigree soldered on in minute patterns. Many rings resemble fishes with the tails in their mouths, made up of thin plates of gold and wire work of the same metal. A beautiful collection of antique examples of Greek jewelry found in the Chersonese and along the coast of Asia Minor was placed, before the Crimean war, in a museum at Kertch. Many bracelets and necklaces in that collection are made of twisted wire, some in as many as seven rows of plaiting, with clasps in the shape of heads of animals of beaten work. Others are strings of large beads of gold, with grains of gold, or with volutes and knots of wire soldered over the surfaces. (See the *Bosphore Cimmerien*, in which will be found careful engravings of these objects.) In the British Museum a sceptre, probably that of a Greek priestess, is covered with plaited and netted gold wire, finished with a sort of Corinthian capital and a boss of green glass.

It is probable that in India and various parts of central Asia filigree has been worked from the most remote period without any change in the designs. Whether the Asiatic jewellers were influenced by the Greeks settled on that continent, or merely trained under traditions held in common with them, it is certain that the Indian filigree workers retain the same patterns as those of the ancient Greeks, and work them in the same way, down to the present day. Wandering workmen are given so much gold, coined or rough, which is weighed, heated in a pan of charcoal, beaten into wire, and then worked in the courtyard or veranda of the employer's house according to the designs of the artist, who weighs the complete work on restoring it and is paid at a specified rate for his labor. Very fine grains or beads and spines of gold, scarcely thicker than coarse hair, projecting from plates of gold are methods of ornamentation still used. This work requires the utmost delicacy of hand to execute, and is of extraordinary richness of effect. Signor Castellani, the modern Cellini of Italy, who has made the antique filigree work of the Etruscans and Greeks his special study, found it for a long time impossible to revive this particular process of delicate soldering; but the difficulty has been overcome at last.

Passing to later times we may notice in many collections of mediæval jewel work (such as that in the South Kensington Museum) reliquaries, covers for the gospels, etc., made either in Constantinople from the 6th to the 12th centuries, or in monasteries in Europe, in which Byzantine goldsmiths' work was studied and imitated. These objects, besides being enriched with precious stones, polished, but not cut into facets, and with enamel, are often decorated with filigree. Large surfaces of gold are sometimes covered with scrolls of filigree soldered on; and corner pieces of the borders of book covers, or the panels of reliquaries, are not unfrequently made up of complicated pieces of plaited work alternating with spaces encrusted with enamel. Byzantine filigree work occasionally has small stones set amongst the curves or knots. Examples of such decoration can be seen in the South Kensington and British Museums.

In the north of Europe the Saxons, Britons, and Celts were from an early period skilful in several kinds of goldsmiths' work. As early as the middle of the 5th century the brooches and other personal ornaments of the "Littus Saxonicum" in England were encrusted with enamel, often set in bands of pure gold, and the enamel work varied with borders or centres of filigree.

The Irish filigree work is more thoughtful in design and more varied in pattern than that of any period or country that could be named. It reached its highest perfection, according to Dr. Petrie, in the 10th and 11th centuries. The Royal Irish Academy in Dublin contains a number of reliquaries and personal jewels, of which filigree is the general and most remarkable ornament. The "Tara" brooch has been copied and imitated, and the shape and decoration of it are well known. Instead of fine curls or volutes of gold thread, the Irish filigree is varied by numerous designs in which one thread can be traced through curious knots and complications, which, disposed over large surfaces, balance one another, but always with special varieties and arrangements difficult to trace with the eye. The long thread appears and disappears without breach of continuity, the two ends generally worked into the head and the tail of a serpent or a monster. The reliquary containing the "Bell of St. Patrick" is covered with knotted work in many varieties. A two-handled chalice, called the "Ardagh cup," found near Limerick a few years since, has belts, bosses at the junctions of the handles, and the whole lining of the foot ornamented with work of this kind of extraordinary fineness. The late Lord Dunraven (*Royal Irish Academy Trans.*, vol. xxiv.) numbers forty varieties of pattern on this cup alone. Some are the Greek fret with Celtic varieties, spiral trumpet-shaped lines, interlaced bands, knots, and arabesques, all in several varieties.

Much of the mediæval jewel work all over Europe down to the 15th century, on reliquaries, crosses, croziers, and other ecclesiastical goldsmiths' work, is set off with bosses and borders of filigree. Filigree work in silver was practised by the Moors of Spain during the Middle Ages with great skill, and was introduced by them and established all over the Peninsula, where silver filigree jewelry of delicate and artistic design is still made in considerable quantities. The manufacture spread over the Balearic Islands, and among the populations that border the Mediterranean. It is still made all over Italy, and in Albania, the Ionian Islands, and many other parts of Greece. That of the Greeks is sometimes on a large scale, with several thicknesses of wires alternating with larger and smaller bosses and beads, sometimes set with turquoises, etc., and mounted on convex plates, making rich ornamental headpieces, belts, and breast ornaments. Filigree silver buttons of wire work and small bosses are worn by the peasants in most of the countries that produce this kind of jewelry. Silver filigree brooches and buttons are also made in Denmark, Norway, and Sweden. Little chains and pendants are added to much of this northern work. Beautiful specimens have been contributed to the various international exhibitions.

Some very curious filigree work was brought from Abyssinia after the capture of Magdala—arm guards, slippers, cups, etc., some of which are now in the South Kensington Museum. They are made of thin plates of silver, over which the wire work is soldered. The filigree is subdivided by narrow borders of simple pattern, and the intervening spaces are made up of many patterns, some with grains set at intervals.

Great interest has been felt in the revival of the designs of antique jewelry by Signor Castellani. He collected examples of the peasant jewelry still made in many provinces of Italy on traditionary designs preserved from a remote antiquity. Most of the decoration is in filigree of many varieties. It was in part through the help of workmen in remote villages, who retained the use of various kinds of solders, long forgotten elsewhere, that the fine reproductions of antique gold filigree have been so beautifully carried into execution in Italy, and by Italian jewellers in London.

For examples of antique work the student should examine the jewel room of the British Museum, the Campana collection in the Louvre in Paris, and the collection in the South Kensington Museum. The last contains a large and very varied assortment of modern Italian, Spanish, Greek, and other jewelry made for the peasants of various countries. The Celtic work is well represented in the Royal Irish Academy in Dublin. (J. H. P.)

FILIPPINO. See Lippi.

FILLAN, St. The accounts given by various writers of this saint, in so far as they supply any details, are, as in many similar cases, purely legendary and conjectural. That such an ecclesiastic existed, that he was of Irish origin, and that he was venerated in Glendochart and Strathfillan in Perthshire as early as the 8th or 9th century, may be held as certain. There was an ancient monastery in that district dedicated to St. Fillan, which, like most of the religious houses of early times, was afterwards secularized. The lay-abbot, who was its superior in the reign of William the Lion, held high rank in the Scottish kingdom. This monastery was restored in the reign of Robert Bruce, and became a cell of the abbey of canons-regular at Inchaffray. The new foundation received a grant from King Robert, in gratitude for the aid which he was supposed to have obtained from a relic of the saint on the eve of the great victory of Bannockburn. Another relic was the saint's staff or crozier, which became known as the coygerach or quigrich, and was long in the possession of a family of the name of Jore or Dewar, who were its hereditary guardians. They certainly had it in their custody in the year 1428, and their right was formally recognized by King James III. in 1487. The head of the crozier, which is of silver-gilt with a smaller crozier of bronze inclosed within it, is now deposited in the National Museum of the Society of Antiquaries of Scotland. It was secured for them through the exertions of Dr. Daniel Wilson, author of the *Prehistoric Annals of Scotland.* This crozier has attracted much attention among Scottish antiquaries, and its history has been minutely investigated.

On the subject of this article reference may be made to Cosmo Innes's *Sketches of Early Scottish History*, pp. 389–394, 623–624; Bishop Forbes's *Kalendars of Scottish Saints*, pp. 341–346; and specially to the *Historical Notices of St. Fillan's Crozier*, by the late eminent antiquary Dr. John Stuart, who died while this, his latest work, was passing through the press.

FILLMORE, Millard (1800–1874), thirteenth president of the United States of America. His family was of English stock, and had early settled in New England. His father, Nathaniel Fillmore, made in 1795 a clearing within the limits of what is now the town of Summer Hill, Cayuga co., New York, and there the future president was born, January 7, 1800. The father went by the title of "the squire," and served as a justice in the beginnings of the settlements nearest to him, which were very sparsely occupied. Millard, to the age of fourteen, could have shared only the simplest rudiments of education, chiefly from his parents, with slight help from a school. At that age he was apprenticed, for the usual term, to a fuller and clothier, to card wool, and to dye and dress the cloth from the farmers' houses. Two years before the close of his term, he, by a promissory note for thirty dollars, bought the remainder of his time from his master, and entered a retired lawyer's office as a student and helper at the age of nineteen. He, of course, received and accepted the usual honor extended to young men of his proclivities, to deliver the Fourth of July Oration, before he was twenty-one years of age. In 1820 he made his way to Buffalo,—then only the germ of the present flourishing city,—and supported himself as a student in another law office by teaching a school and aiding the postmaster. In 1823 he was admitted an attorney in the court of common pleas, Erie co., and then took up legal practice at Aurora, to which his father had removed. Hard study, temperance, and integrity gave him a good reputation and moderate success, and he was made an attorney and counsellor of the supreme court of the State. In 1826 he married Abigail, daughter of the Rev. Lemuel Powers. Returning to Buffalo in 1830 he formed a partnership with two lawyers, both afterwards distinguished in public life, and became successful at the bar. From 1828 to 1831 he served as a representative in the State legislature, coming in as an anti-mason. In the single term of 1832–4 he was a representative of his district in the national Congress, as anti-Jackson, or in opposition to the administration. From 1836 to 1842, when he declined further service, he represented his district as a member of the Whig party. In Congress he opposed the annexation of Texas as slave territory, was a warm advocate of internal improvements and a protective tariff, supported J. Q. Adams in maintaining the right of offering anti-slavery petitions, advocated the prohibition by Congress of the slave trade between the States, and favored the exclusion of slavery from the District of Columbia. His speech and tone, however, were moderate on these exciting subjects, and he claimed the right to stand free of pledges, and to adjust his opinions and his course by the development of circumstances. The Whigs having the ascendency in Congress during the latter part of his membership, he was made chairman of the House Committee of Ways and Means. Against a strong opposition he carried an appropriation of 30,000 dollars for Morse's telegraph, and secured important provisions in the new tariff measures of 1842. He found some supporters of his proposed nomination as a candidate for vice-president in the Whig National Convention at Baltimore. In May, 1844, being the Whig candidate for the governorship of New York, he was defeated by Silas Wright. In 1847 he was made comptroller of the State of New York, an office of manifold responsibilities and duties, which he resigned on his election, in November, 1848, as vice-president of the United States, Zachary Taylor being president. He presided over the senate ably and impartially during the seven months of exciting debate and agitation on the so-called "Compromise Measures," and Mr. Clay's "Omnibus Bill," which, though finally defeated as a whole, substantially succeeded in its general bearing on several matters of intense import to the nation as connected with the subject of slavery.

President Taylor died July 9, 1850, and the next day Fillmore, according to the special provision of the constitution, took the oath and acceded to the highest office, being then fifty-one years old. The cabinet which he called around him contained many distinguished men, as Webster, Corwin, Crittenden, Graham, Hall, and Kennedy. On the death of Webster in 1852, Edward Everett succeeded him as secretary of state. The president sent a force to protect New Mexico in the dispute as to its boundaries with Texas. The critical matter which gave its historic significance to his administration was that chief one of the class of "compromise" measures, the enactment of the Fugitive Slave Law, to make effective a provision of the constitution for the rendition of "fugitives from labor or service." Being instructed by Crittenden, his attorney-general, that the bill was not inconsistent with the constitutional sanction of the Habeas Corpus, the president signed the bill, and issued a proclamation calling upon Government officials to enforce it. These measures roused the most passionate opposition and animosity, among Whigs as well as anti-slavery men. The attempt to enforce the odious law was restricted by mobs in various free States, and was made, for the most part, wholly ineffectual, the people being resolved to regard it as annulled by the "higher law." The fact that the president had signed and sought to enforce the law, though he might plead for himself constitutional obligation, and a purpose of patriotic fidelity in the exercise of his best judgment, made a breach between him and his party. But few questioned the sincerity and purity of his intentions, or his own full persuasion that the measures were of vital necessity to pacify the nation. Still, as the result was a sharp and embittered variance among his previous supporters, his administration was regarded as inglorious, if not as a failure. In many other matters of high public concern, his official course, as indicated by his appointments, the recommendations in his messages, and the projects which he devised, was characterized by sound discretion, by humane promptings, and practical wisdom. His advice, however, even on these matters, was not always followed by Congress. That body having approved a plan for the extension of the Capitol, the president, on July 4, 1851, laid the cornerstone of the new edifice, Daniel Webster being the orator of the occasion. In the same year he interposed promptly and effectively in thwarting the projects of the "filibusters," under Lopez, for the invasion of Cuba. Commodore Perry's expedition to Japan, that of Lieutenant Lynch to Africa, and that of Ringgold to the Chinese Seas, with the exploration of the valley of the Amazon by Herndon and Gibbon, may be referred to as engaging the executive ability and wide forethought of the president. His term closed March 4, 1853. In the preceding autumn he had been an unsuccessful candidate for nomination for the presidency by the Whig National Convention, and he yielded his place to Franklin Pierce. Three weeks before the close of his term his wife died in Washington, and he quietly returned, with a son and a daughter, to private life in Buffalo. In 1854, he travelled extensively through the southern and western States, and in 1855–6 he visited Europe, moving from place to place in a quiet and unostentatious way, but receiving much courteous attention. He declined the proffered honor of D.C.L. from Oxford. While in Rome he was informed of his nomination for the presidency by the "Native American" party, the nominees of the other parties being Buchanan and Fremont. In 1858 he married Mrs. Caroline M'Intosh of Albany, a lady of fortune and culture. Retiring to his home in Buffalo, he enjoyed a studious retirement among his books and friends, taking no public share in political affairs. He took great interest in the Buffalo Historical Society, of which he was the president. His life closed March 8, 1874, in his seventy-fifth year. All who knew him in any relation accorded in regarding him as an upright and conscientious man, blameless, loving simple ways, and heartily devoted to the best interests of his country. (G. E. E.)

FILM. See CAPILLARY ACTION and OPTICS.

FILMER, SIR ROBERT, a writer of the 17th century, remarkable for his singular political theory, which deserves notice on account of the great attention which it excited, was the son of Sir Edward Filmer of East Sutton in Kent. He studied at Trinity College, Cambridge, where he matriculated in 1604. His death has been fixed at widely different dates, but of these the most probable is 1653. Filmer was already a middle-aged man when the great controversy between the king and the Commons roused him into literary activity. His writings afford an exceedingly curious example of the doctrines held by the most extreme section of the Divine Right party. Filmer's theory is founded upon the statement that the government of a family by the father is the true original and model of all government. In the beginning of the world God gave authority to Adam, who had complete control over his descendants, even as to life and death. From Adam this authority was inherited by Noah; and Filmer quotes as not unlikely the tradition that Noah sailed up the Mediterranean and allotted the three continents of the Old World to the rule of his three sons. From Shem, Ham, and Japheth the patriarchs inherited the absolute power which they exercised over their families and servants; and from the patriarchs all kings and governors (whether a single monarch or a governing assembly) derive their authority, which is therefore absolute, and founded upon divine right. The difficulty that a man "by the secret will of God may unjustly" attain to power which he has not inherited appeared to Filmer in no way to alter the nature of the power so obtained, for "there is, and always shall be continued to the end of the world, a natural right of a supreme father over every multitude." The king is perfectly free from all human control. He cannot be bound by the acts of his predecessors, for which he is not responsible; nor by his own, for "impossible it is in nature that a man should give a law unto himself"—a law must be imposed by another than the person bound by it. With regard to the English constitution, he asserted, in his *Freeholder's Grand Inquest touching our Sovereign Lord, the King and his Parliament* (1648), that the Lords only give counsel to the king, the Commons only "perform and consent to the ordinances of parliament," and the king alone is the maker of laws, which proceed purely from his will. It is monstrous that the people should judge or depose their king, for they would then be judges in their own cause. The most complete expression of Filmer's opinions is given in the *Patriarcha*, which was published in 1680, many years after his death. His position, however, was sufficiently indicated by the works which he published during his lifetime:—the *Anarchy of a Limited and Mixed Monarchy* (1646), an attack upon a treatise on monarchy by Nicholas Hutton, which maintained that the king's prerogative is not superior to the authority of the houses of parliament; the pamphlet entitled *The Power of Kings, and in particular of the King of England* (1648); and his *Observations upon Mr. Hobbes's Leviathan, Mr. Milton against Salmasius, and H. Grotius De Jure Belli et Pacis, concerning the Originall of Government* (1652). Filmer's theory, owing to the circumstances of the time, obtained a recognition which it is now difficult to understand. Nine years after the publication of the *Patriarcha*, at the time of the Revolution which banished the Stuarts from the throne, Locke singled out Filmer as the most remarkable of the advocates of Divine Right, and thought it worth while to attack him expressly in the first part of the *Treatise on Government*, going into all his arguments *seriatim*, and especially pointing out that even if the first steps of his argument be granted, the rights of the eldest born have been so often set aside that modern kings can claim no such inheritance of authority as he asserted.

FILTER, an arrangement for the separation of impurities from liquids, by passage through porous material. The filtering process is common in nature. The clearness of spring water is due to it; for such water generally comes from a considerable depth in the ground (as appears, *e.g.*, from its equable temperature throughout the year); and having traversed a variety of porous strata, it has undergone a straining action, producing the beautiful transparency we observe. This does not, of course, represent absolute purity, for the liquid retains in solution various substances acquired by contact with the strata through which it has percolated. The operation of filtration is extensively practised in purification of water, on a large scale for supply of towns and cities (now an important branch of civil engineering), and on a small scale for domestic purposes, and for the use of ships on a long voyage, etc. It is also a valued method in chemistry and the arts.

The mechanical action of straining, by which all particles larger than the interstices of the porous material are arrested, is one important function of filters, and it used to be commonly represented as their only function. They may act, however, in other ways to purify water. Not to speak of the further mechanical actions of subsidence on upper surfaces of particles of the filtering medium, and lateral attraction and adhesion of suspended matter (which doubtless occur in some measure), it is an important fact, now well ascertained, that a filter may separate from water a portion of the matter held in solution. On the other hand, it is often precisely such matter, when of organic origin and putrescent (and minute invisible disease-germs may here be included with the matter in solution), that it is specially desirable to remove from drinking water as being prolific of mischief when taken into the system. In numerous instances an outbreak of virulent disease, such as typhoid fever, has been clearly traced to water so contaminated. The danger is the greater that such water may be bright and sparkling, and peculiarly palatable.

That even sand has the power of removing dissolved matter from water was shown by Mr. Witt's valuable experiments at Chelsea, described in 1856. In one of these, *e.g.*, water containing 1·42 grains of chloride of sodium per gallon (70,000 grains) was deprived of 22 per cent. of that substance by filtration through a depth of 1 foot 9 inches of sand. The sand had no appreciable action on dissolved organic matter, as charcoal had, but the quantity of such matter originally present was small. It is probable that all finely porous material has such action, more or less. The efficiency of charcoal in this respect, and especially fresh animal charcoal, has been well demonstrated and utilized. The mode of the disappearance of dissolved organic impurities has been a disputed point. Some say they are retained and accumulated in the pores of the charcoal; but the experimental evidence seems to leave little doubt that they are mainly oxidized, so as hardly to impair the activity of the filter. In fact, the value of a filtering material will be found to depend chiefly on the power it has of bringing oxygen, stored in its fine pores or otherwise provided, into chemical union with the dissolved organic matter and destroying it. At the same time it is obvious that, chiefly by the mechanical action of straining, organic matter may accumulate in a filtering medium, and in course of time, through decomposition, render the water which passes through more impure and less wholesome than in its unfiltered state.

We may remark here that river water and shallow well water, while extensively used for water supply, are in general the most largely polluted. Rivers commonly receive large volumes of sewage, impure surface water from cultivated land, and other contamination. The water of shallow wells, especially in large towns, or when near churchyards, stables, cesspools, etc., is often contaminated with organic matter of the worst kind, in large quantity. While rain water, collected from the roofs of houses in butts, no doubt contains organic matter, this hardly bears comparison in amount to the organic impurity in rivers (thus Dr. Hassall found it a hundredfold less). Deep spring water, again, is freed from much of its organic impurity through natural filtration. The advantages of a good lake-supply for large towns has been amply demonstrated in these days, notably in the case of Glasgow, which draws its water from Loch Katrine.

Though the arrangements for water supply of most of our large towns include filtering processes by means of which, as a rule, excellent drinking water is abundantly provided, so that in the opinion of some chemists a domestic filter may be superfluous, while it is sometimes a source of harm (owing to lack of proper attention), it is generally thought a wise additional safeguard to employ one of those instruments, in view, more especially, of some of the possible consequences of epidemics and floods, and the necessity of house-storage of the water received. In country places, and in various other circumstances, their use is often quite imperative if the laws of health are to be respected.

The Japanese and Egyptians seem to have used water filters at an early period. These consisted of sandstone or unglazed earthenware, and were of bowl or egg shape, with small projections at the top resting on a wooden frame. The water poured into this vessel filtered through to a vessel below. About the middle of last century, slabs of a lias found in Picardy were used as a filtering agent, being fitted as a false bottom in water cisterns; the water was drawn off through a tap from the space below. A porous filtering stone of Teneriffe was at one time imported largely into England. The "alcarrhazas" are filter vessels of porous biscuit stoneware made in Spain.

One of the earliest filters in England was that patented by Mrs. Johanna Hempel in 1790. It was a supported basin made of tobacco pipe (or similar) clay and coarse sea, river, drift, or pit sand, and hardened in the furnace. In the following year (1791) the ascending principle was first applied by Mr. James Peacock. Water from an upper reservoir was admitted through a pipe to the bottom of a box containing strata of sand, gravel, and a mixture of charcoal and powdered calcareous stone. Passing up through this, it was drawn off by a pipe at the top. The filter was occasionally cleaned with an exhausting and condensing pump, which sucked up water rapidly through the filtering material and then sent it back with force, washing out the dirt.

The construction of filters is a matter on which inventiveness has been largely exercised. All sorts of porous substances have been called into requisition, as may be seen by a glance at the patent records. Thus, to mention some of these, we have various kinds of stone, sand, gravel, powdered glass, clay, porous sulphur, preparations of iron, charcoal (vegetable and animal), cloth, felt, horsehair, skins, paper, silicated carbon, sponge, wood, wool, cane, capillary threads, and so on. Vegetable charcoal, we may note, was first employed in 1802, animal charcoal in 1818, and solid carbon blocks in 1834.

It is impossible here, and it would be tedious, to give anything like a detailed account of the changes that have been rung on the filtering principle for domestic filters. In the simplest and most familiar forms, of course, the water passes down by its own gravitation through the filtering medium to a reservoir below. The force of downward pressure has sometimes been augmented by a head of water, sometimes by a force pump, and sometimes by means of air condensed above the water to be passed through the filter. Or the air has been extracted from the vessel containing the filtered liquid, thus adding force to the atmospheric presure above. The ascending principle has appeared in various applications; and in some cases the water has been caused first to descend and then to ascend through filtering material (a vertical partition, *e.g.*, being fixed in a vessel so as to reach nearly to the bottom, and layers of sand and vitrified limestone being placed on either side of the lower part; the water is poured in on one side of the partition and drawn from the other side near the top). Lateral filtration has also been tried. Filters have been arranged to act in the cistern, or in connection with the service pipe between the cistern and the water tap, or independently, and, in the latter case, either having the unfiltered water poured into them, or being placed in a vessel of it, and giving filtered water through a tube. Sometimes a series of separate connected vessels have been employed; and for very dirty water it is often advantageous to have one system of filtration for the coarser, and another for the finer impurities. Once more, filters have been rendered self-supplying by means of a ball-cock. These are some of the general forms which the filter has taken.

The application of pressure to filters cannot as a rule be pursued very far, for it tends to derange the apparatus and render the filtered liquid muddy. Enlargement of surface is a better means of obtaining rapid filtration. Upward filtration, while it offers some advantages over downward, has not hitherto come very much into use. It is open to objection in that the water sent upwards has a tendency to force a passage through certain channels, without being uniformly disseminated in the material; and the deposit of any filth is excluded from view, and mostly also from smell, instead of being exposed and giving us warning.

In passing now to examine more closely some of the approved forms of domestic filter at present in use, it should be borne in mind that while any of these filters will doubtless purify water both mechanically and chemically, more or less, it is only on condition of their being properly attended to, and the filtering material renovated at intervals depending on its nature and the nature and amount of impurity in the water. The term "self-cleansing," applied to some filters, may have a (limited) true sense, but if understood to imply that a filter, let alone, will go on *ad infinitum* giving pure water, it is quite inapplicable; solid impurities *must* accumulate and call for removal. The statement, occasionally made, that a filter is "warranted to remove all impurities" from water is absurd and hardly deserves notice. Absolutely pure water is a thing almost unknown; careful distillation alone will give an approximation to it. Again, the claim that a filter will remove *all* lime from water is often false; filtration is capable of removing only a small quantity of lime. It must be allowed that sundry points in the process of filtration still remain in some obscurity, and it is matter of regret that the action of some common filtering agents has not been so fully cleared up by scientific experiment as others. Still enough has been ascertained probably to guide to the construction of a filter on rational principles.

In a large proportion of filters, as already indicated, some form or other of carbon is the chief filtering agent. The well-known filters of Lipscombe are cylindrical-shaped covered vessels of glazed earthenware, in which the filtering medium, a mixture of vegetable and animal charcoal, in granular form, is enclosed between two slabs cemented in the case. The upper (glazed earthenware) slab has a central aperture with raised border, and a small perforated basin immediately below it; into this is inserted a sponge to arrest the grosser impurities, which is taken out and cleaned at short intervals. The filtered water passes through the lower (and porous) slab to the reservoir below, which communicates above with the outer air by a narrow tube passing up within to the top of the apparatus, and delivers its water through a tap.

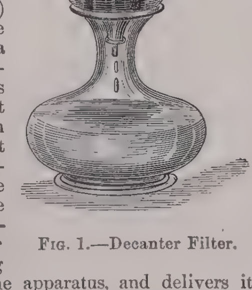


FIG. 1.—Decanter Filter.

Charcoal in the form of solid finely porous blocks, which can be conveniently brushed and cleaned externally, is now often moulded for filters. The convenient decanter filter in which the water passes through the block to a central tube, forms an elegant addition to the sideboard. The annexed figure (1) represents one of these as made by Atkins, who also furnishes earthenware filter vessels having a division across the inside wherein a carbon block is fitted water-tight, which can readily be taken out and cleaned and replaced, or a fresh one substituted. Sometimes the block is fitted in a movable pan. Again, in the filter shown in fig. 2 a double filtration is effected, the water passing first through loose charcoal B, then through a charcoal block C, supported as shown. The block in this case is said to last longer without cleaning. The movable and perforated earthenware plate A, which is placed above the charcoal (see fig. 3), allows of easy renewal of the latter. The charcoal used in these filters is chiefly of vegetable origin. They are found to remove more or less of organic and inorganic matter dissolved in water.

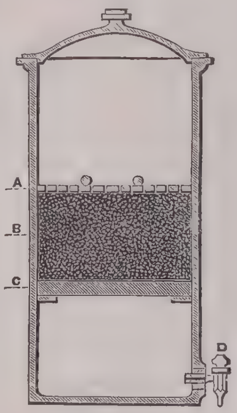

FIG. 2.—Filter with double action.

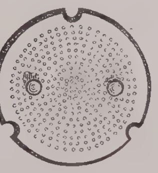

FIG. 3.—Plate at A in figure 2.

It may be useful here to call attention to some of the conclusions arrived at regarding charcoal in the sixth report of the Royal Commission on Rivers' Pollution a short time ago. *Fresh* animal charcoal has been proved to act powerfully in the removal of organic impurity (considerably more so than vegetable charcoal), as well as of mineral matter. But, according to Dr. Frankland, its reduction of the hardness ceases in about a fortnight, the removal of organic matter continuing even after six months, though to a much less extent, especially if the filter be much used. It was found necessary to renew the charcoal every six months when used for filtering the comparatively pure water of the London New River Company, whilst the water of the Thames required renewal of the charcoal every three months. If this be not done, myriads of minute worms, we are told, are developed in the material passing out with the filtered water. Other statements of scientific weight, regarding animal charcoal are more favorable to it, and seem to show that under certain conditions, perhaps imperfectly understood, it may give better results.

In Major Crease's system, which is adopted in the British army and navy, loose animal charcoal is compressed between plates by means of a screw, the amount of compression being determined by the degree of impurity in the water to be filtered.

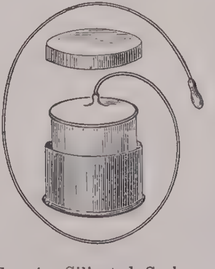

FIG. 4.—Silicated Carbon Siphon Filter.

The silicated carbon of Mr. Dahlke's filters is obtained by mixing animal or vegetable charcoal with the residue of distillation of Boghead coal. By adding a little clay to the latter product, and saturating the whole with oily matter, it can be moulded, after which it is burnt. In one form of the filter, two carbon blocks are sealed into the interior of an earthenware vessel, granulated carbon being placed between them; in another, a double action is obtained by placing a carbon block over the entrance to a second carbon medium. These filters have been highly commended for their chemical properties, attributed to magnetic oxide of iron present in the medium. We give (fig. 4) a representation of the silicated carbon siphon filter with its case. Water may be sucked through it from a stream directly into the mouth, or passed siphon-wise from one vessel into another. These and similar pocket filters of Atkins's were supplied to the Ashantee expedition.

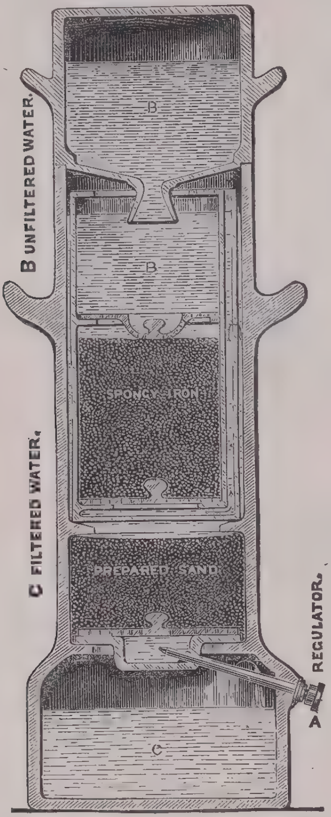

Fig. 5.—Bischof's Spongy Iron Filter.

A very powerful filtering medium was discovered and introduced many years ago by Mr. Thomas Spencer. It is called *magnetic carbide*, and consists of protoxide of iron in chemical combination with carbon. It is obtained by roasting hematite iron-ore with granulated charcoal for twelve to sixteen hours at a dull red heat. Mr. Spencer considers the purifying property of the oxide to be due to its power of attracting oxygen to its surface, without the latter being acted upon, the oxygen attracted being then changed into ozone, by which the organic matter of the water is consumed. The magnetic carbide is used in granular form. This filter gained prize medals at the last London and Paris exhibitions, and its efficiency was demonstrated by the *Lancet* Sanitary Commissioners' report on filters in 1867.

The only other system we shall here notice is that in which spongy iron is used. This substance is metallic iron which has been reduced from an oxide without fusion. It is in a spongy or porous state of extremely fine division. Its remarkable purifying action on water was discovered by Professor Gustav Bischof of the Andersonian University, Glasgow; and experiments made with his filters by the Royal Commissioners already referred to showed that their power both of removing organic matter and reducing the hardness of water even increased during upwards of eight months' constant use. The general form of the filter is represented in fig. 5. An inner vessel containing the spongy iron is supported in a case, which, below, contains some prepared sand, a regulator A, and a receptacle C, for filtered water (with tap, not shown). The unfiltered water B is in this form supplied from a bottle which is inverted into the upper part of the inner vessel (a method familiar to chemists). After passing through the spongy iron, the water ascends through an overflow pipe in the direction of the arrows; the object of this is to keep the spongy iron, when once wet, constantly under water, as otherwise it is too rapidly oxidized. The object of the prepared sand (which is generally in three layers, viz., pyrolusite at the top, then sand, then gravel) is to separate traces of iron retained in solution. The regulator A consists of a tin tube cemented in the position shown; it is open at the inner end, which is below the perforated bottom supporting the sand, and closed by a screw cap at its outer end. It has also a small lateral perforation, through which alone the filtered water passes into the reservoir. Should the perforations get choked, the screw cap is removed, and a brush inserted; on starting at first, too, the cap is unscrewed, that the materials may be well washed out without soiling the lower reservoir. With a ball-cock and constant supply of water, the inner vessel is dispensed with.

The nature of the action of the metal on organic matter is rather obscure. Mr. Bischof considers there are both reducing and oxidizing agencies constantly at work, and that the oxides of iron, being present in their nascent state,

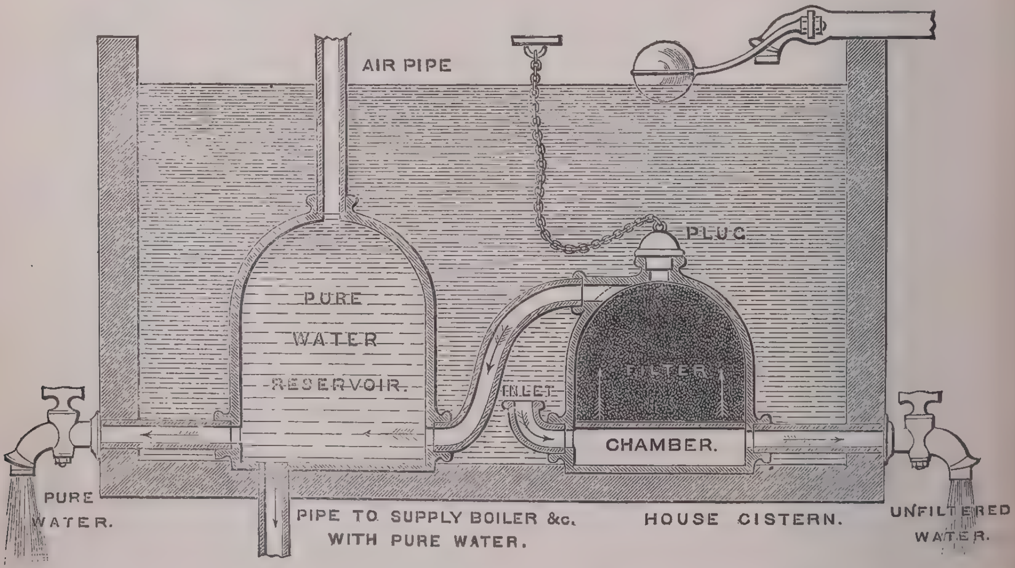

Fig 6—Lipscombe's Cistern Filter.

must be very energetic in their action. Probably ferric hydrate, the last product of oxidation, takes an active part in separation of the organic matter, transferring oxygen to it. Again, spongy iron is known to be very energetic in precipitating any lead or copper. Its reduction of the hardness of water presents some difficulty.

This filter, we may add, recently gained the prize medal for general excellence given by the Sanitary Institute of Great Britain, and has been otherwise commended.

The subject of cistern filters (of which there are many varieties) need not detain us long here. The arrangement adopted by Lipscombe, shown in fig. 6, may be taken as an example. The impure water passes through the inlet into the chamber of the filter, thence upwards through a plate of porous stone, then through powdered charcoal into the pure water reservoir, whence it may be drawn off cold by the pure water tap, or hot and pure from the boiler. When the filter is in action, the grosser impurities are stopped by the porous stone, while the finer pass into the charcoal and are chemically acted on. Each time the unfiltered water tap is opened to obtain water, unfiltered water enters the inlet and scours out the impurities in the chamber. To clean the filter, once every six months or other period, a plug is drawn up by means of a galvanized chain (attached as shown) from the top of the filter and dropped into the inlet. The unfiltered water tap is then turned on several minutes, so that the cistern water rushes down through the filter and out of the tap, carrying out impurities from the filter.

In the filtration of water for supply of towns, galleries of masonry are often constructed in the sand and gravel forming the river bed or banks; the water percolates through and enters these tunnels at the bottom and by side channels; it is thence pumped to the town. Genoa, Toulouse, Lyons, and Perth present examples of this system, which is apt to prove rather costly. The system of artificial filter-beds of sand resting on gravel, etc., is now more generally adopted. It was first introduced into London by Mr. Simpson, in 1839, after a study of various works in the north, and especially of the costly experience of Glasgow. For the Chelsea Water Company he had a series of tunnels built of brick without mortar; these were covered with a layer of fine gravel 2 feet thick, then a 2-feet stratum of fine gravel and coarse sand, and lastly 2 feet of fine sand, or 6 feet in all. The sand was periodically removed to the depth of about half an inch. To the filter bed, covering 1 acre, were attached two reservoirs, slightly higher; into these river water was pumped, which, after time for subsidence, was admitted to the filter beds through small pipes.

The eight Water Companies of London all use similar beds, increasing in coarseness downwards, of various depth and proportion of materials. A sharp siliceous sand is preferred for the upper bed (the true filtering agent), and the stratum is seldom made less than 2 or more than 3 feet thick. Sometimes this bed is laid immediately on a bed of small shells.

It is considered that filtration through sand, to be effective, should not proceed more rapidly than 6 inches of descent per hour (in the London beds the rate varies from 2·5 to 10·7 inches), and that there should be about 1½ square yards of filtering area for each 1000 gallons per day. The depth of water maintained on filter beds varies between 1 foot and 7 or 8 feet. The inlet arrangements should be such as to produce little disturbance of the sand in charging; thus the water may be admitted into a long trough from which it gently overflows, or through an inlet pipe carried to the centre of the bed and turned upwards (at Chelsea the water enters through a wall of gravel between two horizontal concentric arches of brickwork with vertical joints). The beds are drained variously, *e.g.*, by means of perforated stoneware pipes, or pipes with open joints, sometimes leading into a brick culvert which traverses the bed. A good method of draining is that of Mr. Muir, adopted by the New River Company. It consists of two courses of bricks laid flat and dry; in the lower, the bricks are placed end to end in series alternating with half-brick spaces which serve as drains leading to a central culvert; in the upper course, the bricks are laid close together, forming a floor, on which a thin layer of fine gravel supports a bed of sand.

Filter beds require to be cleaned, at intervals varying from one week to six or eight, by removal of about half an inch of sand. The clean sand remaining is loosened with a rake and exposed to the air some time, then smoothed over. The filter bed may be made with several compartments, some of which may remain in action while others are being cleansed. There are various contrivances for washing sand previous to its replacement. Filter beds are sometimes arranged to be cleansed by a reverse current sent upwards with force,—an operation which may be aided by stirring the surface sand after the water has come above it. Such a system is practised, *e.g.*, in the Greenock, Paisley, and Dunkirk water works. At the last-named place, washed coke is among the filtering agents used. (For an account of the works at Dunkirk see *Engineering*, vol. xiv. p. 206.) In the system of M. Maurraz the water is filtered both *per ascensum et descensum*, the two portions of water, which flow in opposite directions, uniting at the middle. The sand is retained in closed and perforated boxes. This filter also permits of cleansing by reversal of the current. Mr. Spencer's carbide system has been applied successfully on a large scale at Wakefield and other places, the carbide layer being combined with others of sand and gravel. With carbide, the total thickness of bed may be considerably reduced.

Filtering is frequently practised by the chemist. And whereas in the ordinary filtration of water above described the purified liquid is the object of the process, while the matter retained is merely to be got rid of and destroyed, the reverse may be the case in the laboratory, the retained matter being sought, while the "filtrate," as it is called, is disregarded. For most laboratory preparations the material used is unsized paper. Swedish filtering paper (which is prepared with very pure spring water) possesses the advantage of filtering very rapidly, and of being singularly free from inorganic matter. Cloth is employed in the case of viscid liquids such as syrup or white of egg; while corrosive liquids may be filtered through pounded glass. Asbestos is a valuable filtering material, since, by making it red hot, all organic matter may be destroyed, and acid and alkalies have scarcely any action in it. Being nearly indestructible, it can be repeatedly used. Glass-wool has also of late years been recommended.

Paper filters, to be placed in a funnel, are sold ready cut of circular shape. The paper is folded twice to the form of a quadrant, and this, when half opened, forms a cone, whose edges meet at an angle of 60°. To facilitate passage of the filtered liquid, small folds are sometimes made in the filter all round. In a filter devised by Bunsen, the neck of the filter is inserted in the caoutchouc stopper of a lower vessel, and through this stopper also passes a tube connected with an exhausting apparatus. The production of a partial vacuum below accelerates the filtering process. Sometimes substances have to be filtered under the influence of heat, as they solidify at ordinary temperature. In such cases the funnel may be surrounded by a sleeve containing water, which is heated with a lamp.

In Robinson's oil filter, oil is forced up from a cask into and through the filtering apparatus (containing charcoal or other medium) by water entering below from an upper reservoir. Sundry modes of filtration practised in the arts (sugar-refining, etc.) will be referred to elsewhere. In some of them centrifugal force is employed.

Circumstances are not uncommon in which it is very desirable to remove impurities from air by a process of filtration. Cutlers and other grinders use respirators to arrest the small particles which would otherwise find their way into the lungs. For steel particles magnetic gauze is an efficient protective. Professor Tyndall's respirator for firemen consists of an iron cylinder, attached to a mask, and containing charcoal, and three layers of cotton wool, one moistened with glycerine; the ends of the case are of wire gauze. With this respirator it is possible to enter an atmosphere of dense smoke and remain in it over a quarter of an hour. The disinfecting properties of charcoal have been turned to good account by Dr. Stenhouse for purifying air, the substance being used in the construction of respirators, or at the outlet of sewers, etc. An interesting application of the principle was made in the justice room of the Mansion House, London, in 1854, where offensive smells originating just under one of the windows were effectually removed. There are various devices in existence for purifying the air admitted to railway carriages and other inclosed spaces. Thus the air may be passed through wire screens, or through a spray of water, etc. In connection with biological research and the germ theory of disease, the removal, by filtration, of minute foreign particles from air is a matter of great moment.

FINALE DELL' EMILIA, a town of Italy, circle of Mirandola, province of Modena, is situated on the right bank of the Panaro, 10 miles from its junction with the Po. It receives its name from its situation on the border line between the duchy of Modena and the States of the Church. It has manufactures of silk and woollen fabrics, and some trade in corn, wine, hemp, and fruits. Finale owes its origin to a castle connected with the monastery of Nonantola. The town was taken by the imperial troops in 1703 on its being abandoned by the French. It was again taken by the French in 1704, and by Prince Eugene in 1706. The population in 1871 was 4456.

FINANCE. In the 13th and 14th centuries, the words finare, finacio, and financia were employed, principally by writers in France, to denote those bargains by which the indefinite liabilities of ancient tenures were commuted for fixed sums payable to the immediate lord of the tenant. It was at this time that the commutation became general, except when the service of the tenant was of a military or dignified character. Even here, however, a remarkable innovation was made at an early period in English social history, on which we shall comment presently. In course of time the word finance became nearly synonymous with the product of taxation, and the finances of a country (though the phrase is sometimes used to denote the aggregate revenues of those who are liable to taxation) are understood to be the ways and means by which the expenditures of government, imperial and local, are met. In the present article we shall deal with the history of finance only. Under the head of TAXATION, the reader will find an analysis of the economical theory, in accordance with which taxation is shown to be innocuous and equitable, or the reverse.

The most ancient forms of finance have always been taxes on produce. Such appear to have been the taxes of ancient Egypt; such were and still are the principal taxes of Turkey and Hindustan. Whatever may have been the character of the first agricultural settlement, the development of a central government has always been assisted by a theory that the true lordship of the soil is the property of the state or the ruler, on which the immediate occupant of the soil is dependent, and to which a portion of the produce is due. The conquests of Rome always involved a confiscation of the vanquished nation's land, and the re-grant of a portion of the confiscated estate on what we might call by analogy a base tenure. In the same way, when in the 10th and 11th centuries the Christianized Teutonic tribes of north-eastern Europe pressed on the heathen Slavs, the victory of the former was always followed by the establishment of a military and well-endowed church, on which a third of the conquered territory was generally settled, the vanquished race being permitted, though in a state of dependence, to occupy the residue. The settlement of Ægina and Eubœa by the Athenian lot-holders, to say nothing of more ancient occupancies, was of the same character. Here indeed the state distributed the ownership which it had acquired by its arms among its citizens, though doubtless it claimed military service from them as a garrison, and probably exacted a revenue which was similar in its nature to a rent.

The financial system of ancient states was, as a rule, exceedingly simple. The charges of government were few, except in the vast despotisms of Asia and Egypt, and later on in the great military republics of Carthage and Rome, where the revenues of the king and state were derived from tribute in money or kind from inferior or dependent districts and races. The district of the Aristotelian ideal city (*Politics*, vii. 10, 11) is to be divided into two portions, one the property of the state, out of the produce of which the charges of the national religion and the costs of the common tables are to be supplied, the other to be held in private ownership. The philosopher does not contemplate the necessity of making provision for the ordinary charges of government. The magistrates were unpaid; the army was a militia, serving at its own charges. When the Lacedæmonians undertook the command of the allies in the Peloponnesian war, they had no public revenue. Later on in their history, we are told by Aristotle that the public exchequer of the Lacedæmonians was ill managed, for most of the land of Laconia belonged to the Spartiats, and they assessed themselves.

The beginning of Athenian finance was a revenue derived from the silver mines in the promontory of Sunium, the ownership of which was, it seems, vested in the state. It was the practice of the Athenian Government to grant a perpetual lease of allotments in these mines, and to exact, moreover, a small percentage on the produce, reserving to itself a right of forfeiture and re-entry if the terms of the lease were infringed, or the produce rents were unpaid. With the proceeds of these mines the Athenians built their first navy, and with this navy they won the victory of Salamis, thus paving the way to their naval supremacy.

The next great source of Athenian revenue was the contribution from those protected states which failed to supply a proper naval contingent for the defence of the Ægean. Most of the Greek cities of Asia Minor and the islands owed their security from the attacks of the Phœnician navy, then dependent on Persia, to the vigorous and effective sea forces of the Athenian republic. It was cheaper for them to commute their contingent for a money payment, and the police of the sea became far more efficient when wielded by a single power, which had every interest in bringing its navy to the highest pitch of serviceableness. The Athenians contrived to economize, and, later on, to increase the contributions of those states whom they protected. Considering that they had fully satisfied the terms of their own bargain if they thrust back the Persian despot, they concluded that they might fairly accumulate a surplus in the public treasury, and even expend a portion of their revenues in embellishing their city. We may be certain that the power which this revenue gave the Athenian republic was the chief cause of that jealous fear which precipitated the thirty years' war of the 5th century B.C., and which produced results as disastrous to the progress of mankind as a war of the same duration twenty centuries later did on the rapidly growing civilization of central Europe. So desperate and so penniless were the military rivals of Athens, overwhelming as their land forces were, that they even thought of appropriating the sacred treasures of Delphi, a proposal, in the 5th century before Christ, which was as shocking as it would have been in the 12th century after Christ to have suggested that the sacred vessels and shrines of the great churches and monasteries should be coined in order to pay the soldiers of the crusade.

The finance of antiquity derived a revenue from customs. These customs were, at least in Athens, an ad valorem duty of two per cent. as a war measure. Twelve years before the conclusion of the great thirty years' struggle, the Athenians levied a five per cent. ad valorem duty on their subject cities, though this was in substitution for the old contribution on account of the police of the seas. A poll-tax was levied on foreign residents, perhaps on slaves; and it appears that, possibly as a measure of police, another poll-tax was imposed on the inmates of disreputable houses.

The revenue, therefore, of that Greek state whose history is best known to us was derived from the rent of public lands, especially the mines, from a composition paid by the allies in lieu of naval service, from very moderate customs duties, and from a few personal taxes. It must not, however, be imagined that the finance of antiquity was successful in the eyes of those who saw how inelastic it was. There is still extant a treatise by a very practical man. Xenophon, in the oldest work on finance, discusses the means by which the Athenian home revenue might be conveniently increased, and, like many other speculative thinkers, suggests projects which would have created far more mischief than they would have remedied. It will be obvious, also, that by far the most important item in Athenian finance, the contributions from the allies in lieu of personal service, was necessarily precarious, and that when the Athenian empire was finally broken up, the revenue of the state was gone, while the necessity of finding ways and means for the public defence was as urgent as ever.

This brings us to another aspect of Athenian finance, viz., the extraordinary taxes on property which the Government levied, and which the contributors paid apparently with the greatest readiness. These were the *Λειτουργίαι*, exceptional imposts with a view to defraying certain kinds of public expenditure; and property taxes assessed on a valuation, and graduated according to the means of the contributor.

The principal liturgies, as they are called from the Greek word quoted above (the word is suggestive of the process by which it was finally appropriated in the ecclesiastical vocabulary), were three in number, two religious and one secular. The tendency of a religion like that of Greece, in which so much nature-worship was contained, was to associate many of the acts of life with religious ceremonies, and, as culture progressed, with art. Thus the drama of antiquity arose from the worship of the wine-god and the vintage, and the arts of sculpture and painting had originally a similar religious origin. The dramatist who succeeded in securing a representation of his composition had assigned to him a citizen whose wealth was sufficient to defray some of the charges of representation, as the instruction, maintenance, and dresses of the actors. A second and similarly religious service was the public games. Here again a considerable portion of the expenses incurred in the performance were imposed on wealthy persons. The third was the trierarchy, the equipment and command of a ship of war. The state supplied the ship, the trierarch its stores and tackling, and in some cases provisions and pay. In return, the trierarch was captain of the ship. This arrangement is closely analogous to that financial arrangement in England by which, after the Revolution, local regiments were raised, clothed, and officered by wealthy men, who had in return the colonelcy of the regiment, and the right of appointing its subordinate officers.

The liability to these charges, distributed, as it seems, at the discretion of the Government, was a serious charge on the wealthy. Hence, when the state fell on evil days, and reverses had impoverished the Athenian people, persons were allowed to club together in order to supply these public functions. To abandon them would have been to incur the wrath of the gods, or imperil the safety of the state. The modern critics of Greek sentiment are amazed at the fact that only on the very eve of the great crisis in which the fate of Greece was finally determined, the battle of Chæronea, Athens reluctantly devoted the taxes which had hitherto been employed for ecclesiastical purposes to the pressing necessities of the public defence. The theoric fund was that portion of the revenues of the state which was assigned to those sacred purposes. It was distributed nominally among the spectators as the price of tickets for admission. It actually was paid over to the managers of those public buildings in which the ceremony was performed.

If the person on whom the duty of supplementing the charges of the state was imposed conceived that he was unfairly selected, or asserted that his means were inadequate for the purpose, he was allowed to name another citizen to whom he could proffer an exchange of property. In this offer the other was bound to acquiesce, unless he consented to allow himself to be substituted for the individual on whom the duty was originally set. In short, the possession of property involved serious liabilities in Athens, though it seems that men of substance gloried in the satisfaction of these public charges, and completely conformed themselves to public opinion. For it will be found to be a fundamental law in successful finance that those imposts are always found to be most productive which are most in accord with public opinion, and that in the selection of a system of taxation it is not always possible to adopt that which is most expedient or even most just, but that which can be most readily enforced and is most willingly accorded.

But the most remarkable illustration of Athenian opinion in matters of finance is the regular property tax. In the costly services which have been sketched above, some compensation was afforded to the contributor by the position he occupied. The choragus was the chief official in rank at those religious ceremonies in which the drama was the highest act of worship; the chief of the gymnasts exercised authority over his staff of competitors in the public games, and was even empowered to compel parents to allow their children to take part in the contest. The man of substance on whom the state imposed the duty of equipping, manning, and provisioning a hull was captain of the vessel, and though he was liable to a due performance of his service, and subject to an audit on the termination of his year of office, he exercised full authority during his command, and might be, indeed was, rewarded for exceptional diligence and smartness during the period of his office.

The property tax was a contribution which did not make the tax-payer conspicuous, and did not confer on him any distinction. The impost dates from the earliest records of the Athenian constitution. It was graduated, being a heavier percentage in the case of the richer citizens than in that of the middle classes. It passed through several notable changes, always, however, in the same direction, the particulars of which are well given in Boeckh's *Public Economy of Athens*. But the principles of the assessment are very simple, though the process by which the result was finally arrived at is somewhat artificial.

The property of every Athenian citizen was assessed, whether it were movable or immovable, and the amount was entered in a public register. The assessment included the value of slaves, manufactured goods, and raw materials. A register of the assessment was open for examination, and undoubtedly re-valuations were frequent. The state was informed as to the property which each citizen—and indeed every resident alien—possessed, and made this property the basis of direct taxation. It then proceeded to divide all assessments into several schedules, assuming in each schedule a variable quantity, varying from a fifth to a tenth, as the taxable property of the individual. On this sum it levied a fixed rate. Thus, if a very wealthy man possessed an estate valued at 500 talents, *i. e.*, nearly £122,000, his taxable wealth was treated as £24,400, and a five per cent. tax, £1220, exacted from him; while the owner of property valued at 25 minæ, *i. e.*, about £101, 10s, the lowest sum apparently which was liable to property tax, found his property assessed for purposes of taxation at £10, 3s., and his property tax of five per cent. at a little over 10s.

In the budget speech which the great statesman of the Athenian empire delivered before the commencement of the Peloponnesian war, and of which Thucydides gives us the heads, we learn that the revenue of Athens from the contributions of her allies amounted on an average to 600 talents (£147,250) a year, and that there was an existing accumulation of treasure in coined silver amounting to a million and a half sterling, besides other immediate resources. It is to be regretted that the historian did not supply us with further particulars as to the finance of his country during the period of her greatest wealth and power. These resources, had Athens merely carried on a defensive warfare, would, as the statesman justly argued, have rendered the country not only unconquerable, but practically invulnerable.

The high rate of interest, and the general insecurity of society, excluded the states of ancient Greece from having recourse to regular loans, though not from attempting to meet current exigences by anticipations of revenue. Occasionally portions of the revenue were assigned to creditors; sometimes the public lands were granted for a term, during which the principal and interest might be repaid. Instances may even be found in which the state issued a currency of tokens, which fulfilled some of the functions of state paper in modern times. Another financial expedient, always followed by the most mischievous consequences, was occasionally adopted, the issue, namely, of a debased currency. But from this fraud Athens always kept herself free, not only inflicting the punishment of death on those who put base money into circulation (the criminal code of Athens having been generally very lenient), but abstaining in her deepest distress from the temptation of supplementing her revenues by the temporary issue of base money. So studious was Athens of her reputation in this respect that, when she was the home of the fine arts, she continued to maintain the clumsy archaic type of her coinage, although the arts of die-sinking and coining were carried to perfection in states which were far less scrupulous.

The revenue of Rome in the earlier ages of the republic was derived from the lands of the state, payments in kind or money from subjects, from import and export duties, and a few taxes on products and articles of luxury. Partly as compensation for the loss of the national domain, partly as a means of checking discontent, the state, in the later ages of the republic and the beginning of the empire, undertook the maintenance of its poorer citizens, either by gratuitous distributions of corn, or by the sale of food at low fixed prices. Cicero calculates the charge incurred by the revenue in consequence of this expedient at one-fifth of the public expenditure. Augustus increased the charges of maintaining these state paupers till the cost amounted to more than half of what had been the revenue of republican Rome. The emperor Vespasian declared (Suet., *Vesp.* 16) that the necessities of government in Rome required a sum of £400,000.000 sterling, apparently after the destructive civil war which preceded the elevation of the Flavian family to the throne. But the manner in which the revenue of the Roman empire was collected was even more destructive than the crushing weight of the charge itself.

The collection of taxes in Rome, both under the republic and the early empire, was entrusted to contractors, who purchased by auction the right of levying the tax. The character of the Roman contractor is aptly illustrated by Livy, who narrates the frauds practised by those persons on the Roman treasury during the deepest distresses of the second Punic war, and the violence with which other contractors defended the interests of the order in general, and the convicts in particular. But after the Macedonian war, the Roman citizen was relieved from direct taxes, the weight of which fell on the provincials. Associations of wealthy men were formed, who could give security to the Government, and who, being protected by the Government, could practise what extortion they pleased on the provincials. The law, indeed, provided that such persons should be liable to prosecution for corrupt and illegal practices, but the law was far too weak to check the malpractices of the officials. It appears that the province was divided into districts, or dioceses, as they are called, a manager being appointed for each district, who was in regular correspondence with the chief of the office at Rome. The law recognized the guild of the publicans, who were indeed, by their agency, the centre of the Roman system of finance, and in many emergencies the parties with whom the state negotiated for an advance on the security of its revenues. But, on the other hand, it was said with too much truth that where the tax-gatherer appeared public law and private liberty vanished.

Taxes paid in kind were the tenth of corn and the fifth of fruit. Such taxes were imposed in Sicily, in Africa, in Sardinia, and in Egypt. Spain was treated more generously, partly to compensate for the reputed unproductiveness of its soil, partly in all likelihood from fear of the high-spirited character of its inhabitants. In some cases, the contributor of the tithe had to carry his quota to the nearest port for shipment to Rome. The rest of the empire paid money taxes, partly from an assessment on the value of property, partly by what appears to be a poll tax, but was really an artificial estimate, under which several needy persons might be made to represent a unit, and on the other hand one wealthy person might be treated as many units. The assessment lasted for a definite period, which, in the age of Constantine at least, got the name of the Indiction. In the sense of a tax, this term is as old as Pliny, if indeed it cannot be carried back to the early empire.

The finance of the Roman empire imposed a tax on the profits of trade, which seems to have been collected with great severity, and to have exposed those who were liable to it to strict scrutiny, and to degrading punishments in case of default. Capitation taxes were levied on cattle, on imports and exports, on slaves kept for the purpose of luxury, on auctions (1 per cent.), on sales in the public markets, analogous to the octroi in the French towns, on salt works, on emancipated slaves, and on successions in cases where the inheritance went by devise to strangers. The Roman empire even anticipated the benevolences of the Plantagenet and Stuart kings of England in the coronary gold, which was first received as a present on the occasion of a triumph, but afterwards exacted as a right on such occurrences as the emperor might choose to proclaim.

The distinction of Roman and provincial was merged in a common servitude under the edict of Caracalla, which conferred the Roman franchise upon all the subjects of the empire. The task of collecting and transmitting the taxes from the provinces to Rome, and subsequently to Constantinople, was imposed on the decurions, the senate of the colonies. These persons exercised what little authority was left to the local magistracy by the centralization and despotism of the empire, and were exempted from some of the more degrading punishments which were imposed on the mass of the people. But they bought their rank and privileges at a dear rate. They were liable, in case they failed to collect it, to the whole impost which was assessed on the locality whose affairs they administered. To escape from the dignity and responsibility of the decurion's office, without sinking into the condition of an unprotected citizen, was the object of numerous petitions to the emperor. The privilege was occasionally, sometimes lavishly, awarded as a matter of special favor. But the necessities of the public revenue demanded that enough decurions should be left for the purpose of meeting the burden of taxation. Hence, under the financial system of the later empire, the weight of fiscal charges fell with increasing severity on the middle classes, so that at last, when the military system of Rome collapsed, nothing remained to withstand the assaults of the barbarian invaders. One is struck at finding how small are the armies which subverted the Roman empire, and how easily they occupied Gaul, Spain, and northern Italy.

The fiscal and military system of the Roman empire caused the downfall of ancient civilization. The Roman army and the Roman exchequer were developments from a centralized despotism. The army exhausted the free growth of Italy, devoured the population of those most warlike races who were successively allowed to recruit the Roman legions; and when the subject races, from which new blood could be introduced into the forces, were thoroughly drained, the Government was forced to enlist soldiers from those foreign hordes who were already threatening, and were soon about to overthrow the empire. Civil society was simultaneously crushed by a prodigious weight of taxation, arbitrarily imposed, and rigorously exacted. Before the final collapse occurred, wide regions, once occupied by opulent and populous cities, were found to be destitute of inhabitants, and released from taxation on the plea that there was no population left from which to collect a revenue. Large tracts of Asia, southern Europe, and northern Africa have never recovered from the desolating effects which were induced on them by the fiscal and military policy of imperial Rome. A great break occurred in the history of human progress. Social development was thrown back for centuries, and in some particulars has not even yet recovered the ground on which it stood in the first century before our present era. Not a few fragments, too, survive from that imperial system which was the downfall of ancient civilization, and which will remain an impediment to modern civilization until they are completely taken out of the societies in which they have been embedded.

The history and progress of modern finance may be best studied in English fiscal history. Some countries, as Holland, adopted expedients in finance long before other states understood or accepted them; others, as France, have been informed by many acute authors of the means by which a sounder, fairer, and more productive fiscal system might be adopted in place of one which was ruinous, oppressive, and unproductive. But in England only theory and practice have gone on together,—not indeed simultaneously, for the English legislature has accepted scientific principles with hesitation and slowness, but progressively, the result being a compromise, which is open indeed to serious criticism from the point of view of the economist, but is, under existing circumstances, of easy manipulation to the financier. Into the former of these we do not propose to enter; it will be treated under TAXATION; but the latter can be presented from an historical point of view.

English finance is historically connected with the foundation and growth of the English exchequer. It is further divisible into two periods,—one in which almost the whole income of the sovereign, acting for the state, was derived from direct taxation; another in which a continually increasing revenue has been obtained from the indirect taxation of consumable articles. The dividing line in these two systems is the civil war of the 17th century; and it may be affirmed confidently that nothing but the emergencies of a great convulsion like that of the parliamentary war could have reconciled the English people to so total a change in the system of taxation as the adoption of the excise was. For more than a century after the compromise was effected, of which the perpetual or, as it was called at first, the hereditary excise was the outcome, the impost was detested. A generation has hardly passed away since offences against the excise have ceased to command public sympathy, and, despite the severity with which the law treated frauds on the revenue, have been looked on as venial acts, detection in which was rather thought unlucky than scandalous. We no doubt owe the change in public sentiment, in accordance with which frauds on the excise are considered criminal, to the happy change in the fiscal policy of the country, under which taxes are imposed for the purposes of revenue only, and are no longer seen to be protective or partial.

The origin of the English exchequer is variously ascribed to William the Norman and his youngest son Henry I. It is certain that the great cadastre of Domesday Book, the terrier of inhabited England, was treated as the register of the exchequer, the authority of which, as a record of the crown's title to lands and services, and of the subjects' tenure, was held in the exchequer court to be conclusive. It is also certain that whatever arrangement may have been made by the first and third Norman kings, the system was suspended during the troubles of Stephen's reign, and that the exchequer was reconstructed by Henry II. It appears, too, that the machinery of the exchequer was perfected by a family of clerical financiers, who held at once high dignities in the church and confidential offices in the state; that they were, and avowed themselves to be, eager advocates of regal rights; and that they strove to extend, as far as possible, the liabilities and responsibilities of the subject towards the crown. They also found means by which the judicial powers of the crown, the protection which the powers of police wielded by the crown could afford to the subject, and even the validity of contracts, were made the machinery for securing a revenue.

The Norman and Plantagenet kings were not only the overlords of all their subjects, and therefore interested in the escheat of their estates by failure of heirs, but by far the largest landholders in the country. The royal estates were managed, at least in the 13th and 14th centuries, just as the estates of the nobles and gentry were. They were superintended by bailiffs, generally of very low social rank, and cultivated by customary and hired labor. The profits of the estate, as long as this system was continued, were paid into the exchequer by the bailiffs, and after the king ceased to cultivate land with his own stock and capital, the collectors of rents succeeded to similar duties with those of the more ancient bailiffs. The sheriffs collected the customary charges which were imposed on the counties, and the extraordinary receipts of the crown, making audit of their liabilities twice a year, and receiving a quittance when those liabilities were discharged. Careful search was made into the estates of deceased tenants of the crown, and the antiquary or genealogist has derived the largest amount of his information as to family and local history from the numerous and exact *inquisitiones post mortem* which were taken by the proper authorities. As certain offences involved a forfeiture, and as all offences might be condoned by the payment of mulcts, the attention of the royal officials was stimulated to all such cases of misconduct, and except in matters of petty police, adjudicated in the manorial courts, the royal tribunals rapidly superseded private jurisdictions. In England these private jurisdictions disappear in the middle of the 14th century; in Scotland they survived till they were abolished after the insurrection in 1745; in France they existed till the eve of the Revolution. Nothing has tended so much to develop English nationality, and to consolidate the authority of the crown, as the royal tribunals, working through and for the machinery of the exchequer.

As the King's Bench dealt with pleas of the crown, when the king's peace was broken, and the exchequer hunted up and punished offences against the revenue, and through both agencies assisted the revenue, so a further source of royal income was derived from the fees levied for the administration of justice between subject and subject. There are many forms of conveyance known to those who are curious in legal antiquities. But the court of Common Pleas competed against them, by recognizing a form of conveyance transacted in court, recorded, and thereupon protected by valid evidence of title. "No assurances," said Clarendon, when, in the full tide of revived loyalty, the cavaliers of the Restoration strove to reverse or make void disadvantageous or forced sales made by themselves during the course of the civil wars, "are equal in validity to titles created by fines," as these kinds of conveyances were called. "There is no precedent of their being vacated by judgment or Act of Parliament, or otherwise, without the consent of the parties." So conclusive was this form of conveyance, that when Viscount Purbeck surrendered his title to the king by the process of a fine, the Lords, though they protested against the act, did not venture on demanding that it should be void. This form of conveyance also supplied a revenue to the crown. The exchequer, in short, was ubiquitous, constantly searching after means by which the finances of the crown could be recruited or enlarged, and sometimes offering very solid advantages to the subject in return for business of which the law courts, centred in the exchequer, took cognizance.

Besides these revenues, the crown derived an income from the corporations whose charters were granted in lieu of annual payments, and were renewed on further payments. Sometimes the accession of a new sovereign was made the the ground for fresh demands on the re-grant of charters, and payment was always expected for the concession of new rights. All these receipts, from whatever sources derived, were entered in the annual registers, the great rolls of the Pipe, a series of documents still preserved, and extending without break from early in the reign of Henry II. down to the reign of William IV., when offices, long obsolete, and already mere sinecures, were abolished. But for nearly seven centuries the financial history of England is contained in an unbroken series of public records, carefully made up from year to year, and as carefully audited. And as the receipts of the exchequer were exactly scheduled, so the payments were checked. No mere order, even of the sovereign, was valid for payment, unless it were countersigned by some official—originally the treasurer—and therefore duly subjected to a formal examination.

It is reasonable to conclude that arbitrary taxation was, if not unknown, always unconstitutional in England. The strict definition of the crown's rights in relation to revenue, which Domesday Book defended, and which the exchequer interpreted, naturally suggests that the rights of the subject were equally acknowledged and intelligible. Hence it was a general opinion, pretty freely expressed when the administration was unpopular, that the king should live within that income, in ordinary times at least, which had, under good management, been found sufficient for the dignity of the crown, and the good government of the kingdom. The risk of the crown's impoverishment, and the consequent necessity of grants from the subject, made the English people exceedingly hostile to favorites, and led parliaments to recommend or even insist on a resumption of grants. The improvidence of Henry III. led to the Barons' War. The worse improvidence of Henry VI.'s administration, when the crown was in abject penury, was a principal stimulant to the party of the duke of York. The last echo of this discontent was the dissatisfaction felt at the grants made by William III. to the Bentincks and the Keppels, grants which had to be revoked in part, and which were only confirmed in part by the adroit manner in which the Whigs proposed to extend the same resumption to the estates bestowed on the numerous illegitimate children of Charles II.

One financial expedient, however, adopted, as is supposed, at the instigation of Becket, and certainly introduced in the middle of the 12th century, had such lasting and peculiar effects on the fiscal and political system of the country that it should be explained. This was the commutation of foreign military service for a fixed money payment.

The policy of Henry II. was to strengthen the revenue, and to make it the instrument of government. Beyond his immediate and obvious interests, the warning which he derived from the straits to which his great rival Louis VII. was constantly reduced was enough to make him eager to secure and perpetuate the means for carrying out his own designs. The expedient on which he hit led to three results, two of which had an overwhelming influence on the mediæval history of England and of western Europe, while in the third was contained the solution of the greatest problem with which civilization has had to grapple, which ancient politics failed to grasp, but which is the great victory of modern politics. The commutation of foreign military service for a fixed money payment was, first, the cause why the Norman settler and the subject Englishman rapidly developed a common sentiment against the royal prerogative; was, secondly, the origin of that irresistible English army before which, till it was rivalled by the Swiss infantry, no feudal levy could hold its ground; and, thirdly, was the unwilling parent of representative government, of parliamentary control, and finally of scientific finance.

The king, under that system of reciprocal obligation between overlord and tenant which is called, somewhat loosely, feudalism, had a right to the military service of such among his subjects as held lands by military tenure. Sometimes, to be sure, as in France and Germany in the 11th and 12th centuries, the suzerain was not in a position to enforce the obligation; sometimes, as in the kingdom of Jerusalem, the obligation was rendered stringent by the necessity of defence against a common enemy. It would seem that the position of the English king and Norman duke was intermediate to the above. There was no doubt that he could call on his subjects in England to do battle on behalf of interests which were indisputably insular, his Norman subjects for such interests as were indisputably continental. But it was not quite so clear that an English tenant was bound to defend the transmarine interests of the English king, or that a Norman, a Gascon, or Languedoc tenant should be constrained to vindicate the English rights of a Norman duke. But there was so much to be said on behalf of the king's claim that a compromise was possible, and it was so much to the advantage of the English monarch that such a compromise should be made, that the bargain known as escuage or scutage was struck between the English king and his barons.

Military service rendered by a military tenant was a tax in kind. In 1158 Henry II. laid claim to the great fief of Toulouse in right of his wife. If this fief could be transmitted through females, his claim, according to the public law of the time, was good. But another family had been in possession for nearly a century, and it was plainly inexpedient to the French king that his dominions should be completely girdled round, from Flanders to the Alps, by the fiefs of the English king, who, by various titles, had inherited or claimed the whole seaboard of France. The recovery, therefore, of the fief of Toulouse was sure to be an arduous task, and in effect Henry did not achieve it. But by bargaining for a money payment instead of personal service he could supply himself with the most effective means towards the object aimed at. A feudal army was collected slowly, was destitute of solid organization, and was at once disbanded when the time of its service was passed. An enlisted army, paid and commanded by the sovereign, gathered by careful selection, and drilled with all the skill which the age possessed, was a far more efficient instrument of warfare.

The assize of arms under which the militia was enrolled defined the equipment of the national forces as precisely as those of Rome were defined under the so-called constitution of Servius. Each social order had its proper arms and place in the army. None but freemen were entitled to serve. But in the king's enlisted army a serf could be enrolled, and rise to knighthood and even to nobility. During the long wars of Edward III. many such persons of originally ignoble birth became distinguished captains. The royal army became, like the church, the road by which humble merit might be promoted to rank and affluence. Such an army, was highly paid, well drilled, rapidly manœuvred, and prodigiously effective. Though small, it easily routed hosts many times greater in numbers than itself. The chivalry of France went down before the English footmen at Crecy, Poitiers, Agincourt, and Verneuil, as the Persian armies were destroyed at Granicus, Issus, and Arbela, and as the native forces of India were routed at Plassy or Assaye. It is true that these English victories were ultimately barren, because the victors were too few to hold the country which they conquered. But in action, as long as the army was true to its drill and discipline, it was irresistible, and could only be beaten or dislodged in detail. Perhaps it is not too much to say that the tradition of these exploits has had a permanent effect.

Again, the commutation first adopted in 1158 united the two races, Norman and English, in a common policy. In accordance with the spirit of the time the bargain was a record and a precedent. If it strengthened the king's military power, it weakened his civil power. The feudal chieftain might not be unwilling to undertake a campaign from which he might get plunder or glory, or the solid advantages of successful and appreciated service. But it was another thing to find the funds from which others might be hired, and drilled, and win these advantages. The military tenant began to criticise the sovereign's policy in undertaking foreign wars, and to demur to his demands for escuage. His natural ally against the power of the crown was the free peasant. In little more than half a century after the bargain which Becket made with the military tenants of the crown, the whole nation, churchmen, nobles, burghers, and peasants, were united against John and his mercenaries, forced the Great Charter from him, and despite the anathemas of the most powerful pope which ever sa at Rome, insisted that the Charter should be maintained The history of no European nation supplies a parallel to the events of 1215. It will be found also that this common purpose influenced the minds of all ranks of Englishmen, till, under the unhappy reign of Henry VI., the feuds of the nobles made havoc of English liberty for a century and a half. But it was during the period of national resistance to the excesses of prerogative, *i. e.*, during the 13th, 14th, and the first half of the 15th century, that those precedents were created which served the parliamentary opposition of the 17th century to such good purpose.

In the third place, the commutation of personal service was the true cause of parliamentary representation. It is known that the earliest traces of representation are to be found in those elections of county knights who were appointed to assess the contributions for extraordinary necessities which the irregular councils or assemblies of the earlier Plantagenet kings had conceded. From local or county assessments to a national or general assessment, based on uniform principles, was only a step. At first there was no need that any but the country districts should be dealt with in this fashion. The resources and liabilities of the towns were well known, and the king could treat directly with the borough authorities. These relations of the crown to the chartered boroughs is the explanation of those anomalous franchises which characterized so many of the boroughs before the Reform Act of 1832. At last, in 1265, Simon de Montfort summoned the representatives of the boroughs as well as the counties, avowedly for the purpose of obtaining their adhesion to his policy, and the precedent was copied thirty years later by Edward I.

How the parliament gradually, through its control over the supply of funds for the extraordinary necessities of the crown, undertook the cognizance and remedy of abuses, assumed legislative functions, affirmed its own privileges, debated political questions, changed or determined the succession to the crown, extended or narrowed the franchises of the electors, and criticised the royal administration and expenditure, is matter of familiar history. The origin of the English parliament was peculiar, as its place in modern European history was unique, till, at the conclusion of the 18th century, other countries began to imitate the forms and traditions of the English constitution, and at last a free parliament has become a symbol and condition of constitutiona government.

It has been stated that finance, during the Plantagenet and Tudor dynasties, consisted mainly in the occasional imposition of direct taxes. The crown made known its necessities, and the parliament declared the amount of supply. At a period which is not settled, the right or duty of originating supply became vested in the lower chamber. It is probable that this great privilege, to which the House of Commons owes its ascendency, but which was formally conceded only in the reign of Charles II., was partly due to the willingness of the Lords to throw on the lower chamber the odium or danger of refusing or cutting down the demands of the crown, partly to the original character of parliamentary representation,—the fact, namely, that it was called into being for the purpose of assessment. In course of time, the House of Commons assumed the right of giving validity to the grants of the clergy in their Convocations, a right which they angrily affirmed in the first session of the Long Parliament. Here, again, it is probable that the clergy had, at some period which cannot be now defined, attempted to protect themselves against the heavy demands of the king by putting their grants under the sanction of the popular chamber.

The direct taxes of the Plantagenet and Tudor times were percentages on the annual value of lands and tenements, property taxes strictly so called on personal estate, and percentages on ecclesiastical revenues. The first two were granted by the secular, the last by the clerical parliament. Very early in the history of English finance, the district from which the tax was raised was assessed, and the assessment was made a permanent valuation. It seems that this was even done with the tax on personalty. The town, for instance, from which the tax was collected was set down at a fixed sum, and the sum thus fixed was raised *ratably* by the local authorities. Hence in the time of James I. the subsidies and fifteenths, as the direct taxes on real and personal property were called, produced less than they did more than three centuries before, though the money of the Stuart sovereign contained only one third of the specie which was coined in pieces bearing the same name in the 13th century, and prices had risen owing to the increasing cheapness with which silver was obtained. It is likely that the motive for maintaining the same assessment was that parliament might exactly understand the amount of the burden, and the extent of the aid given to the king. The taxing rolls in which the amounts levied are set down exist by thousands in the national archives, and might be made the material for illustrating the social condition and opulence of mediæval England. Similarly the value of benefices was assessed and remained constant, the tax levied being a percentage on the nominal value as entered on the books of the pope or the king.

The tax levied on the clergy was always a higher percentage than that imposed on the laity. It was reasonably argued that a tax on tithes was a lighter burden than a tax on products or annual value, since the tithe-owner had contributed neither in labor nor capital to his share in the produce. Hence Edward I. demanded, in 1296, an enormous percentage—a third—on the revenues of the clergy. The clergy had procured a bull from Boniface VIII., under which they were forbidden to pay taxes to lay persons. That this bull was obtained at their solicitation seems manifest, since the crown was in want of money for carrying on war with Philip the Fair, with whom the pope was at constant feud, and against whom he would be likely to support any enemy. The attitude which Edward instantly assumed towards the clergy, the success which attended his policy, and the serious diminution in their privileges and prestige which followed from the expedient so unluckily adopted, are matters of familiar history. From the time of Edward there are only faint and occasional signs of that clerical independence which had exhibited such vigor in earlier times. During the 15th century the clergy had ceased to be a separate power in the state, though they exercised a great conservative influence in the obscure politics of the Lancastrian and Yorkist period.

Sometimes the king received taxes in kind, especially in wool, the principal export of English produce. It appears that sheep-feeding was almost confined to England, probably because the peace was better kept in England than elsewhere, and destitution was nearly unknown. Hence it was possible to put a heavy export duty on the produce, or, what was the same in effect, to sell it at a much higher price than it was purchased at, by assuming a temporary monopoly of the article. Such an expedient was adopted by Edward I. in 1297, and several times over by Edward III. The importance of English wool to the Flemish manufactures was so great, and the trade was so easily manipulated by the English government, that, from the time of Edward I. till that of Henry VII., *i.e.*, during two centuries, the political sympathies of the Flemish were easily secured on the side of England through the agency of commercial intercourse. When Margaret of Burgundy gave a refuge to the Yorkist exiles, and sent forth pretenders to disturb the throne of Henry Tudor, the negotiation of a commercial treaty with Flanders, the Intercursus Magnus, formed an effectual bar to her intrigues.

The direct taxes of the period before us were doled out sparingly and grudgingly. Sometimes, as in the minority of Richard II., they were appropriated, to use a modern phrase, by the hands of a body of commissioners appointed for the purpose. On the occasion referred to, Sir Richard Whittington was one of the persons selected to see that the moneys granted were duly applied to the war with France. It may also be stated that munitions for the defence of Cherbourg, saltpetre and sulphur, were sold to the Government of this time by Sir William Walworth, well known in history as the slayer of Wat Tyler, the leader of the Kentish insurgents in the peasants' war. It is almost superfluous to say, that supply was granted on the condition that the grievances were redressed. In the early part of the 15th century, when it was seen that the officials of the court evaded the redress of that which the Commons prayed for and paid for, the practice became general of drawing up petitions in the form of bills, and thus of making the redress of grievances the basis of a legislative act.

It is a commonplace with historians to assert that the right of the crown to purveyance, *i.e.*, to provisions and labor, purchased at market rates, or distrained for royal works, was a serious grievance in the Middle Ages. There is no evidence that it was so. The present writer has read many thousands of mediæval accounts, and has rarely found that the forced purchases of the crown were treated as a wrong. Sometimes a great courtier, such as was the younger Despencer in the reign of Edward II., usurped a right which belonged to the crown, and injured the proprietor. But, as a rule, the crown paid its way honestly during the Plantagenet period. It was especially in the reign of the first two Stuarts that the grievance of purveyance was felt. But the discontent was due to the fact that the crown had determined on paying for supplies at the old rates of value which prevailed before the currency was changed and prices had risen. Such a system put on the county, through the justices at quarter sessions, the cost of the difference between nominal and market rates: and the crown, when the supplies were not forthcoming from the county, purchased on its own account, and forced the county to pay extravagant, perhaps factitious, prices for that which it had failed to purvey. An additional cause of discontent was found in the fact that, though purveyance was claimable only while the king was in the district, the Stuart kings demanded the contribution when the court was in London, or at any rate at some distance from the locality which was charged, and often overcharged for default.

In the 14th century a practice of making voluntary gifts to the crown began. Stories are told of Pole and Whittington having made presents or loans to the king, and of the latter having cancelled the king's debts at a banquet which he gave to his sovereign. In the 15th century the voluntary gifts of rich men were modified into a system of begging, under the name of a benevolence. It is probable that the extreme poverty of the crown during the latter years of Henry VI.'s reign, and the growth of partisan spirit among the nobles and gentry of this time, may have led to the practice becoming common. At any rate the custom became general during the twenty-five years of Yorkist ascendency. That it was exceedingly unpopular is shown by an Act of Richard III.'s single parliament, in which benevolences were declared illegal. The successors of the usurper pretended to treat this statute as inoperative since it was enacted during an illegal government. Henry VII. and his successors constantly supplemented their revenues by benevolences. Chancellor Morton's fork, by which parsimonious and expensive opulence were equally invited to aid the king's necessities,—the one out of savings, the other out of expenditure,—is well known. The practice continued down to the eve of the Long Parliament, if indeed it can be said to have ceased, as far as the Royalist party was concerned, before the final collapse of Charles I.'s fortunes at Naseby. It was a commonplace with the courtiers of the day that the king might, if he wished, take the subject's wealth without asking leave. On the other hand, they who refused professed that they were restrained from giving by the anathemas of the Great Charter, by which those were denounced who violated any of the provisions which the Great Charter contained, and notably that by which common assent must be accorded to taxation. Anticipations of revenue by loans were common. The foolish project of Henry III., which was set on foot in order to secure the throne of Sicily for his second son, more accurately in order to enable the pope to crush the reigning members of the house of Swabia, loaded the king with debt, and, forcing him to consult his nobles as to the means of liquidating his obligations, gave an occasion for Simon de Montfort's abortive political and financial reforms. The long wars of Edward III. compelled him to make loans, and ultimately to repudiate his debts; and we are told that his bankruptcy brought down some of the most opulent financial houses in Florence. Henry VIII., who squandered the enormous treasure which his father had accumulated, and afterwards the great personal estates of the church, and finally its lands, —reputed, and perhaps with reason, to have been, in the wealthiest age of its existence, one-third of the fertile land in the kingdom,—constantly incurred large debts, from which he was relieved by his obsequious parliaments. Charles and his son incurred debts which were never paid, and Macaulay does not misstate the case when he says that public debt was not incurred for the first time at the Revolution; what did happen was the satisfaction of the obligation to pay the interest and, if possible, the principal.

One of the financial expedients of the Middle Ages, and indeed of much later times, was a depreciation of the currency by means of issues which, nominally of the same value with an older issue, were intrinsically below it. This is not the place in which one might point out how disastrous and suicidal a policy it is to tamper with the currency, how mischievously the forces of Government are employed when they undertake this kind of fraud, and how enduring are the calamities which result from so great a political crime. Not a little of the stability and progress of England has been due to the fact that dishonesty on the part of Government in dealing falsely with the currency has been a very rare offence,—has, indeed, been committed only within a short but continuous period. The evil, however, which the action caused to England, even for so short a time, was so great that it reduced this country from the position of a first-rate to that of a third-rate power in Europe for more than a century.

At the close of the 13th century, the pound sterling contained what its name imported, a pound weight of silver, of 11·2 fineness,—the penny, which was the commonest coin, containing the 240th part of a pound. Between this period and the first quarter of the 16th century, the penny was reduced to one-third of its ancient weight. But there is reason to believe, from direct and indirect evidence, that it was the practice to pay by weight and not by tale. It is inconceivable that the crown would, for the sake of a temporary gain, have sacrificed the fixed or quit rents, which constituted, after the beginning of the 15th century, the greater part of the revenues raised from crown lands and regalian rights. Besides, the evidence of prices is conclusive as to the alternatives that the value of silver must either have quadrupled in the 15th century, or that payments must have been made by weight, for during three-fourths of the 15th century the prices of the necessaries of life are much lower than they are in the 14th. During the whole of this period, however, the coinage was kept to its customary standard of fineness, and therefore no uncertainty was induced upon pecuniary transactions.

In 1543 Henry VIII. commenced an issue of base coin. At first the alloy was only one-sixth of the silver; but in 1545 a second issue was put into circulation, in which the alloy was one-half, and in 1546 a third issue only contained one-third of silver. Henry died on January 28, 1547. The guardians of his son continued the practice during the first five years of his reign, coining money in 1547 which was only one-third fine, in 1549 of one-half fineness, and in 1551 of only one-fourth fineness. An attempt was made at the conclusion of this reign to issue a coinage of genuine quality, but as the base money continued in circulation, the attempt was futile. Mary was anxious to restore the ancient standard, but found it impossible to do so. Elizabeth called in her father's and brother's base money at a low fixed rate, which gave her a considerable profit, and put into circulation money of the old character and quality. This was effected in 1560, so that England suffered from the evils of a base currency for seventeen years. The effect was disastrous in the highest degree, for it impoverished the nation, and for a long time disabled it from filling that place in Europe which it had occupied for centuries before.

Among the sources of the royal revenue, the ancient customs of tonnage and poundage occupied an inconsiderable place. These were dues levied upon exports and imports, and seem to have been yielded from the earliest times. They are justified on the ground that the sovereign was under the obligation of maintaining the police of the narrow seas. Attempts of a more or less successful kind were made for the purpose of securing this part of the revenue by limiting exports and imports to certain towns, and particularly by fixing the market of exports in particular localities, known as towns of the staple. Thus, for a long time, Calais was by law the sole market of English wool, and the West of England tin was sold at Bodmin and some other Cornish towns. Towards the latter end of the 16th century the growth of foreign trade was rapid and considerable. But the old dues on exports and imports, which had been granted to the crown on the occasion of each accession from the 15th century, were small and inelastic. An attempt was therefore made to revise them, and in 1608 Cecil, James I.'s minister, drew up a new book of rates.

It is well known that these new taxes, for the imposition of which many plausible reasons were alleged, were the commencement of that quarrel between king and parliament which culminated in the civil war. The law courts decided in favor of the crown, and it does not appear that at this time the special scandal of the Stuart government,—the practice, namely, of displacing such judges as gave decisions on points of constitutional law or public justice that were distasteful to the sovereign,—had commenced. But, on the other hand, it was seen clearly enough that, if the crown could, at its own discretion, impose what taxes it pleased on trade, the checks which parliament might impose on the administration would be annihilated. In point of fact, the Book of Rates had very much this effect. Practically there was no parliament between 1610 and 1621, for the parliament of 1611 was dissolved without passing a bill or making a grant. But in the latter part of this period, owing to the skill and energy of Cranfield, the first of English financiers, the king was relieved from his debts, and put in possession of a revenue which was independent of parliamentary supply under ordinary circumstances. The election of 1621 was simply due to the outbreak of the Thirty Years' War, and the disastrous condition to which the king's son-in-law was reduced.

Another expedient by which the crown strove to increase its fiscal receipts was the grant of monopolies. It seems that the creation of a trading company, and the accord of special privileges to those who founded a market in those regions which were opened up to trade by the discovery of the Cape passage and the New World, was deemed to be incontestably the province of the crown. The houses of parliament could not have ventured on criticising the action of a chartered company, much less have pretended to define its privileges. Now the papal see had granted to Spain the whole of the New World, or at least such parts of it as were in any way inviting, and had made a similar grant to Portugal of the district which lay on the road to India. By the death of Cardinal Henry in 1580, the succession of Portugal passed to Philip II., who thus united under one rule the West and the East. But the Dutch were now engaged in the War of Independence, and were assisted by the English, though war had not actually broken out between England and Spain. The war came at last, and the eastern possessions of Spain were obviously the most convenient spot in which the power of Spain might be attacked. There was every reason, then, in according trade privileges to a company which had to contend against the power of Spain, to build forts and factories in which trade could be secured and extended, and to deal discreetly with rivals who were associated with Protestant England by a common European interest, but were sooner or later to come into collision in more distant regions. The massacre of Amboyna was the beginning of those differences which culminated in the wars with Holland during the protectorate and after the monarchy was restored. On December 31, 1600, the first East India Company was created by charter. So far was the revenue from being the better for this charter that the queen granted the company an exemption from customs duties for the first four of their voyages.

From the undisputed power of granting charters for the monopoly of foreign trade there was only a step to the grant of monopolies to the home trade, though of course always on the plea that the monopoly was really a control which it was in the public interest to exercise. It is well known that, when these monopolies caused discontent, Elizabeth graciously cancelled them. They were renewed by James, were again the subject of remonstrance, and were abandoned by the king with so little conciliation that the surrender of the practice gave no great ground for gratitude. The other fiscal expedients which James adopted were the creation of a new title which was conferred by purchase, the sale of peerages, and the rigorous exaction of feudal rights. In the parliament of 1610 an attempt was made to cancel these rights by commuting them for a fixed payment, which, if the scheme had been accepted, would have taken the form of a quit rent on all estates held on military service by tenants of the crown. But the scheme failed, probably as much from a disinclination on the part of the parliament to aid the prerogative by granting the king a fixed revenue, as from any dispute over the amount of the commutation. The whole subject has been ably and judiciously treated by Mr. Gardiner, whose conscientious and painstaking histories of the earlier Stuart period are of the utmost value to the student of finance and politics.

Hitherto, the history of English finance has been that of the process by which the Government attempted, with more or less success, to derive a revenue from direct taxation. Cecil and James I. discovered that a fruitful source of increased revenue was to be found in the customs and a new book of rates, and the Commons as clearly saw that in this fiscal expedient lay the whole issue of the debate between parliamentary control and the royal prerogative. The struggle began with the accession of Charles. The independence and privileges of parliament, the desire to obtain certain guarantees for that kind of church government which represented the dominant feeling of most Englishmen, were the objects of those who constituted the parliamentary opposition to the court; but the machinery by which these results were to be effected was finance. No one can understand the politics of the first fifteen years of Charles I.'s reign who does not detect that the parliament intended to bring the king to terms by stinting the revenue. The struggle began with the first parliament of Charles. The parliamentary leaders imagined that they had won the victory when they secured the Petition of Right. The king interpreted that concession in another way, and was supported by legal advice in the view which he took. During the long interval between the third and fifth parliaments of Charles, the king tried every expedient by which to raise a revenue. Clarendon's statement that the country was peculiarly prosperous between 1629 and 1640 is undoubtedly correct. But the country determined not to let Charles have his way, and the resistance to his financial expedients was only the prelude to those measures which the Long Parliament at once adopted when it met.

During the period which intervened between the dismissal of the third and the summons of the fourth parliament, Charles adopted various fiscal expedients in order to fill up the deficiency of his finances. They were all, except the rates levied on imports and exports, forms of direct taxation. Such were the compositions in lieu of knighthood, the annual payments made by chartered monopolies, the resumption of lands which were said to be encroachments on the royal forests, the fines of the Star Chamber, and in particular the fine of £70,000 imposed on the city of London, and lastly ship-money.

In the earliest times, the maritime towns, and especially the ports in the south-east of England, were liable to be charged with the duty of the national defence at sea. The privileges of the Cinque Ports were connected with this duty of defence, and it appears that the sailors of these ports needed very little persuasion to undertake a duty in which privateering differed little from piracy. Sometimes these irregular forces did good service. The victory of the Cinque Ports over Eustace the Monk in 1216 had even more important results than the battle of Lincoln. The navy of Philip of Valois was annihilated at the battle of Sluys by the same kind of force, and Edward III. was freed from rivalry on sea. In later times the piratical ventures of Hawkins and Drake had royal patronage, and it is said that some of the families who purchased titles from James I.—notably the Riches—had gained their wealth by expedients very similar to those which were familiar to the Algerines, and that their expeditions were as equivocal as those of the Mediterranean pirates. Not a few men who had won their wealth as buccaneers spent a calm and respectable old age in England. There was no hardship felt in the demand occasionally made by the crown, that the seaboard towns and counties must defend the realm at sea.

The first writs of ship-money in 1634 were levied on the maritime counties only. The second and third of 1635 and 1636 were imposed on the inland counties as well, the judges affirming, at first privately, and afterwards, on Hampden's appeal, by a majority, that the crown could levy the tax at its discretion and without the consent of parliament. It seems that the tax yielded about £200,000, though it is said that after the judgment in Hampden's case, the payments were more reluctant and irregular than they were before the judges affirmed the legality of the impost.

The civil war broke out in the autumn of 1642. The king was better off for soldiers, the parliament better off for money, and in the end the possession of adequate funds supplied the means by which the single advantage which the king possessed was neutralized. These were afforded by the new forces which Cromwell drilled effectively and paid highly. Not only was London, always in the interest of Parliament, richer than all the towns in England put together; not only was the eastern district of England untouched by the war; but Norfolk was by far the most wealthy and populous district in England, as Yorkshire and Lancashrire were the poorest and least populous. The resources, therefore, from which the parliament could procure its means were ample and easily obtained.

In 1643 the parliament imposed an excise on beer and ale within all the counties which acknowledged their authority. They also levied a heavy tax on tobacco and wine, and on other articles of consumption. The project was denounced by the king as an act of unheard-of oppression, but was soon imitated in the royalist district by the parliament which sat at Oxford, though, after it had made this grant, it did not meet again. In 1646 the parliament abolished the old feudal dues, turning all tenures into common socage. It is said that between the outbreak of the civil war and the year 1647 the parliament raised more than forty millions in the counties which they governed. Among other expedients, the Protector in 1656 established a general post office. According to the theory advocated by the crown lawyers at the Restoration, that all acts of the parliament from the date of the rupture with the king in the summer of 1642 were void, the old feudal liabilities were revived with the monarchy, and also, by implication, the royal privilege of purveyance. But as the country had been quit of these liabilities for fourteen years, the revival was felt to be an intolerable burden, and by 12 Charles II. cap. 12 they were extinguished. In common justice this emancipation should have been compensated according to the bargain nearly completed in 1610, which was known as "the great contract," by a land tax specially levied on lands which had hitherto been subject to feudal dues, and such an arrangement was proposed. But the cavalier party, now in the ascendant, contrived by a bare majority to carry a measure by which the king obtained the hereditary excise in lieu of his feudal dues, duties being imposed on beer, cider, perry, mead, spirits, coffee, tea, sherbet, and chocolate. Parliament also gave the king the old tonnage and poundage for life.

The excise was an expedient borrowed from the Dutch. In the long War of Independence the people of Holland were constrained to make great loans, and to pledge their revenues to pay interest on these loans. The debt was almost all held in the country, and to meet the charges the Dutch financiers imposed taxes on all articles of consumption, whether necessaries or luxuries, on commercial transactions, on births, marriages, and deaths, on successions and legacies. A Dutchman in the 17th century was taxed from the cradle to the grave, and the expedients of the Dutch financiers formed for a long time a series of precedents from which other countries borrowed largely. In effect Holland was the source of modern finance, and proved how taxation, though apparently of crushing weight, could be easily endured, if it were counterbalanced by industry and thrift. In point of fact, only a few years after the disastrous war with the English Commonwealth (a war waged quite as much for the political reason that the Dutch democracy, always inclined to the House of Orange, which was connected by marriage with the Stuarts, favored the English exiles, and insulted or even murdered the English envoys, as from motives of commercial rivalry), the state of Holland contrived to reduce the interest on its debt of nearly fourteen millions sterling from five to four per cent.

by the threat of paying off the principal. In the same period this state established, for the first time, a genuine sinking fund, by which, principal and interest being paid together, the debt of fourteen millions was to be completely extinguished in twenty-one years. The rate of interest in England at this time was eight per cent.

During the reign of Charles II. the English nation increased greatly in opulence, especially through its foreign trade. But its internal trade and industry suffered severely by the appropriation in 1672 of the goldsmiths' loans. The goldsmiths of London, who during the civil war had undertaken the office of bankers to the London merchants, and took in money at call, or at short notice on rates of interest, had lent these deposits to Charles, in anticipation of revenue, to the amount of more than a million and a quarter, at eight per cent. At the instigation of the Lord High Treasurer Clifford, the king suspended the payment of interest on this loan, for one year only, as he said. But the obligation was never acknowledged, and in 1701, nearly thirty years after the exchequer was shut up, the bankers' debt was treated as a national debt, on which three per cent. interest was to be paid, but which might be redeemed on the payment of a moiety of the principal. It is the oldest portion of the English public debt. In 1720 it became part of the South Sea stock.

Finance became a science in England at the Revolution. The immediate effect of the deposition of James was an alliance between England, Germany, Spain, and Holland, and a declaration of war against France. The war lasted for rather more than eight years, and was concluded by the peace of Ryswick. Now the founders of the English Revolution were determined that for the future the crown should be dependent for its supplies on the pleasure of parliament, and especially that its foreign policy should be held in check by the control of supply. There was the greater reason for this policy at the moment, for it was quite understood that the expulsion of James implied war with France, and that such a war, carried on as it would be by the vigor and determination of William, must be prolonged and costly. In 1688 the revenue was derived from (1) tonnage and poundage, (2) the hereditary excise granted in lieu of the old feudal incidents, (3) the profits of the post office, (4) the hearth money, a house tax, and (5) the grants made in the parliament of 1685 for eight years. The income derived from these sources has been variously computed at two millions to two and a half millions, and the receipts from the excise and customs were steadily increasing. William was under the impression that this great revenue was vested at once in him by the change of the succession,—a view which was supported by several Whig lawyers, who urged that, as long as the late king lived, these duties were payable, but that they were to be enjoyed by his successor. But the political Whigs thought differently. They determined, and they carried without opposition, that a fixed revenue should be settled on the crown during time of peace, that this revenue should be divided into two portions, one for the household and the civil expenditure, the other for the public defence and other analogous charges. It is true that they must have contemplated the immediate contingency of war, and have known that the sum at which they fixed the revenue would be wholly inadequate for the emergencies which would arise; but they were affirming a principle which should be permanent, while the contingency to be dealt with was temporary. It appears that the attitude taken by the parliament gave deep and lasting offence to William, and that the distrust and dislike which marked the relations of crown and parliament during this reign, and prepared the reaction under Anne, had no other origin than the settlement of the revenue by the convention parliament.

The parliament further determined, once for all, to affirm a principle, occasionally acted on in past times, and fundamental to the concession of extraordinary grants, by which all supplies, other than the civil list and the hereditary estate of the crown, should be strictly appropriated to the objects for which they were granted. The demands of the crown in the Middle Ages were generally for public objects, in which the whole community was reputed to be interested, though sometimes, in accordance with the theory of the age, they were acknowledgments for favors received, petitions granted, or pardons allowed. They were therefore ordinarily granted to the exchequer, and no limit was put on the objects for which they were to be expended. But, as we have stated above, appropriations were made in the minority of Richard II. and of Henry VI., in the last year of James I., and pretty frequently after the Restoration, greatly to the disgust of some among the courtiers, who conceived that the prerogative of the crown was dangerously invaded if Charles were disabled from diverting parliamentary grants from special objects to those which the king might be pleased to select. But from the Revolution the Appropriation Act has always denounced severe penalties on any minister of state, or head of department, who converts supply voted from one branch of the service into any other direction. The trial of Lord Melville, in 1806, illustrates the manner in which a parliament, otherwise disposed to trust implicitly in the Government, resented the apparent breach of a fundamental principle in English finance.

The settlement of the revenue on William and Mary left the parliament in the possession of a surplus of £800,000, the difference between the grants made to James and the sums actually settled on the crown. But £200,000 of this was immediately remitted by the abolition of the hearth tax or chimney money. The nation had also incurred a debt to the Dutch of £600,000, which was repaid at once. To meet these charges, a sum of rather more than £400,000 was voted, to be raised by monthly instalments, and as a security for borrowing £370,000 at six per cent. in order to meet immediate requirements. The expedient of anticipating revenue by loans at short dates was very ancient, and is indeed obvious. At first, the Government of the Revolution, feeling its way cautiously, raised loans on short periods, at high rates of interest, and pledged particular taxes for the payment of the principal and interest. These taxes were—new excise duties, *i.e.*, taxes on consumption; a monthly assessment, *i.e.*, a direct tax on income; and a quarterly poll tax, which of course was graduated. A resolution was, moreover, passed by the House of Commons, by which it was proposed to lower the salaries of all officers under the crown to £500 a year maximum, with the exception of certain cases. It took no effect, and was indeed a mere expression of dissatisfaction at the enormous gains of official statesmen. Nothing tended to lower political morality during the latter part of the 17th and the whole of the 18th centuries so much as the enormous perquisites which officials enjoyed.

In 1693 a loan was raised on the basis of a tontine. This expedient was familiar to Italian fiananciers, and was probably suggested by the life loans of the papal Curia. It combined a limited security with the charms of survivorship,—a kind of lottery which is very often found to be attractive, unless, as is generally the case, the tontine is employed as a speculation by those who put selected lives into the loan. Tontines have been employed by English financiers as a means for raising money up to the beginning of the present century. On this occasion, when a million was advanced on the security of additional excises to be levied on beer and ale, interest was paid to all subscribers at the rate of ten per cent. for seven and a half years, after which date £70,000 per annum was to be divided among the survivors, till the number was reduced to seven, when the annuity of each was to revert to the public on his decease. In order to stimulate the operation of this loan, persons were allowed to nominate lives at ten per cent. on the capital invested on each life. Although the latter offer was equivalent to selling annuities at less than half their value, the loan was raised with difficulty. But the capital expedient of 1693 was the imposition of the land tax. Willing as the parliament was to extend the area of indirect taxation, it was impossible that landed estates should be allowed to go untaxed, especially as, within half a century, nearly all taxation had been derived from the contributions of land and property, and as it was remembered that the emancipation of the military tenancies was effected at the expense of the general public. But the Government did not venture on departing from the old principle under which the subsidies were collected, that of making certain local authorities responsible for the assessment, or rather of relieving them of all virtual responsibility. The tax was fixed at four shillings in the pound on the profits of land and personal estate, the latter being taken at six per cent. But from the very beginning the assessment was unequal. It is said that those districts which were favorable to the principles of the Revolution assessed themselves fully and fairly, but that those in which Jacobite views were in the ascendant greatly understated their liabilities. It appears, too, that the assessment of personal estate was soon lost sight of, or rather merged in an aggregate local charge. In point of fact, no revaluation was made. Hence the estimated rental of agricultural estates remained unaltered, and the assessment of the towns, which was also taken as a fixed quantity, was imposed on the owners of property, the capital of the townsfolk and traders being merged in the value of the premises. For example, if the assessment of a town was £1000 in 1693, this sum including both items in the land tax, the same assessment was charged whenever the full land tax was imposed. But the inhabitants of the town had the right of redistributing the fixed assessment on the property contained in the town, as the value of individual holdings was increased or diminished by the outlay of the owners, or the depreciation of the premises. The land taxes, therefore, in the county districts became virtually a secured rent payable to the crown; in the towns it became a tax on improvements, though the amount was not considerable enough to discourage improvement. It was Adam Smith's opinion that in his time there were districts in which the land tax was half what it professed to be, an impost of four shillings in the pound on rents. Since the great increase in the rent of land, owing to the great improvements which have been made in the art of agriculture, the land tax is nowhere heavy, and in some districts is trivial.

Taxes on the rent of land, or on its value as property to be rented, constitute a far larger percentage in the budget of foreign countries than they do in England. In the reign of William and Mary it is true that the land tax, where it was fairly assessed, was a very considerable impost, and the country gentlemen easily fell in with the pacific projects of Walpole, when he coupled them with the fact of a reduced land tax, and a prospect that the tax would be abrogated altogether. But as, owing to the increasing value of land, and the growth of the system of indirect taxation (the principal expedient of English financiers during the 18th and the first half of the 19th century), the land tax became absolutely and relatively a decreasing charge, taxes on the rent of land ceased to be an important element in the national budget. Adam Smith informs us that in Prussia the land tax on secular estates was from 20 to 25 per cent. of the revenue, on ecclesiastical 40 to 45. In some European countries lands held by a noble tenure were taxed at a slightly higher rate than those held by a base tenure. In France, on the other hand, lands held by a noble tenure and the lands of the clergy were exempt from land tax, while the burden of direct taxation fell exclusively on those held by a base tenure. The inequality of this system, its injury to the revenue, and the still greater wrong which it inflicted on those who were liable to the tax, were constantly commented on by those French writers who made finance their study, and particularly by the Economists, whose particular views on the nature of taxation were an exaggeration of what contained a serious and important truth. But the interests which profited by the inequality were too strong for any reform. They were at last sacrificed by a revolution, much of the bitterness and ferocity which accompanied the change having been unquestionably due to the sense of injustice felt at the extreme unfairness of the feudal taille.

The next expedient was that of borrowing money on lotteries. There are instances of state lotteries before the Revolution. One was drawn in 1568, with the object of improving the harbors; another was held in 1612 and subsequent years, for the benefit of the Virginian colonists. But the parliament of 1620 presented these lotteries as a grievance, and they were discontinued by an order in council. In these later lotteries the Government found it impossible to dispose of the tickets except by granting at the same time annuities at exorbitant rates of interest. In course of time, when the English people became more inclined to speculation, lotteries became a profitable means of raising money, though they had such disastrous effects on public morality that they were ultimately discontinued. In the year 1693 loans were raised on the security of stamp duties, now introduced for the first time, and on the tonnage of ships. The charter of the Bank of England was granted at the same time in exchange for a loan of £1,200,000, the security of the loan being generally the assignment of one half the additional excise duties. These duties were now imposed without any limit of time. Hitherto indirect taxes had been granted for fixed periods. The negotiations which led to the foundation of the Bank of England contemplated a permanent debt and a permanent fund from which the interest of the debt was to be paid.

The relations of the Bank of England to the finance of the country are as important as the effects which it had upon trade,—in the early part of its career were far more important, for the private bankers were already fulfilling many of the functions of commercial banking. But the Bank of England was from the first the banker of the Government, managing its revenue,—for which it received on its foundation £4000 a year,—anticipating its revenues, putting its securities into circulation, and assisting its credit at emergencies. It was, in point of fact, from the beginning a great department of state, and so obvious and, to the public opinion of the time, so dangerous were its powers, that provision was taken in the Act by which it was constituted, that if it advanced to the Government any moneys on the credit of the public revenue without the authority of parliament, it should forfeit treble the sum which it had so advanced. Moreover, the Bank of England, by virtue of its financial power, became a great political institution, existing by and for the principles of the Revolution; and to it much more than to the public debt may be applied the statement of Bolingbroke that, while the taxes necessary for the expenditure of the eight years' war might have been met by taxation within the year, the Government of the Revolution preferred to incur debt, because the holders of the public securities were thereby interested in the maintenance of the new settlement.

A singular tax was imposed in the year 1694, that on marriages, births, and burials, on bachelors and widowers. These taxes were graduated, rising from four shillings on the burial of the humblest person to £50 in the case of a duke or duchess. The duty on births ranged from two shillings to £30, on marriages from two and sixpence to £50, on bachelors and widowers from a shilling a year to £12, 10s. In the same year taxes were imposed on glass, stone and earthenware, coals and culm. In the next year the currency was reformed, the Government conceiving it expedient that the cost of restoring the clipped and hammered money should be borne by the nation.

During the period in which the old money was being called in, and the new coinage struck and issued, the country was in the direst distress. But the fertile genius of Montagu, now chancellor of the exchequer, invented exchequer bills. Long ago, exchequer tallies, *i. e.*, certificates of indebtedness on the part of the exchequer, had been in circulation, or at any rate been negotiated. But the first exchequer bills—these did not bear interest—were virtually a Government paper based on the security of the revenue, and intended to be a temporary substitute for the currency, now deficient, but in course of restoration and extension. They came at a critical time, and supplied an urgent want. Thus they were an immediate success. They helped to sustain mercantile credit, they lightened the burden of pressing charges on the revenue, they supplemented the weakness of the currency, and they thenceforward formed part of the machinery of English finance. The second issue of exchequer bills bore interest at 5d. per cent. per diem, *i.e.*, a little over 7½ per cent. per annum. These instruments of credit were put into circulation in amounts from £5 upwards. Exchequer bills survived a risk which has been fatal to similar instruments, for in 1698 it was discovered that an extensive forgery of them had been perpetrated, for which some few persons were punished, though the greater criminals escaped. In 1696 the malt tax was first imposed. During the reign of William the whole amount of receipts for revenue was a little over 72 millions, *i. e.*, rather more than 5½ millions annually. Of this amount, about 34½ millions were obtained by indirect taxation, about 21¾ millions by direct taxation, 2½ millions from the post office and the hearth money, and nearly 13½ millions remained as debt. The expenditure was about 45 millions on the public service, nearly 9 millions on the civil list, and rather more than 18 millions on various objects, including repayment of debt.

In forty years, then, the English financiers had found out how elastic and fertile indirect taxation is. We shall see in the course of a century and a half how they used their discovery, and improved on it. Hitherto most of the indirect taxes had been imposed temporarily; the policy on which the country was about to enter necessitated their perpetual imposition. Thus, for example, the malt tax, having been a temporary tax in the eight years' war, was revived and made a permanent tax at the beginning of the war of the Spanish succession. The principal sources, however, of the extraordinary revenue needed for this war were customs and excise, land taxes, stamps, and similar duties, and loans. The amount of debt contracted during the period was a little in excess over that obtained by the land tax, the land tax being less than two-thirds of that obtained by indirect taxation. The form in which the loans were raised was annuities on lives or on terms of years, granted on disadvantageous conditions, lotteries, and the funding of floating debt. The latter operation was in part undertaken by the Bank of England, which thus considerably enlarged its capital. The rate of interest was about 6 per cent., and it appears that the form in which the loans were contracted was the best method after all in which the Government could borrow.

A still larger operation was attempted by Harley in 1710. A new company was formed, which was to take the unfunded debt, amounting to more than 19 millions, to receive 6 per cent. on the sum, with £8000 a year for expenses of management, and in consideration of having performed this financial operation for the Government, was to be invested with the sole privilege of trading to the South Seas. This was the origin of that famous company which ten years afterwards obtained so scandalous a notoriety. In 1715 the aggregate fund was established. Numerous taxes had been made perpetual, and the Act creating this fund directed that the proceeds of these taxes, with the surplus of other revenues, and all other public money, should be brought into the exchequer as a collective quantity. But by this time the whole revenue of the country, with the exception of the annual land and malt taxes, had been pledged to the various loans contracted during the two wars which followed on the Revolution. An attempt was made to lighten the burden of the debt in another direction of finance, *i.e.* by diminishing the rate of interest.

Shortly after the peace of Utrecht the rate of interest began to fall, and continued to decline till it became possible to make use of the fact for the purpose of effecting a considerable reduction in the annual charge of the debt. An attempt was therefore made in 1717 to obtain a small loan at 4 per cent. The project was premature as yet; only a trifling sum was subscribed, and at last it became necessary to raise the rate to 5 per cent. But in order to consolidate parliamentary credit, the Government of the day created three new funds in addition to the aggregate fund of 1715. These are called the South Sea fund, the general fund, and the sinking fund. The aggregate fund was the guarantee under which the Bank of England consented to accept 5 instead of 6 per cent. on their capital, and to circulate exchequer bills at a very low rate of interest. The South Sea fund was the security afforded by the perpetual duties appropriated to the South Sea Company at the foundation of that corporation, the interest in this case being reduced also from 6 to 5 per cent. In order to pay off such public creditors as were unwilling to submit to the reduction, the two companies agreed to advance 4½ millions at 5 per cent., and certain taxes granted heretofore for terms of years were now made perpetual, under the name of the general fund. By these financial operations a saving of more than £300,000 a year was effected. The sinking fund consisted of the surpluses derived from the several other funds, which were to be employed for the extinction of debt, and for no other purpose whatever. The policy of these arrangements, particularly the latter, was soon approved by a considerable rise in the value of stocks. Thus, for example, South Sea stock, which was worth 100¾ at Ladyday, rose by Michaelmas to 111½. In the same year, too, the first vote of credit was taken, in expectation of a threatened invasion by Charles XII. of Sweden. The vote was indeed strongly resisted, and as the majority by which it passed was very slender, Townsend, Walpole, Methuen, and Pulteney were put out of office or resigned. In 1719, the surplus of the three funds referred to above, amounting to over £400,000, was applied to the reduction of debt.

In 1720, the celebrated South Sea scheme was projected. It gives some color to the opinion of those who hold that commercial and financial follies are epidemic, that a scheme far more disastrous in its effects than the South Sea bubble was put into shape the year before in France, when Law floated the Mississippi Company. In the month of November, 1719, the nominal value of the stock of the French company was 18,000 millions sterling, a sum which the statists of the age reckoned at 180 times more than all the currencies of Europe put together. Both projects were trading companies, and in both companies the grant of trade privileges was made the occasion for negotiating terms with the public creditor through the agency of the company. The immediate object of the negotiations entered into with the South Sea Company was the reduction of what were called the irredeemable annuities, created for long terms of years during the wars of William III. and Anne. It is probable that the proposals of the company would have been, to judge from the success with which the conversion of the various stocks in 1710, was effected, financially satisfactory. But unluckily the other great financial corporation, the Bank of England, bid against the South Sea Company, and in this rivalry the latter offered terms, which were finally accepted, under which the company contemplated the purchase of the whole national debt, to be represented by a total capital of 43½ millions, for which they were to receive interest at 5 per cent. The magnitude of the operation, the difficulty sure to arise when attempts were made to obtain *bona fide* subscriptions for the large amount which would be required in order to complete the bargain, and the reaction certain to ensue as soon as ever a check was given to the operation, were lost sight of. It was not perhaps so remarkable, when it is mentioned that the very manner of the negotiation between the company and the Government pushed up the price of the original stock much beyond its natural value, a rise which the directors of the company were not slow to take advantage of, and that the stocks of other companies which could offer no exceptional prospects of profit were raised to nearly as absurd a price as that of the South Sea. The directors of the company took advantage of the fictitious price which the stock had reached, and created shares at or near the market value of their stock. As the fever of speculation reached its height, the directors exalted the price of their shares, and it seems even contemplated an issue of stock at the price of ten times its nominal amount. By midsummer the advanced prices of all public stocks are said to have reached a market value of 500 millions. Before the books of the company closed on June 22, the directors had negotiated for all the irredeemable debts of the Government. On August 12th they dealt with the redeemable debts, amounting to nearly 14½ millions, at the price of 800. When parliament met in December, the price of South Sea stocks had fallen to 200. In the interval, however, the directors declared a dividend of 30 per cent. at Christmas, and pledged themselves to a dividend of 50 per cent. for the next twelve years. This might perhaps have been possible had the subscribers made good their payments, had the directors been able to place all their stock at the nominal prices, and if all their loans were repaid. But the payment would only have been temporary, and both principal and finally interest would have speedily been lost to the shareholders.

The issue to the nation was that the South Sea stock was fixed at nearly 34 millions; that this was divided into moieties, one-half to be the trading stock of the company, the other to be a fund stock on which dividends should be paid; and that the rate of interest payable by the Government on the whole should be 5 per cent, till June 2, 1727, when it should be reduced to 4 per cent. The nation suffered considerable temporary loss, for the capital of the debt, instead of being reduced, was increased by three millions, and the temporary annuities were converted into a perpetual stock. But, on the other hand, the state secured a reduction of interest within six years, and could, if the state of the money market proved favorable, reduce their rate of interest at an earlier date, or if the revenue exceeded the expenditure, could bring the machinery of the sinking-fund into operation. In 1727 three-fifths of the public debt was South Sea stock. In 1724 the rate of interest had fallen so much that the bank, on a revision of its bargain with the Government, agreed to accept 4 per cent. instead of 5 on its new stock, the old rate of 6 per cent. remaining on its original stock.

In 1726 it was found possible to borrow at 3 per cent., and a small stock was raised at this rate. In 1727 the land tax, which had been at two shillings for five years, was raised to four. Those customs and excise duties which had now been made permanent, and were reckoned on an average at 30 per cent. of the value of duty-paying and excisable articles, now yielded, with the malt tax, about four and a half millions, or twice as much as the land tax at four shillings in the pound. In 1732–3 the land tax was reduced to a shilling in the pound in order to conciliate the landed interest, the salt taxes were reimposed, and the deficiencies of the revenue were made up from the receipts of the sinking fund, which now amounted to more than a million annually, and by which reductions were made from time to time in the public debt to the amount of more than six millions in the twelve years between 1727 and 1739. As Walpole had been designated the father of the sinking fund, his policy was severely, perhaps sincerely, criticised by the opposition. But while it was certain that the ministers could count on a great majority for the financial scheme which he proposed, it was not equally certain that he could reckon on support except by reducing the land tax, an impost which was sensibly felt by the landowners, and was correspondingly distasteful. The land tax remained at two shillings in the pound from 1733 to 1739. In other words, direct taxation remained odious, and indirect taxation became familiar.

In 1737 the rate of interest on public securities was less than 3 per cent., for the 3 per cent. stocks were worth 107 in June. This is at about the middle of that remarkable series of years in which the prices of grain were singularly low, a set of facts which is characteristic also of the first half of the 15th century. The cheapness was undoubtedly due in great measure to a succession of abundant harvests, and to the rapid growth of agricultural skill. But it is also to be ascribed in some degree to the increasing dearness of the precious metals, especially silver, and it is likely, for economical reasons which would not be in place to allege here, that a period in which the precious metals are dear will be accompanied by persistently low rates of interest. It is manifest that at the present time, gold is rapidly increasing in value, and that a low rate of interest has accompanied this fact, as it will in all likelihood continue. The House of Commons resolved, in view of the high prices to which public securities had risen, that the rate of interest on all Government stocks which were redeemable should be reduced to 3 per cent. A bill was brought forward embodying this resolution, and was read twice, but lost in the course of the session. It appears that the plan was frustrated in deference to the moneyed interest. That it caused some alarm to the holders of redeemable stocks is proved by the fact that, when the three per cents. stood at £105, 3s. 8d., the four per cents. were at £113 only.

There is one incident in the history of Walpole's financial projects which must be referred to. In 1733 this minister brought forward his famous excise scheme. The payment of customs duties by the importers was obligatory on the landing of such articles as were liable to the tax, or the importer, if he desired delay, was compelled to enter into a bond with sufficient securities for the payment of the impost. The inconveniences of the system were obvious. If the importer were in narrow circumstances, he was frequently obliged to realize the value of his goods by immediate sales, when the market price was low already, and was thus deprived of one advantage which is characteristic of capital, that it enables the possessor of it to wait for favorable markets. It inflicted the maximum loss on the consumer, to whom the tax was of course transferred, and a minimum advantage to the Government; for of course the trader's profit was derived from capital advanced for payment of duty, estimated by the time intervening between the importation and the sale. It tended towards limiting competition in foreign products, for the wealthier merchants had nearly a monopoly of sale in articles on which considerable customs duties were charged, owing to the necessity of finding the tax at once. A further assistance was given to such merchants by the rule under which the importer who paid his tax promptly was allowed a bonus of 10 per cent. on the amount of the tax. It opened the way for frauds on the revenue, for it encouraged smuggling, and assisted the dishonest exporter of foreign produce in obtaining a fraudulent drawback. It checked the carrying trade, narrowed consumption, and impaired the revenue.

The reform which Walpole contemplated was to extend to foreign products imported into Great Britain that system which was already practised with such articles as were liable to the internal duties of excise, *i. e.*, to permit the storage of foreign goods in bonded warehouses on the payment of a trifling landing duty. Thus, tobacco—the experiment was to be tried with tobacco and wine at first—was liable to 6⅓d. per pound. Walpole proposed to reduce the tax to 4¾d., to levy ¾d. on importation and deposit in the warehouse, the import duty being payable as part of the hereditary excise, but being repaid on exportation, and to delay the payment of the 4d. till such time as the owner of the goods might wish to dispose of it to the dealer for home consumption. In this way Walpole contemplated that a great ease would be afforded to the fair trader, and that frauds on the revenue—an invariable source of loss to the honest merchant—would be obviated. It is clear that Walpole anticipated that the revenue would gain all from the check to smuggling and factitious drawbacks which it lost in reducing the duty.

It was unfortunate for Walpole's project that he brought it forward at a time when he had, in deference to the clamor of the landed interest, reduced the land tax to a shilling in the pound, and suspended the operation of the sinking fund. It is true that the plan was not wrecked on these issues, though they must have been present to the minds of many among those who resisted it. It was in vain that Walpole most accurately predicted, as the result of his reform, "that it would make London a free port, and by consequence the market of the world." The great merchants, who had a monopoly of importation; the smugglers, who, in that age of corruption, found means to make themselves a parliamentary power; the public, which loathed the excise as an inquisitorial system, begun in the old days of Cromwell's military usurpation, continued in order to sustain the foreign policy which the Government of the Revolution had prosecuted, and extended in order to enrich foreign favorites and to bribe the servants of the state; and the patriots, as the opposition called themselves, eager to use every chance against Walpole, even when he was in the right, because they had so pertinaciously asserted that he was always in the wrong,—united to defeat the project. Walpole's life was threatened in the streets, and, what he feared more, his majority was imperilled in the House. The warehousing scheme was abandoned, and not revived till 1803. The elder Pitt, when, being in the ascendant, he could afford to criticise his own conduct, said that he regretted nothing so much as his opposition to Walpole's excise. It is singular that the principal works on commerce and finance which were published before the adoption of the bonded warehouses system pass over Walpole's plan in silence.

The public debt was increased between 1739 and 1748, the date of the peace of Aix-la-Chapelle, by about 28 millions, the interest on this sum being principally provided by duties on spirits, though during the whole period the land tax was put at 4s. In 1750 it was reduced to 3s. But the old customs and excises were continued and increased. In 1731 a duty of 20s. a gallon had been imposed on gin, with a view to checking its use. It is well known that this prohibitory duty led to extensive smuggling, and to illicit distillation on a large scale. Hence, in 1743, when the Government was on the look-out for means, it was proposed to repeal the Act of 1731, and impose remunerative duties in the place of the prohibitive tax. The proposal was resisted on grounds of health and morals, but was carried.

Early in 1750 the plan suggested in Walpole's time of reducing the rate of interest on public securities, with the option of receiving the principal, was revived, as the three per cents. had been above par in the autumn of 1746. The amount to be treated in this way was nearly 58 millions. The holders of the stock were offered 4 per cent. for 1750, 3½ till the end of 1757, and 3 afterwards. In the course of the year the terms were, except for about 3¼ millions, agreed to. In the next year the consolidated stock was first formed by merging nine separate loans into a common 3 per cent. fund, and subsequently other stocks were consolidated in the same manner. The project was not only highly successful, but the new three per cents. rose in June of the same year to 106½. In 1753–4 the land tax was reduced to 2s. In 1755, when the Seven Years' War was imminent, the land tax was raised to 4s., at which sum it continued, except in 1767, 1768, 1769, 1770, 1772, 1773, 1774, 1775, till 1798, when, being made perpetual, the ceremony of its being granted annually was abandoned. During the Seven Years' War and onwards, it became the practice of English financiers to invite loans upon one of three principles. They either offered such a variable sum of three per cent. annuities as represented the difference between the value of this security and the same amount actually lent, as, for example, £120 stock for £100 borrowed; or a fixed amount of stock for a variable percentage, as £100 stock for (say) £80 lent; or gave £100 stock, and a variable sum in long or life annuities, as (say) £100 stock and 22s. 6d. per cent. per £100 subscribed for ninety-nine years. The loans raised during the Seven Years' War were far in excess of any that had been negotiated before. That, for instance, of 1760 was twelve millions, and the same sum was raised in the next year. When the peace of Paris was signed in February, 1763, the nominal capital of the English funded debt was in amount nearly double that which had been incurred up to the treaty of Aix-la-Chapelle.

The loser in the Seven Years' War was France. It was prostrated, was stripped of its colonies, and wholly impoverished. No war in the world's history had such important results on the remote future as this has had. From this time France ceased to be a colonizing nation, and England occupied its place, as well as extended the settlements which it had already founded. At the beginning of the Seven Years' War, France was the determined rival of England in the East, and had occupied the south and north of the English plantations in the West. At the conclusion of the Seven Years' War, it had lost both its colonial centres. By this loss it was also deprived of one among those outlets for discontent which have been so serviceable to the Governments of Western Europe. Emigration does not relieve a country of its population so much as it does of its dissatisfied and disaffected members. The destruction of French colonial enterprise had no little indirect effect on the passions of the Revolution. The supremacy of England in the northern part of the New World led the Protestant inhabitants of Ireland, bowed down and impoverished by the oppressive revenue laws of England, to emigrate westwards, and so give at home an opportunity for the Irish Catholics to reassert themselves, and for the Americans to strengthen or recruit themselves in the War of Independence. Again, the charges of the Seven Years' War were so great that the British parliament tried to help itself by taxing the colonies; the colonies met this project, after various acts of resistance, by the Declaration of Independence; the war of American independence found an ally in France, which was eager to blot out the memories of the Seven Years' War; the reaction of republican America on monarchical France aided those theories which developed the French Revolution. On the Revolution followed the Empire; the Empire induced the reaction of the Holy Alliance; from this came the western rising of 1830, the general rising of 1848, and ultimately the doctrine of modern European politics, that, namely, of the nationalities.

We are concerned, however, with the financial consequences of the Seven Years' War. It was in no slight degree provoked by the hostility of the French and English settlers in America, and it had been carried on at an enormous expense. The result was to secure the ascendency of the English race on the American continent. It appeared to deserve the gratitude and the sacrifices of the colonists. There is little doubt that the inhabitants of the plantations would have recognized these facts, and have responded according to their means to an appeal made to them by the ministry. In an evil hour the ministry attempted to impose taxes on them by the authority of the English parliament. No one, not even the colonists themselves, doubted that the English parliament could enact laws for the colonies, could regulate their trade, could dictate the course of their industry, and thus as effectually bring them within the financial arrangements of the British empire as though it collected a revenue from them. In fact the colonial system was really a department of finance, though its details were defended on those mercantile principles which Adam Smith expounded and refuted. The imposition of the Stamp Act was resented on political principles, and was resented successfully. Passed in 1765, it was repealed in 1766, though at the same time the House of Commons passed an Act asserting, in the broadest manner, the right of the English parliament to tax its dependencies. The Americans answered by refusing to consume British goods. As is well known, the ultimate cause of the revolt of the colonies was the despatch of the East India Company's tea ships to Boston, the tax on tea imposed on the colonists being nominally retained in order to serve the interests of the company, whose finances were seriously affected at the time, but really in order to affirm the right, on which king, ministry, and parliament insisted, of taxing the colonies through the machinery of the English House of Commons.

From the outbreak of the War of American Independence the land tax was annually granted at 4s. in the pound, though of course on the old assessment. It formed the basis on which an annual issue of two millions in exchequer bills was made. But the residue of the means from which the interest on the annual increment of debt was payable was derived from taxes on consumption and stamps, *i.e.*, from indirect sources. The actual debt created during the American war was nearly 97½ millions. The sum received from loans was 75½ millions, and the annual sum needed for the interest on this debt was a little over 4 millions. In 1786 Pitt, after inviting the attention of parliament to the magnitude of the debt, and the necessity for reducing it, proposed to revive and make permanent the machinery of a sinking fund. The minister had taken counsel with Dr. Price, who for some years previously had been lamenting the downfall of Walpole's sinking fund, and urging that by borrowing at simple interest great accumulations might be formed at compound interest, and that thereby the debt would be ultimately extinguished. Pitt's proposal was that the exchequer should pay a million annually in quarterly instalments to six eminent persons, who should invest the sum in the purchase of stock, and that this payment should have precedence over any other issues of the exchequer, except the interest on the debt. He intended that the interest on this fund should accumulate with the annual receipts, and he calculated that in twenty-eight years the fund, with accumulated interest, would yield an annual surplus of four millions. When this sum was reached, the interest was to be at the disposal of parliament.

An amendment was proposed on Pitt's proposal by Fox, to the effect that when at any future time a loan was proposed, say of six millions, the commissioners, if they had sufficient funds at their disposal, might purchase a sixth of the stock. It was accepted by Pitt, and formed the process by which, during the great Continental war, the commissioners of the sinking fund continued to lend their balances and the annual sum which they received from the Government to the State, thus piling up an imaginary obligation of the nation to itself, which seemed to extinguish public debt, but which would certainly be treated as a fiction, as indeed came to be the case, when the great war was over. The efficiency of the sinking fund consisted entirely in the extent to which, by requiring an income which should be in excess of expenditure, it necessarily diminished debt. Its delusiveness arose from the fact that the actual funds which it had accumulated were actually invaded under the pressure of war-taxation and expenditure, and that its nominal continuance was accompanied by the creation of a fictitious loan, the process of which was burdened by the expenses of an office. Other schemes were adopted subsequently, more or less similar to the old sinking funds, in later times, to which we shall allude presently.

For a short time before 1793, when England began her longest and costliest war, the English funds rose greatly in value, chiefly, it is said, because they were conceived to be the safest investment which could be found for those who were flying from the Continent in dread of actual or prospective violence. But immediately on the outbreak of hostilities with France the country was put to the severest straits. In the year 1793 a serious commercial panic occurred, accompanied with an unparalleled number of bankruptcies. Loans of enormous amounts were raised as the war went on; the current expenses of Government were met by credits on the bank; and at last, on February 27, 1797, the Privy Council ordered the Bank of England to suspend cash payments. For twenty-three years afterwards the suspension was continued.

Up to 1796 the additional burdens which were imposed to meet the interest on loans and to defray some of the annual charges of the war were raised almost entirely from indirect taxation on consumption, sometimes on production, but not on property. But in this year Pitt proposed to levy duties on the succession to real and personal estate. Knowing that his budget would meet with hostile criticism, he determined to divide his bill, and impose the projected tax on real and personal estate by separate enactments. The tax on personalty was accepted with very little remonstrance, though a few solid objections were urged against the measure. But the country party strongly resented the proposed tax on real estate. They absented themselves from the House, and nearly left Pitt in a minority. The minister felt that he must give way to them, and postponed his bill for granting duties on realty in succession for three months, thus virtually abandoning the project. The discrepancy, therefore, between the liabilities of real and personal estate, when they become the subject of devise or succession, has never been remedied. It is true that an attempt was made by Lord Lauderdale to suspend the operation of the Act which had been passed, till such time as the anomaly might be rectified. But he was ruled to be out of order, on the ground that no bill after it has been passed can be repealed or modified in the same session. Like many similar Acts, the legacy duty was tentative, and the rates of tax were progressively raised according to the proximity of blood in which the legatee or heir stood to the testator or ancestor. In order to compel the making of wills, and to obviate the risk that persons might avoid a testamentary disposition with a view to escape the legacy duties, exceptional probate duty was imposed on those estates which were administered without a will.

Apart from the manifest inequality of a tax which omitted to charge succession duty upon real estate, especially at a time in which the value of such estate was rapidly rising, objections were alleged against the tax on the ground that it was likely to inflict inconvenience or injury in the case of persons engaged in trade by the compulsory exposure of their circumstances, and because it was sure to breed discontent. More subtle was the objection taken by Lord Lauderdale, and afterwards by Mr. Ricardo, on the ground that it was a tax on capital, and therefore injurious to the development of wealth. The answer to this objection is, however, simple. It is impossible for a Government to tax that which cannot be saved, but must be consumed in order that industry may be continuous. Now that which may be saved is either consumed in superfluities, and therefore may be made the subject of direct or indirect taxation, as the case may be, or is saved and employed as capital, or accumulated as reserve. In other words, not only is it not true that capital should not be taxed, but it is true that nothing but that which is or may be capital can be taxed.

More valid than this objection to legacy duties is that which can be alleged from the fact that, under existing circumstances, it is easy for the wealthy to evade the tax by a *donatio inter vivos*. The attempt to evade duties or liabilities on successions is a very old practice in England. One of the earliest, after the Great Charter perhaps the earliest, written law in English history, the Statute of Marlebridge, is intended to defeat attempts to evade feudal dues by such donations. There can be no doubt that similar practices prevail at present. Nor can they be prevented until voluntary gifts and transfers are registered, published, and rendered traceable at last to the officers of the revenue, who might have powers to visit with penalties in addition to ordinary duties all conveyances and transfers made at such a date previous to the death of the donor as would indicate that the gift could reasonably be interpreted to imply an intention of evading legacy duty. But at the same time it cannot be stated too often that, first, it is not always the best system of taxation which must be adopted, but the best possible system, since communities require to be habituated to a new tax; and, next, that any unfairness in the imposition of taxation is sure to suggest evasion. A financier must be just, if he wishes the taxpayer to be honest. There are three offences against the revenue, looked on as very differently culpable, but all stimulated by financial error or injustice. The first is that just alluded to, a gift of property during the life of the donor with a view to evade the legacy duties. This fraud is thought scarcely culpable, though it will be obvious that it is much more easy for the wealthy to practise it than for those who are in narrow or moderate circumstances. The second is the evasion of the charges imposed on earnings by the so-called property tax, but which is of course no property tax at all, since large masses of property are exempted from its operation, and incomes which are in no sense property are taxed at the same rate as those which issue from property. The third, now considered as merely vulgar larceny, is smuggling. A generation ago public sympathy was strongly with the smuggler. The change in this opinion is intelligible and instructive. The greater part of English taxation of an indirect kind was imposed for political purposes, or to serve private interests, up to the time when Sir Robert Peel, nearly forty years ago, began seriously to reform the tariff. In course of time, he and those who succeeded to his policy have adopted and carried out the principles that protection must be abandoned, that finance must not be manipulated in order to suit political antipathies, and that taxation must be imposed for revenue purposes only. The progress of these principles has extinguished the trade of the smuggler. For a long time even economists argued that the smuggler was the practical critic of a vicious system of finance. It may be predicted with some confidence that, when a just property tax is imposed instead of an unfair income tax, public opinion will enforce a morality which it does not require at present, and will assist the Government in enforcing that morality by penalties and by compulsory publicity; and that similarly when real estate is made liable to the same duties as are imposed on personalty, the disposition to evade the duties will be checked, and that machinery of Government which detects and chastises fraud will be strengthened and enforced.

The disasters which followed on the outbreak of the great Continental war, the enormous cost at which the war was carried on, and the demand for money in order to meet current charges, produced serious effects on the currency. A considerable exaltation took place in the value of gold, and as gold had become the chief currency of England, its exportation was under the circumstances inevitable. In 1794 the Bank of England possessed in cash and bullion over 8 millions. In February, 1797, the stock of treasure had sunk to 1½ millions. The Government had overdrawn its account with the Bank on February 25, 1797, to the amount of nearly 10 millions, and was demanding further advances. It is true that no real alarm was felt for the ultimate solvency of the Bank, but considerable and just alarm was entertained as to the convertibility of the notes. Hence the Government, on February 27, 1797, ordered the Bank of England to suspend cash payments, and shortly afterwards authorized the issue of notes below five pounds.

In November, 1797, Mr. Pitt introduced what he called a new and solid system of finance. The scheme was afterwards explained to consist in a triple assessment, *i. e.*, a trebling of all the assessed taxes imposed on individuals, with a limitation, however, that such a tax should not exceed the tenth of the taxpayer's income. It was estimated that this tax would yield 7 millions, but the result was disappointing. From the first it was exceedingly unpopular. It was felt to be unequal, and to press with peculiar severity on those whose avocations constrained them to contribute to those assessments which the Government imposed, and perhaps necessarily, without much consideration for those who had to pay them. At the same time the poor escaped the tax, for according to Pitt's budget speech, the assessed taxes were leviable on between 700,000 and 800,000 householders, and yielded £2,700,000, though the contributions of 400,000 of these householders did not amount to more than £150,000.

The triple assessment lasted only a year. It was probably intended only to be preparatory for the income tax, which was imposed in 1798. Indeed, if the expenditure of the war was to be met by any other resource than loans, it was necessary to discover some tax which should reach all classes who could be made to contribute to the necessities of the exchequer. Now it was plain that, had the assessed taxes been ever so productive,—the amount actually received from them was only two-thirds of their estimated yield,—they are more or less optional in character, and could therefore be evaded. The income tax, according to Lord Stanhope, had often been urged on Pitt, and especially by Bishop Watson. It began as a graduated percentage. If the income of the taxpayer was between £60 and £65 a year—it was not imposed on those rated below that sum

—the tax was to be a 120th part of the income, and the proportion gradually rose to a 10 per cent. tax on incomes of £200 and upwards. Pitt estimated the produce of the tax at 10 millions; it actually yielded only 7. It was imposed as a war tax, to cease at a declaration of peace. But Pitt immediately pledged it to a loan, and in 1801 3 millions of its annual produce was thus appropriated to irredeemable debt. The remission of the tax then rendered it necessary that new taxes should be imposed, and such was the course actually adopted after the short-lived peace of Amiens.

The income tax was criticised by Lord Holland on grounds very familiar to us in the later times, namely, that it visited incomes "derived from permanent and disposable capital, those arising from precarious and temporary possessions, and those from labor, talents, and industry at the same rate, and was therefore unjust, unequal, and impolitic." It was also argued that the term property tax was a misnomer,—that property was often not visited by the tax at all, and that what was not property was mulcted. It was alleged that to require the disclosure of one's circumstances was contrary to the prejudices and customs of Englishmen, was unconstitutional, and a serious injury to commerce and trade, since merchants, it was alleged, would often find it convenient to sacrifice more than a tenth of their income rather than permit the publication of their affairs, and, lastly, that it was a violation of public faith with the stockholder, whose dividends were mulcted, by the intervention of that very Government which was pledged to pay him an irredeemable annuity, of one tenth of his just due. But no objection seems to have been alleged, on the one hand, against the graduated character of the tax, nor, on the other, against the low limit on which the full amount was exacted.

At the remission of the income tax imposts to the amount of 38½ millions a year were paid, this sum being double the amount raised in 1793. With the exception of the perpetual land tax, a little over 2 millions, and every year becoming more disproportionate to the rising value of land, almost the whole of this amount was raised on consumption, *i. e.*, from indirect sources. Rents rose rapidly, under the joint operation of high prices and deficient crops. Profits increased, owing partly to the legitimate growth of manufacturing industry,—for the inventions of Hargreaves, Arkwright, and Watt were beginning to produce their effects,—partly to the enormous expenditure of Government, and to the subsidies and loans which were lavished on the Continental powers and expended in the purchase of British manufactures. But the condition of the working classes became deplorable. Mr. Porter has proved with minute exactness that the real burden of the long and exhausting Continental war was, as far as England is concerned, mainly sustained by labor.

In 1803 the income tax, under the name of a property tax, was reimposed. The sources of income were distinguished and put into five schedules named A, B, C, D, E,—being respectively lands, tenements, mines, etc.; occupancies or tenancies; shares, annuities, and dividends; profits and gains in professions and callings; and public offices of profit and pensions. On all but the second a tax of a shilling in the pound was levied, but on the second ninepence only in England and sixpence in Scotland. Incomes below £60 a year were exempt from the tax, and, following the analogy in some degree of the first income tax, a reduction of the rate was made in incomes increasing by £10 a year up to £150, beginning at threepence in the pound tax up to elevenpence, the largest remission being made on the largest income. But it will be observed that, as in the first income tax, the quantity payable increased with the income, so in this system the deduction increased with the receipts of the taxpayer, though it ceased at a low amount of income. Furthermore, some consideration was shown to those who had families. Those householders who had more than two children were allowed, on incomes between £60 and £400, a reduction in the rate of 4 per cent. for each child; those between £400 and £1000, 3 per cent.; those between £1000 and £5000, 2 per cent.; those who had £5000 and upwards, 1 per cent. for each child.

In 1805, 25 per cent. was added to the income tax, and in 1807 it was raised to two shillings in the pound on incomes in schedules A, C, D, and E, and to eighteenpence in England and a shilling in Scotland on the annual rental of tenancies under schedule B. The limit of exception was lowered to £50, and an abatement of a shilling in the pound was allowed on all incomes between £50 and £150 a year. Laborers and artisans whose earnings were less than thirty shillings a week were exempted from the tax, but it does not appear that the deductions in the case of children were allowed, as in the Act of 1803. The war income tax was levied up to April 5, 1816, when it expired, and despite the efforts of Castlereagh and others who urged its continuance, parliament refused to sanction the impost any longer.

The rejection of the income tax as a means of revenue in 1816 necessitated, at the winding up of the costly Continental war, the imposition of indirect taxes upon most processes of production and all of consumption, for the corn laws and customs duties on foreign imports of food exalted indirectly the value of home produce. Industry was checked at its source. Food, the raw material of labor, was rendered scarce, while the farmer, who conceived that the maintenance of the corn laws was his only hope of profit, and the sole power by which he could pay his rent, was mocked by violent fluctuations of prices, and was equally ruined by plenty and by scarcity.

The first hint given that the progress of the nation was impossible until its fiscal system was revised, was the formation and presentation of the Merchants' Petition. This remarkable document was drawn up by Mr. Tooke, who has narrated, in the last volume of his *History of Prices*, the circumstances under which it was composed, signed, and presented to the House of Commons. It was not presented in the House of Lords, for Tooke had resolved on committing the document to the hands of Lord Lansdowne. But those who had signed the petition objected to this nobleman, on the ground of his Whig principles, and the framer of the petition would not give way. The petition was presented to the House of Commons by Mr. Baring, afterwards Lord Ashburton, and was debated. The Government, that of Lord Liverpool, expressed its agreement in the principles which the petition avowed,—those, in short, of free trade,—and admitted that these principles were not only abstractedly correct, but ought to be adopted at once if one were making a beginning, but declined to agree to the inference that they could be adopted in a country where trade and commerce were and had been for so long a time based on artificial restrictions. The protected interests, however, signified pretty clearly that they would not allow themselves to be molested. But the Government granted a committee of inquiry on foreign trade, and with this committee commences the movement which six-and-twenty years later culminated in the practical adoption of free trade principles and in the abolition of the corn laws. Such a result was only a question of time, when Lord Liverpool could say in May, 1820:—"We have risen to our present greatness under a different system than that of free and unrestricted trade. Some suppose that we have risen in consequence of that system. Others, of whom I am one, believe that we have risen in spite of that system. It is utterly impossible, with our debt and taxation, even if they were but half their amount, that we can suddenly adopt the system of free trade." Lord Liverpool probably knew that, as Swift had said, "in the arithmetic of the custom-house, two and two do not always make four;" but he was not alive to the enormous fertility of that system of finance which, substituting low for high duties, with some exceptions, and invariably avoiding such fiscal changes as hinder the progress of industry, leaves the widest opportunities for production, exchange, and consumption. Lord Liverpool added that though he supported the corn law of 1815 as a measure of justice to the agricultural interest, he was of opinion that had the bill not passed at that time, it should not have been passed at all. It may be observed, so much was trade hampered at this time by legislation the primary object of which was to extract a revenue at all costs and hazards, that there were more than 1500 custom-house acts relating to the entry, export, and custody of goods.

The committee of the Commons continued its sittings through three sessions, and presented four reports on the subject of foreign trade, accompanied by abundant evidence. The committee of the Lords sat for two sessions, and presented two reports. The necessity for admitting the principles of free trade was felt and expressed by the committee; but so much alarm was excited among protected interests, even by the recognition of the abstract propriety of free exchange, that the committee felt it necessary to strongly disclaim any sympathy with sudden change, and to calm frightened imaginations by declaring that the greatest prudence and circumspection must precede any project, and accompany any measure of reform. The first thing, however, which people recognized was that great additional taxation did not add but in a very small degree to the income of the exchequer. This was the effect of the financial statement of 1819, which Tooke justly characterizes as the last thoroughly vicious project accepted by the House. In 1823 Mr. Vansittart retired from office, and during the next five years, when Mr. Huskisson was at the Board of Trade, great and notable modifications were made in the customs and excise for taxes amounting in the aggregate to £8,340,000 were remitted, the experiment being attended by a manifest elasticity in the revenue. The enormous aggregate of custom-house statutes was consolidated into eleven, by the labors of Mr. Deacon Hume. Between 1827 and 1841 further reforms, though not on so considerable a scale, were made, the most important of which was the abandonment of the excise on beer in 1830, and that on printed cottons in 1831. It is an apt illustration of the effect induced by such duties as this, that within a very short time the price of cottons fell below the amount (3½d. a yard) which was levied under the old excise. But, on the whole, little was done for a systematic financial reform during the period which elapsed between the death of Mr. Huskisson and the defeat of the Melbourne administration. One change of great importance was made in the adoption of Mr. Rowland Hill's plan of the penny postage. This scheme involved the immediate sacrifice of revenue to the amount of a million and a quarter, but it gave a considerable impetus to trade, and rendered the discussion of those further fiscal reforms which were effected by Sir Robert Peel easy, perhaps possible.

Sir Robert Peel's ministry was formed in September, 1841, and had before it a task of no common magnitude. For five years the average deficiency of the revenue, according to Sir Stafford Northcote's statement, had averaged a million and a half, the year in which Sir Robert Peel took office having been characterized by the largest deficiency. The cause of this was that the revenue had fallen short of the estimates; in other words, the financial system of the country was fundamentally vicious. The reforms which Sir Robert Peel immediately determined to bring about were greatly assisted by the information obtained from Mr. Joseph Hume's report of 1840, which stated "that the tariff contained 1150 different rates of duty chargeable on imported articles, besides others imposed on all unenumerated articles; that there was no principle in the finance of the country, some duties being levied for the sake of revenue, some for that of protection; that serious detriment to the home consumer ensued from the differential duties in favor of the colonies; and that of 862 articles chargeable with duty 147 paid no duty at all, while 17 articles supplied 94 per cent. of the revenue, 29 others 4 per cent. more, so that 816 articles yielded no more than 2 per cent. of the revenue, though the imposition of the customs duties was a serious hindrance to trade and manufactures."

In drawing up his budget of 1842, Peel had three expedients before him. One was to adjust the corn laws, so as to make them press less heavily on the consuming and manufacturing classes; the second, to reform the tariff; the third, to obviate the constant deficit in the revenue. The first was undoubtedly the most pressing. The depression of trade and manufactures in 1842 was so serious, and the remedy in a repeal or great reduction of the taxes on food was so obvious to all rational persons, that the measure was in the highest degree expedient. But Peel could not as yet venture upon it; the mere proposal to levy a foreign fixed duty on corn had more than anything else contributed to the downfall of the Whigs in 1841, and the measure was postponed till it was yielded to famine and agitation by an angry and disappointed faction.

Sir Stafford Northcote, in discussing the fact why the Whigs were the freetraders and the Tories the protectionists in 1842–46, says he sees no particular reason why this phenomenon should have been exhibited, judging from the antecedents of the two historical parties, and he inclines to believe that the Whigs were discredited in the eyes of their opponents by their associations with the Radical party. But the solution of the question is not far to seek. The reforms of Mr. Huskisson applied solely to commerce and manufactures, to colonial interests, and to some local industries. Most of those who represented such interests were alive to the fact that protection was no longer necessary for them, or that it was inexpedient that the consumers of colonial produce should be exceptionally taxed in order to give a subvention to colonial planters and their agents. The majority which supported Peel would have been on the whole indifferent to such financial reforms as simply affected manufactures and foreign trade. As consumers, they were benefited by the cheapening of such produce; as producers themselves, they had wit enough to discern that the general prosperity of the country improved the market of the agriculturist. But when it came to be a question whether the artificial prices which the sliding scale was supposed to bestow on farmers and landowners should be abandoned, they were convinced that their interests were being sacrificed; and though they constantly tried to alarm the public with the bugbear of dependence on foreign supply, they frequently admitted that the struggle on their part was to maintain the existing level of their rents. In the 18th century, especially in its earlier half, the country gentlemen would have had no difficulty in accepting free trade, provided they could escape the land tax, for the produce of the country was on an average in excess of its wants; in the first half of the 19th century, they were firmly convinced that all their interests were bound up in the sliding scale, and it must be admitted that the Ricardian theory of rent, now become popular, gave them certain grave scientific reasons for the belief which they entertained.

The estimates which Sir Robert Peel formed suggested that, if the House would accept his new system of finance, he should be in the possession of a surplus of £1,800,000. The greater part of this sum he proposed to devote to the remission of taxation, the particulars of which may be found in the works of Sir Stafford Northcote, of Mr. Tooke, and Mr. M'Culloch. The estimates, partly from some singular oversights of Sir Robert Peel, partly from the fact that the distress of the country was too serious to be cured by trifling remedies, were a failure, for the receipts of the exchequer, notwithstanding the new taxes which Peel imposed, were two millions less than he anticipated. The process by which the minister sought to put the finances of the country on a sound basis, and to provide a surplus in future years, was the income tax,—an impost which had been decisively rejected in 1816, but was now reimposed for five years at 7d. in the pound. The character of this tax of 1842 varied a little from the old tax of 1803, 1805, and 1808. The limit of exemption was fixed at £150 a year, the old schedules were retained, but the farming classes were specially favored. The rate previously levied on these persons had been three-fourths of the tax imposed on those who are comprised in the other schedules. In 1842 it was made one-half. The income tax was not extended to Ireland, but a higher tax was put on Irish spirits, and on the whole the Irish and English stamp duties were equalized.

The question has been raised, whether, in case the corn laws had been at once repealed, it would have been necessary to impose the income tax. It is probable that the answer should be in the negative. But apart from the difficulties in the way of a measure which would certainly at this time, as it did four years afterwards, have roused the most angry feelings, it may be safely stated that Peel's proper business was to establish a surplus, and to effect this in the surest way possible. He could not have succeeded in imposing a just property tax, for such a tax would have been nearly as unpopular among his supporters as a repeal of the corn laws. He therefore imposed an income tax, and though the scheme was criticised adversely, both in the Commons and the Lords, it was carried by overwhelming majorities in both Houses, the arguments against the tax being summed up with great precision in the protests of Lords Radnor and Western. The income tax has since always figured in the budget, and it cannot be denied that, whatever objections may be alleged against its equity, it secured the end which Peel had before him, and has more than once been of great service in supplying the deficiencies of revenue due to an increased expenditure.

In 1843 and 1844 a few remissions of customs duties were effected. But the effect of the tariff reforms was now visible. The excess of income over expenditure in the first year was 2 millions, in the second 6½ millions. The wheat crop of 1843 was an average, that of 1844 was abundant; the price was low, and the imports of foreign corn nearly ceased. In consequence, Peel was enabled to bring forward his most considerable measure of tariff reform. He remitted no less than 3½ millions in the customs, and more than a million in the excise. The effect was an increase of income over expenditure of nearly 2½ millions. In 1846 the remission was three-quarters of a million, but there was again a surplus of 2¾ millions. In the same year the repeal of the corn laws was effected, and a modification was made in the sugar duties, followed in 1848 by an equalization of these duties. A little later and the Navigation Acts were repealed; and, finally, the last fragment of protection was extinguished in the abolition of the differential duties on foreign timber. The detailed history of these changes is best given in the last three volumes of Mr. Tooke's *History of Prices*, and in the annual summaries of the *Economist* newspaper, compiled by Mr. Newmarch, who was the coadjutor of Mr. Tooke in the last three volumes of the history referred to. The process by which the new system of finance was established is described and illustrated by Sir Stafford Northcote in his *Twenty Years of Financial Policy*.

The principles of modern English finance are—(1) to impose as high a duty as is consistent with the prosperity of the revenue on such articles of voluntary consumption as may be dispensed with and may be taken in excess;—of these the most notable are alcoholic liquors and tobacco; (2) to abandon taxation on all articles which are used for manufacture or food, the last tax of the latter kind which has been extinguished being that on sugar; (3) to levy the lowest duties possible, consistent with revenue purposes, on articles of voluntary consumption and wholly innocent use, of which the best type is tea;—such are the customs and excise, the only trades now under the control of the inland revenue officers being those of the maltster, the brewer, and the distiller; (4) to attempt the collection of as large a revenue as possible at the lowest possible rates on transactions by the mechanism of stamp duties; (5) to simplify the assessed taxes, some of which indeed, as the house duty, are objectionable, and some of which have been perhaps imprudently remitted; and (6) to make use of the income tax as a supplementary means of raising a revenue when the expenditure is notably in excess of the income. Nothing, indeed, is simpler than the function of the chancellor of the exchequer, if he is resolved not to modify the established sources of the revenue or readjust its parts. All that is needed is to impose an additional income tax, or to remit a portion of that which has been imposed.

It will be seen, however, that the continuity of the present system of British finance depends upon a continuity in the habits of the people. The revenue derived from alcoholic liquors and tobacco amounts annually to about 42 millions. That which is supplied from articles of voluntary consumption, the use of which is wholly innocent, is about 4½ millions, the principal contribution to this head coming from tea. Purely direct taxation—the land, house, and income tax on the one hand (the last-named at 3d. in the pound), and stamps, probate, and legacy duties on the other—yield nearly equal sums, a little short of 8 millions each. The post office, which is *sui generis*, *i.e.*, a payment for a special service rendered, supplies a further gross sum of 7 millions. The security, then, of the English revenue depends on the extent to which the habits of consuming alcoholic liquors and tobacco are permanent. The consumption of the former is threatened by a powerful and apparently growing organization and agitation, and it can hardly be doubted that, should those who demand that the control of the traffic in alcoholic liquors ought to be transferred from the present licensing bodies to a direct popular vote be successful, the dimensions of the trade would be curtailed and the revenue diminished. One cannot otherwise account for the alarm which is felt by those interested in the success of the trade at the activity of their critics, and the process by which the advocates of restraint believe that they can compass their ends. It is possible, also, that in the future the poorer classes, whose consumption is the cause of so large a revenue, may imitate the temperance or moderation of those who are better off, and whose habits are to all appearance in marked contrast to those of their progenitors two or three generations ago. Should such a change ensue, it is not easy to determine what would be the direction taken by the financiers of the future; for though there are some obvious sources of taxation, particularly real estate devised or inherited, and property specially so called, yet the receipts from these sources would necessarily be limited, and there is nothing more difficult, as we have attempted to show, than the task of familiarizing a people with a new impost.

We need not be surprised that such a difficulty is felt and must be encountered when the financier attempts new expedients; for, apart from the natural dissatisfaction with which a new tax is paid, and the resistance which powerful interests may make and have made to such imposts, such as we have seen to have been successful when Pitt attempted to levy an equal charge on the succession to personal and real estate, a tax may make a serious difference to values, or may interfere fatally with an industry. Thus there can be no doubt that the exemptions with which land is favored in the devolution of real estate is a cause why the rate of return to the purchase money of land is so low. Fixed charges will, of course, in the long run make no difference to the rate of interest derived from investments in land, though they would diminish the value to the vendor. Thus the value of land in France is as high or nearly as high as it is in England, and is much higher in Belgium, though in both countries there is a heavy land tax. But freedom from an accidental tax, a tax which cannot be computed beforehand, is a direct advantage to the vendor, and in the case of land would add to the number of years' purchase at which the land is sold.

The taxes which have been laid on industry and consumption, apart from the reckless manner in which they were imposed, were felt far more severely in their first incidence than they were when they became familiar. There is a convenient and suggestive example of the manner in which such taxes affect industry in a matter of recent experience. Apart from the question whether Mr. Lowe's abortive match tax was in itself a judicious impost,—a question which, it may be affirmed, most persons would answer in the negative,—it became plain, when the proposal was made, that two results would follow from its adoption. It would seriously curtail the employment of a very large class of very ill-paid laborers, and thereupon induce great distress on those who were already very poor, and it would ultimately transfer the industry to those countries where no excise is levied on the manufacture. Already, although matches are bulky in proportion to their value, and are conveyed from the place of their origin to the market of consumption at very high rates, owing to the dangerous character of the goods, the competition of a place so distant as Jönköping in Sweden against the English manufacturer is so sharp as to lower materially the profits of the home producer, and to make it necessary that the manufacture should be carried on by low-priced labor. It is almost certain that, had the scheme of taxing matches been adopted, the supply of these articles would have rapidly been limited to foreign producers, or it would have been necessary to have established, simultaneously with the impost, a really protective duty on the foreign article.

Manufactures, indeed, unless they are wholly ruined by taxation, or at least confined to domestic supply, can be and are made to accommodate themselves to circumstances. The amount of capital employed in supplying the taxed commodity diminishes with the demand, competition between capitalists slackens, and in due time the rate of profit in the particular industry reaches its old level. But the process is undoubtedly accompanied by loss to both capitalist and laborer, as well as followed by an enhancement of price to the consumer, together with a still more serious depression of foreign trade, however fully the duties levied are allowed on export. In illustration of the effect which an erroneous system of finance induces on industry, nothing can be more instructive than the history of the revenue in the few years preceding Peel's administration of 1841; the effect of the reform in the tariff which that minister adopted; and the loss which ensued from postponing the full effect of these reforms owing to the hesitation which Peel showed in abolishing the corn laws, which could have been much better repealed in 1843 than in 1846.

It is said, and has been said for the last century, that it is inexpedient to tax capital. To this we have already given the answer, A Government can tax nothing but capital, actual or potential. For all wealth is of two kinds. The first is that which is absolutely necessary for the continuity of industry, and which cannot be taxed without destroying that industry. There can be no tax on necessary consumption. The second is that which can be saved, which is in part saved, in part consumed unproductively.

This product of labor can be and can alone be taxed. The English system of finance attempts to levy taxation on a part of this, either directly on revenue, though it might be levied with advantage on the wealth itself, instead of or concurrently with the revenue derived from the wealth, or indirectly on consumption. Nor does the taxation of capital diminish capital. It merely changes its direction. The tax may be expended unwisely, even mischievously. But it undoubtedly calls labor into activity, and may therefore give wider employment than it would if left in the hands of those who are now mulcted of a portion of what they might have saved or spent. It may even increase capital by increasing economy in expenditure, and inducing those who are taxed to fill up the void in their own resources which the tax has created. The expenditure of the Dutch in the palmy days of their finance was enormous; the taxation to which the people submitted was searching to an extent and minuteness which has had no parallel since; but, notwithstanding the prodigious sacrifices which the people made, they accumulated capital so rapidly by reason of parsimony, that those who watched the financial condition of the republic made all sorts of guesses as to what could be the reason why enormous taxation was accompanied by a singularly low rate of interest, and at last some persons, absurdly enough, asserted that the taxation was itself the cause of the low rate.

Apart from imperial finance, the wealth of this country is liable to other levies imposed for local purposes. Most local taxation is direct, and imposed on occupation. Some, however, is indirect, and levied on consumption. Again, some local taxation is imposed in satisfaction of a local duty, some in consideration of a local service. Thus the duty on coals consumed within a particular radius from St. Paul's cathedral, originally, we are told, imposed in order to meet some of the losses incurred by the great fire of London, is a tax on consumption, analogous to the octroi duties imposed in Continental towns. The county and borough rates imposed for the maintenance of roads and of police, rates levied for the use of gas and water, are payments intended to be the equivalents of public service, and capable, with greater or less exactness, of being apportioned to the amount of benefit received by the taxpayer. Of late years some large towns have made use of their local needs for the purpose of creating capital on the security of rates and of deriving some of the profits of a joint-stock company from the sale of gas and water, with a view to lightening other local burdens of a more general kind. Under proper safeguards, such a form of local finance is beneficial and to be encouraged. It bears a close analogy to the Government service of the post office.

Local finance has followed in one particular the precedent supplied it by the central Government, in anticipating its revenue by loans. Most of these loans, however, are terminable, *i.e.*, provision is made for repayment of principal as well as interest. The amount of these loans is in excess of 100 millions, and is likely to increase. But most of the increased charge is to be put down to the head of remunerative outlay, there being, as we have stated, an increased disposition—indeed from necessity—on the part of local authorities to undertake the satisfaction of public services, or the supply of public conveniences. The aggregate annual expenditure of the United Kingdom for local and imperial taxation, including loans, is now about 125 millions.

The authorities relied on for this article are principally—for ancient history, Boeckh's *Public Economy of Athens*, and Dureau de la Malle. *Économie politique des Romains;* and for modern times—Macpherson's *Dictionary of Commerce;* Grellier's *History of the National Debt;* Porter's *Progress of the Nation;* Sir Stafford Northcote's *Twenty Years of Financial Policy; The Statutes at Large*, in the edition commencing from the first volume printed by Berthollet for Henry VIII. and continued in the same form to the present time; Hansard's *Parliamentary Debates*, etc. (J. E. T. R.)

FINCH (German *Fink*, Latin *Fringilla*), a name applied (but almost always in composition—as Bullfinch, Chaffinch, Goldfinch, Hawfinch, etc.) to a great many small birds of the Order *Passeres*, and now pretty generally accepted as that of a group or family—the *Fringillidæ* of most ornithologists. Yet it is one the extent of which must be regarded as being uncertain. Many writers have included in it the Buntings (*Emberizidæ*), though these seem to be quite distinct, and the grounds of their separation have been before assigned (*cf.* BUNTING, vol. iv. p. 470), as well as the Larks (*Alaudidæ*), the Tanagers (*Tanagridæ*), and the Weaver-birds (*Ploceidæ*)—the mode in which these three last differ having in due time to be shown in these pages. Others have separated from it the Crossbills, under the title of *Loxiidæ*, but without due cause (*cf.* CROSSBILL, vol. vi. p. 542), while again some systematists have placed among the Finches the Mouse-birds (*Coliidæ*)—an allocation which a very slight study of osteological characters would have proved to be unsound; and a group which has no English name, including probably the genera *Panurus* (the so-called Bearded Titmouse), *Paradoxornis*, and, perhaps, a few others, has also been occasionally referred to the Finches, to all appearance erroneously. The difficulty which at this time presents itself in regard to the limits of the *Fringillidæ* arises from our ignorance of the anatomical features, especially those of the head, possessed by many exotic forms.

Taken as a whole, the Finches concerning which no reasonable doubt can exist, are not only little birds with a hard bill, adapted in most cases for shelling and eating the various seeds that form the chief portion of their diet when adult, but they appear to be mainly forms which predominate in and are highly characteristic of the Palæarctic Region; moreover, though some are found elsewhere on the globe, the existence of but very few in the Notogæan hemisphere can as yet be regarded as certain.

But even with this limitation, the separation of the undoubted *Fringillidæ*[1] into groups is a difficult task. Were we merely to consider the superficial character of the form of the bill, the genus *Loxia* (in its modern sense) would be easily divided not only from the other Finches, but from all other birds. The birds of the genus—the Crossbills—when their other characters are taken into account, prove to be intimately allied on the one hand to the Grosbeaks (*Pinicola*) and on the other through the Redpolls (*Ægiothus*) to the Linnets (*Linota*)—if indeed these two can be properly separated. The Linnets, through the genus *Leucosticte*, lead to the Mountain-Finches (*Montifringilla*), and the Redpolls through the Siskins (*Chrysomitris*) to the Goldfinches (*Carduelis*); and these last again to the Hawfinches, one group of which (*Coccothraustes*) is apparently not far distant from the Chaffinches (*Fringilla* proper), and the other (*Hesperiphona*) seems to be allied to the Greenfinches (*Ligurinus*). Then there is the group of Serins (*Serinus*), to which the Canary-bird belongs, that one is in doubt whether to refer to the vicinity of the Greenfinches or that of the Redpolls. The Mountain-Finches (before named) may be regarded as pointing first to the Rock-Sparrows (*Petronia*) and then to the true Sparrows (*Passer*); while, returning to the Grosbeaks, we find them passing into many varied forms which regard to space forbids our here naming, and throwing out a very well marked form—the Bullfinches (*Pyrrhula*). But our readers must be prepared to take all this as problematical. Some of the modifications of the Family are very gradual, and therefore conclusions founded on them are likely to be correct; others are further apart, and the links which connect them, if not altogether missing, can but be surmised. To avoid as much as possible prejudicing the case, we shall therefore take the different groups of *Fringillidæ* which it is convenient to consider in this article in an alphabetical arrangement.

The BULLFINCHES thus present themselves first. Of these the best known to our readers will be the familiar bird (*Pyrrhula europæa*), which hardly needs description. The varied plumage of the cock—his bright red breast and his gray back, set off by his coal-black head and quills—is naturally attractive; while the facility with which he is tamed, with his engaging disposition in confinement, makes him a popular cage-bird,—to say nothing of the fact (which in the opinion of so many adds to his charms) of his readily learning to "pipe" a tune, or some bars of one, though this perversion of his natural notes is hardly agreeable to the ornithologist. By gardeners the Bullfinch has long been regarded as a deadly enemy, from its undoubted destruction of the buds of fruit-trees in spring-time, though whether the destruction is really so much of a detriment is by no means so undoubted. Northern and Eastern Europe is inhabited by a larger form (*P. major*), which differs in nothing but size and more vivid tints from that which is common in the British Isles and Western Europe. A very distinct species (*P. murina*), remarkable for its dull coloration, is peculiar to the Azores, and several others are found in Asia from the Himalayas to Japan. Recently a Bullfinch (*P. cassini*) has been discovered in Alaska, being the first recognition of this genus in the New World.

---

[1] About 200 species of these have been described, and perhaps 150 may really exist.

The CANARY-BIRD (*Serinus canarius*) is indigenous to the islands whence it takes its name, as well, apparently, as to the neighboring groups of the Madeiras and Azores, in all of which it abounds. It seems to have been imported into Europe at least as early as the first half of the 16th century,[1] and has, as everybody knows, since become the commonest of cage-birds. The wild stock is of an olive-green, mottled with dark-brown above, and greenish-yellow beneath. All the bright-hued examples we now see in captivity have been induced by carefully breeding from any chance varieties that have shown themselves; and not only the color, but the build and stature of the bird have in this manner been greatly modified. Of late the ingenuity of "the fancy," which might seem to have exhausted itself in the production of topknots, feathered feet, and so forth, has brought about a still further change from the original type. It has been found that by a particular treatment, in which the mixing of large quantities of cayenne-pepper with the food plays an important part, the ordinary "canary yellow" may be intensified so as to verge upon a more or less brilliant flame color. Birds which have successfully undergone this forcing process, and hence called "hot canaries," command a very high price, for a large proportion die under the discipline, though it is said that they soon become exceedingly fond of the exciting condiment. But it is impossible here to treat of this species in its domesticated state. A small library of books has been written on the subject.[2]

Very nearly resembling the Canary-bird, but smaller in size, is the SERIN (*Serinus hortulanus*), a species which not long since was very local in Europe, and chiefly known to inhabit the countries bordering on the Mediterranean. It has of late years pushed its way towards the north, and has even been several times taken in England (Yarrell's *Brit. Birds*, ed. 4, ii. pp. 111–116). A closely allied species (*S. canonicus*) is peculiar to Palestine.

The CHAFFINCHES next demand our attention, and these are regarded as the type-form of *Fringillidæ*. The handsome and sprightly species (*Fringilla cœlebs*[3]), which is so common throughout the whole of Europe, requires no description. Conspicuous by his variegated plumage, his peculiar call-note,[4] and his glad song, the cock is almost everywhere a favorite. In Algeria our Chaffinch is replaced by a closely allied species (*F. spodogenia*), while in the Atlantic Islands it is represented by two others (*F. tintillon* and *F. teydea*)—all of which, while possessing the general appearance of the European bird, are clothed in soberer tints.[5] Another species of true *Fringilla* is the Brambling (*F. montifringilla*), which has its home in the birch forests of northern Europe and Asia, whence it yearly proceeds, often in flocks of thousands, to pass the winter in more southern countries. This bird is still more beautifully colored than the Chaffinch—especially in summer, when, the brown edges of the feathers being shed, it presents a rich combination of black, white, and orange. Even in winter, however, its diversified plumage is sufficiently striking.

With the exception of the single species of Bullfinch already noticed as occurring in Alaska, all the forms of Finches on which we have dwelt are peculiar to the Palæarctic Region. Consideration of some of the remaining forms which have been incidentally named is deferred. (A. N.)

FINCH, DANIEL and HENEAGE. See NOTTINGHAM, EARLS OF.

FINCK, HEINRICH, a celebrated German musical composer, of whose life little more is known than that he was of Saxon origin, and that between 1492 and 1506 he was chapelmaster to two successive kings of Poland, at whose court in Warsaw he resided. After this he seems to have retired to Wittenberg in Saxony, where he died. The year of his death, like that of his birth, is uncertain. His works, mostly part songs and other vocal compositions, show great musical knowledge, and amongst the early masters of the German school he holds a high position. They are found scattered amongst ancient and modern collections of songs and other musical pieces. The library of Zwickau possesses a work containing a collection of fifty-five songs by Finck, printed about the middle of the 16th century.

FINCK, HERMANN, the nephew of the subject of last notice, has frequently been mistaken for him. The date of his birth (at Pirna in Saxony) also is uncertain, but it has recently been discovered that in 1506 he succeeded his uncle in the position of royal chapelmaster to the king of Poland. After 1553 he lived at Wittenberg, and there, in 1555, was published his collection of "wedding songs." His most celebrated work is entitled *Practica musica, exempla variorum signorum, proportionum, et canonum, judicium de tonis ac quædam de arte suaviter et artificiose cantandi continens* (Wittenberg, 1557). It is of great historic value, but very rare. The Paris library, the Vienna court library, and the Prague library possess a copy each, and there are three or four copies in the royal library at Berlin.

FINDEN, WILLIAM (1787–1852), English line engraver, was born in 1787. He served his apprenticeship to one James Mitan, but appears to have owed far more to the influence of James Heath, whose works he privately and earnestly studied. His first employment on his own account was engraving illustrations for books, and among the most noteworthy of these early plates were Smirke's illustrations to Don Quixote. His neat style and smooth finish made his pictures very attractive and popular, and although he executed several large plates, his chief work throughout his life was book illustration. His younger brother, Edward Finden, worked in conjunction with him, and so much demand arose for their productions that ultimately a company of assistants was engaged, and plates were produced in increasing numbers, their quality as works of art declining as their quantity rose. The largest plate executed by William Finden was the portrait of King George IV. seated on a sofa, after the painting by Sir Thomas Lawrence. For this work he received two thousand guineas, a sum larger than had ever before been paid for an engraved portrait. The demand for this print was for a time so great that proofs were advertised at a price largely in advance of the publication price. But the reputation of the subject, of the painter, and of the engraver have alike declined. Finden's next works on a large scale were the Highlander's Return and the Village Festival, after Wilkie's well-known works, the latter now forming part of the national collection. These are esteemed as Finden's happiest works. Later in life he undertook, in co-operation with his brother, aided by their numerous staff, the publication as well as the production of various galleries of engravings. The first of these, a series of landscape and portrait illustrations to the life and works of Byron, appeared in 1833 and following years, and was a very successful venture. Other attempts of a like kind were less so; and by the last, the most costly, and by far the most deserving of success, both for its subjects and the quality of its workmanship, the *Gallery of British Art*, he lost the fruits of all his former success. Of this *Gallery* fifteen parts were published between 1838 and 1840. Finden's last undertaking was an engraving on a large scale of Hilton's Crucifixion, which was completed just before his death. The plate was bought by the Art Union for £1470. A few days before his death this industrious engraver joined with a few of his brothers in art in a petition to the queen for the admission of engravers to the honors of the Royal Academy. He died in London, unmarried, September 20, 1852.

FINE, in law, is a pecuniary penalty inflicted for the less serious offences. Fines are necessarily discretionary as to amount; but a maximum is generally fixed when the penalty is imposed by statute. And it is an old constitutional maxim that fines must not be unreasonable. In Magna Charta, c. 111, it is ordained "*Liber homo non amercietur pro parvo delicto nisi secundum modum ipsius delicti, et pro magno delicto secundum magnitudinem delicti.*"

---

[1] The earliest published description seems to be that of Gesner in 1555 (*Orn.*, p. 234), but he had not seen the bird, an account of which was communicated to him by Raphael Seiler of Augsburg, under the name of *Suckervögele*.

[2] Those most to be commended are perhaps *The Canary Book* by Robert L. Wallace, *Canaries and Cage Birds* by W. A. Blackston, and of course Mr. Darwin's *Animals and Plants under Domestication* (vol. i. p. 295). An excellent monograph of the wild bird is that by Dr. Carl Bolle (*Journ. für Orn.*, 1858, pp. 125–151).

[3] This fanciful trivial name was given by Linnæus on the supposition (which later observations do not entirely confirm) that in Sweden the hens of the species migrated southward in autumn, leaving the cocks to lead a celibate life till spring. It is certain, however, that in some localities the sexes live apart during the winter.

[4] This call-note, which to many ears sounds like "pink" or "spink," not only gives the bird a name in many parts of Britain, but is also obviously the origin of the German *Fink* and our *Finch*. The similar Celtic form *Pinc* is said to have given rise to the Low Latin *Pincio*, and thence come the Italian *Pincione*, the Spanish *Pinzon*, and the French *Pinson*.

[5] This is especially the case with *F. teydea* of the Canary Islands, which from its dark coloring and large size forms a kind of parallel to the Azorean *Pyrrhula murina*.

The term is also applied to payments made to the lord of a manor on the alienation of land held according to the custom of the manor, to payments made on the renewal of leases granted by ecclesiastical and other corporations, and to other similar payments.

Fine also denotes a fictitious suit at law, which played the part of a conveyance of landed property. "A fine," says Blackstone, "may be described to be an amicable composition or agreement of a suit, either actual or fictitious, by leave of the king or his justices, whereby the lands in question become or are acknowledged to be the right of one of the parties. In its original it was founded on an actual suit commenced at law for the recovery of the possession of land or other hereditaments; and the possession thus gained by such composition was found to be so sure and effectual that fictitious actions were and continue to be every day commenced for the sake of obtaining the same security." Freehold estates could thus be transferred from one person to another without the formal delivery of possession which was generally necessary to a feoffment. This is one of the oldest devices of the law. A statute of 18 Edward I. describes it as the most solemn and satisfactory of securities, and gives a reason for its name—"Qui quidem finis sic vocatur, eo quod finis et consummatio omnium placitorum esse debet, et hac de causa providebatur." The action was supposed to be founded on a breach of covenant: the defendant, owning himself in the wrong,[1] makes overtures of compromise, which are authorized by the *licentia concordandi;* then followed the concord, or the compromise itself. These, then, were the essential parts of the performance, which became efficient as soon as they were complete; the formal parts were the *nots*, or abstract of the proceedings, and the *foot* of the fine, which recited the final agreement. Fines were said to be of four kinds, according to the purpose they had in view, as, for instance, to convey lands in pursuance of a covenant, to grant reversionary interest only, etc. In addition to the formal record of the proceedings, various statutes required other solemnities to be observed, the great object of which was to give publicity to the transaction. Thus by statutes of Richard III. and Henry VII. the fine had to be openly read and proclaimed in court no less than sixteen times. A statute of Elizabeth required a list of fines to be exposed in the Court of Common Pleas and at assizes. The reason for these formalities was the high and important nature of the conveyance, which, according to the Act of Edward I. above mentioned, "precludes not only those which are parties and privies to the fine and their heirs, but all other persons in the world who are of full age, out of prison, of sound memory, and within the four seas, the day of the fine levied, unless they put in their claim on the foot of the fine within a year and a day." This barring by *non-claim* was abolished in the reign of Edward III., but restored with an extension of the time to five years in the reign of Henry VII. The effect of this statute, intentional according to Blackstone, unintended and brought about by judicial construction according to others, was that a tenant-in-tail could bar his issue by a fine. A statute of Henry VIII. expressly declares this to be the law. Fines, along with the kindred fiction of recoveries, were abolished by statute 3 and 4 Will. IV. c. 74, which substituted a deed enrolled in the Court of Chancery.

Fines are so generally associated in legal phraseology with recoveries that it may not be inconvenient to describe the latter in the present place. A recovery was employed as a means for evading the strict law of entail. The purchaser or alienee brought an action against the tenant-in-tail, alleging that he had no legal title to the land. The tenant-in-tail brought a third person into court, declaring that he had warranted his title, and praying that he might be ordered to defend the action. This person was called the *vouchee*, and he, after having appeared to defend the action, takes himself out of the way. Judgment for the lands is given in favor of the plaintiff; and judgment to recover lands of equal value from the vouchee was given to the defendant, the tenant-in-tail. In a real action, such lands when recovered would have fallen under the settlement of entail; but in the fictitious recovery the vouchee was a man of straw, and nothing was really recovered from him, while the lands of the tenant-in-tail were effectually conveyed to the successful plaintiff. A recovery differed from a fine, as to *form*, in being an action carried through to the end, while a fine was settled by compromise, and as to effect, by barring all reversions and remainders in estates tail, while a fine barred the issue only of the tenant. (E. R.)

Preliminary definition.

FINE ARTS, THE. Fine art is the abstract or collective name given to the results of a whole group of human activities; the activities themselves which constitute the group being severally called the FINE ARTS. In antiquity the fine arts were not explicitly named, nor even distinctly recognized, as a separate class. In other modern languages besides English they are called by the equivalent name of the beautiful arts (*belle arti, beaux arts, schöne Künste*). The fine or beautiful arts, then, are those among the arts of man which minister, not to his material necessities or conveniences, but to his love of beauty (using the word beauty in its widest sense); or if any art fulfils both these purposes at once, still as fulfilling the latter only is it called a fine art. Thus architecture, in so far as it provides shelter and accommodation, is one of the useful or mechanical arts, and one of the fine arts only in so far as its structures give pleasure by the aspect of strength, fitness, harmony and proportion of the masses, by disposition and contrast of light and shade, by color and enrichment, by variety and relation of lines, surfaces, and intervals.

Conflicting results of inquiry into the nature of beauty.

There is no difference of opinion concerning the nature of fine art and the fine arts as thus generally described, and as contra-distinguished from art and the arts mechanical. It is acknowledged that the one set of arts exists to satisfy practical needs, and the other set exists to give delight and satisfy the sense of beauty, while as to an intermediate set of arts which exist for both purposes, it is possible to distinguish in each case the part which is beautiful or pleasurable from the part which is mechanical or merely useful. But as soon as we inquire further, and seek for more precise definitions, we find ourselves confronted with a mass of speculation and discussion as formidable as has been accumulated in any department of human thought. Granting that the fine arts are those of which the end is beauty, or beauty and use conjointly, the question next arises, what is beauty? and next, how does the beauty of art differ from the beauty of nature? and then, what place do the arts of beauty hold in the general scheme of things?—what are the relations of these activities and their results to the idea of the universe, to the faculties of man, and to each other? To such inquiries as these, enormous in extent and enormous in complexity, a separate place has been given in modern philosophy under the name Æsthetics. "It is the province of æsthetics," says Professor Ruskin, "to tell you (if you did not know it before) that the taste and color of a peach are pleasant, and to ascertain (if it be ascertainable, and you have any curiosity to know) why they are so." But in a less sarcastic and more extended definition, it would be said that the name Æsthetics is intended to designate a scientific doctrine or account of beauty in nature and art, and of the faculties for enjoying and for originating beauty which exist in man. Instead, however, of an accepted or uniform science, we find on these subjects a multitude of speculations as conflicting as they are voluminous; but yet conflicting more in appearance than in reality, because the source of their contradictions lies less in difference of judgment concerning the facts themselves, than in difference of doctrine concerning the abstract order of the universe in which those facts find a place, and in consequent diversity of method in arranging and of formula in interpreting the facts.

Plan of the present article.

Of the principal speculations of ÆSTHETICS the reader already possesses a synopsis under the proper heading. Our present task is of a different kind. We shall, indeed, as well as our space admits, endeavor to state what characters all the fine arts possess in common, and in what they severally differ from one another, as well as to lay down certain leading facts of their history; in other words, we shall submit (1) a definition of fine art in general, (2) a definition and classification of the fine arts severally, (3) some observations on their historical development. But in so doing, we shall not profess even to state the deeper problems either of metaphysics or psychology which will lie to right and left of our path, still less, as the exponents of any one philosophical system, to solve them. We shall simply take account of the facts and phenomena of the several arts as we find them in experience, and sum them up in the language of every day; keeping of necessity in view only the most salient features of the vast provinces of inquiry before us, and leaving particulars to be supplied under the headings of the individual arts. And when, as will sometimes happen, we do quote the formulas and refer to the systems of philosophers, it will be not as adopting any of them for better for worse, but as finding suggestions in all of them by turns; since, though one body of speculative doctrine may be no truer than another, yet each brings forward some aspect and contains some presentment of the truth; and a complicated mass of facts, when it is arranged in the order and expressed in the terms of a system, may not be essentially the clearer, but is usually the better marshalled for review.

---

[1] Hence called *cognizor;* the other party, the purchaser, is the *cognizee.*

Distinction between art and nature: premeditation essential to art.

At the threshold it will be necessary that we should call to mind the terms of our own definition of art in general (see ART). According to the popular distinction between art and nature, the idea of art only includes phenomena of which man is the cause—and that, when he acts not spontaneously, but with calculation, not from impulse, but from forethought; while the idea of nature includes all phenomena, both in man and in the world outside him, which take place without forethought or studied initiative of his own. This distinction we saw reason to recognize as practically valid. Art, we said accordingly, means every regulated operation or dexterity whereby we pursue ends which we know beforehand; and it means nothing but such operations and dexterities. That which any one does without thinking about it, and without considering what he is doing it for, is not art at all. Hence we shall not allow the title of fine art to natural eloquence, to charm or dignity of manner, to delicacy and tact in social intercourse, and other graces of life and conduct for which such a title is sometimes claimed, though they really proceed from an unconscious gift or unreflecting habit in those who exhibit them. All these are manifestations of the beautiful, and in witnessing them we experience a pleasure analogous, no doubt, to the pleasures of fine art. Nevertheless, so far as such manifestations are spontaneous, they are not arts, but, as we have called them, graces; they are due, as Greek theology would have expressed it, not to the teaching of Athênê but to the gift of the Charites. When the exigences of a deductive and ontological system lead a writer like Dr. Robert Zimmermann, of Vienna, to co-ordinate these spontaneous acts or traits of beautiful and expressive behavior with the deliberate artistic activities of the race, we feel that he is sacrificing to system a distinction which is essential. That distinction common parlance very justly observes, with its opposition of "art" to "nature," and its phrase of "second nature" for those habits which have become so ingrained as to seem spontaneous, whether originally the result of discipline or not. One of the essential qualities of art is premeditation; and when Shelley talks of the skylark's profuse strains of *unpremeditated art*, he in effect lays emphasis on the fact that it is only by a metaphor that he uses the word art in this case at all; he calls attention to that which (if the songs of birds are as instinctive as we suppose) precisely makes the difference between the skylark's outpourings and his own. For example, when we see a person in all whose ordinary movements there are freedom and beauty, we put down the charm of these to inherited and inbred physical aptitudes of which the person has never thought, and call it nature; but when we go on to notice that the same person is beautifully and appropriately dressed, since we know that it is impossible to dress without thinking of it, we put down the charm of this to judicious forethought and calculation, and call it art. Again, it is an established and a just practical maxim of the dramatic art, that the actor who, in the moment of performance really and involuntarily surrenders himself to the emotions of his part and situation, though he may rouse the sympathies of the audience by a natural exhibition of feeling, yet is not acting like an artist, and does not produce as much effect, nor an effect of the same kind, as he does when, master of himself, he goes through a series of utterances and gestures which he has deliberately conceived and rehearsed beforehand. The task of art is not, in either of the above instances, to create a product outside of or separate from the artist. The material upon which the artist has in these cases to work consists of his or her own natural aptitudes: aptitudes, in the one case, of personal charm, which have to be made the most of by appropriate adornment; aptitudes, in the other case, for mimicry and emotional expression, which have to be made the most of by study and practice. In such instances it may often be hard to separate the share of nature from the share of art in the result—to determine where grace ends and calculation begins, or where ends the sympathetic power of natural expression, and where begins the properly artistic power of studied and premeditated expression. Perhaps no writer has observed the differences or laid down the boundary-lines between these adjacent kingdoms of artlessness and art with more acuteness than Schleiermacher. But we have said enough to mark for the present purpose the reality and importance of the distinction. And having thus secured ourselves against the intrusion among fine arts of those phases of beauty in human act and utterance which justly belong not to art at all, but nature, we can enter upon what is our proper business, the delimitation of the separate place and functions of the fine arts among the rest of the arts and among each other.

I. OF FINE ART IN GENERAL.

The pleasures of fine art essentially a communicable order of pleasures.

When we say of the fine arts as a group that they are activities which minister to the love of beauty in man, it is as if we said the tailor's art is an activity which ministers to his need of clothes; and the inference is, in the one case as in the other, that a separate class of men is to be found in every community devoted to this particular employment. And such, practically, we all know to be the case; the gifts and calling of the artist constitute a separate profession, a profession of the producers, so to speak, of fine art, while the rest of the community are enjoyers or recipients of the fine art produced. In the most primitive societies, undoubtedly, this was not so, and we can go back to an original or rudimentary stage of every fine art at which the separation between a class of producers or performers, and a class of recipients, does not exist. Such an original or rudimentary stage of the dramatic art, for instance, we are accustomed to witness in children, who will occupy themselves at all moments with mimicry and make-believe for their own satisfaction, and without the least regard to the presence or absence of witnesses. The original or rudimentary type of the profession of imitative sculptors or painters is the cave-dweller of the palæolithic age, who, when he rested from his day's hunting, first took up the bone handle of his weapon, and with a flint either carved it into the shape, or on its surface scratched the outlines, of the animals of the chase. The original or rudimentary type of the architect, considered not as a mere builder, but as an artist, is the savage who, when his tribe had taken to live in tents or huts instead of caves, first arranged the skins and timbers of his tent or hut in one way because it pleased his eye, rather than in some other way which was as good for shelter. The original type of the artificer or maker of household implements, considered in the same light, was the other savage who first took it into his head to fashion his club or spear in one way rather than in another way as good for killing, and to ornament it with tufts or markings. In none of these cases had the primitive artist any reason for pleasing anybody but himself. Again, the original or rudimentary type of lyric song and dancing arose when the first reveller clapped hands and stamped or shouted in time, in honor of his god, in commemoration of a victory, or in mere obedience to the blind stirring of a rhythmic impulse within him; and to such a display the presence or absence of witnesses does not signify at all. The original type of the instrumental musician is the shepherd who first notched a reed and drew sounds from it while his sheep were cropping. The father of all artists in dress and personal adornment was the first wild man who tattooed himself or bedecked himself with shells and plumes. But in both of these last instances, it may be said, the primitive artist surely had the motive of pleasing not himself only, but his mate, or the female whom he desired to be his mate? However that may be, it is clear that what any one can enjoy by himself, whether in the way of musical sounds or personal adornments, or in the way of mimicry, of rhythmical movements, of imitative or ornamental carving and drawing, of the disposition and adornment of dwelling places and utensils—the same things, it is clear, others *can* also enjoy with him. For these and similar things to give pleasure, it is not essential that others should be by; but the pleasures they give are essentially of a kind in which others can, if they are by, participate.

Separation of the classes who produce and those who receive pleasures of fine art.

And so, with the growth of societies, it comes about that one class of persons separate themselves, and become the ministers or producers of this kind of pleasures, while the rest become the persons ministered to, the participators in or recipients of the pleasures. Artists are those members of a society who are so constituted as to feel more acutely than the rest certain classes of pleasures which all can feel in their degree. By this fact of their constitution they are impelled to devote their active powers to the production of such pleasures, to the making or doing of some of those things which they enjoy so intensely when they are made and done by others. At the same time the artist does not, by assuming these ministering or creative functions, surrender his enjoying or receptive functions. He continues to participate in the pleasures of which he is himself the cause, and remains a conscious member of his own public. The architect, sculptor, painter, are able respectively to stand off from and appreciate the results of their own labors; the singer enjoys the sound of his own voice, and the musician of his own instrument; the poet, according to his temperament, furnishes the most enthusiastic or the most fastidious reader for his own stanzas. Neither, on the other hand, does the person who is an habitual recipient from others of the pleasures of fine art, forfeit the privilege of producing them according to his capabilities, and of becoming, if he has the power, an amateur or occasional artist. Nay, these opposite functions of producing and enjoying the fruits of production, of ministering and being ministered to, are much more commonly combined in this than in other departments of human exertion. Nearly every one is ready to be the minister, if he can, of his own higher pleasures, and therefore to be his own singer or poet, his own architect, sculptor, or painter. Few are ready to be ministers of their own lower needs, and to be their own tailors, their own butchers (except in the case of wild game, the killing of which, being superfluous, possesses an attraction of which necessary killing is devoid), their own cobblers, cooks, servants, and the rest. In spite, however, of such combination or interchange of functions, we may, both practically and for the purposes of the present discussion, regard the artist as belonging generally to one category and the rest of the world to another. We may separate in our consideration those phenomena which attend the production of fine art, or exercise of the æsthetic activities, from those phenomena which attend the enjoyment of fine art, or contemplation of the results of such exercise.

Negative part of first definition to be followed up.

For the rest, of the two parts of which our preliminary definition consisted, we shall gain most by letting alone the one and following out the other. If we take up the affirmative part, in which we said that the fine arts are those which minister to our love of beauty, and if we try to develop and complete that, we shall have, for one thing, to explain how the love of beauty, in the wide and somewhat loose sense in which we here use the phrase, means a faculty which man possesses for taking keen and permanent delight in the contemplation and the imagination of many kinds of things, including some not strictly to be called beautiful, such as grotesqueness, comicality, even ugliness itself, when they are presented in typical forms. For another thing, we shall be very apt to find ourselves arguing in a circle, and saying, such and such an art is fine because it produces beauty, and such and such a thing is beautiful because it is produced by fine art. But if we take up the negative part of our definition, in which we only said that the fine arts are arts which exist independently of practical necessity or utility, and if we try to follow out this, we shall find that here we have got hold of a character of the fine arts which at once presents instructive aspects and far-reaching consequences. Indeed, the greater part of those other characters, or common properties of whatever kind, which have been recognized by consent as peculiar to the group of fine arts, will appear on examination to be implied in, or deducible from, this one fundamental character.

The pleasures of fine art are disinterested as well as communicable.

Let us take first, among such common properties, one relating to the frame of mind, or moral attitude, so to call it, which accompanies the reception as distinguished from the production of æsthetic pleasure. It is an observation as old as Aristotle that such pleasures differ from most other pleasures of experience in that they are disinterested. That is to say, of course not disinterested in the sense in which that word implies the positive ethical virtue of self-abnegation, or preferring others to one's self; but disinterested in the sense that they are not such as nourish a man's body nor add to his riches; they are not such as can gratify him, when he receives them, by the sense of advantage or superiority over his fellow creatures; they are not such as one human being can in any sense receive exclusively from the object which bestows them. We have partly learned as much already in glancing at the origins or rudimentary stages of the several fine arts, when we saw that, whether the primitive artist meant it or not, his operations were capable at any rate of pleasing others besides himself. To turn to their developed stages, it is evidently characteristic of a beautiful building that its beauty cannot be monopolized, but can be seen and admired by the inhabitants of a whole city and by all visitors for all generations. The same thing is true of a picture or a statue, except in so far as an individual possessor may choose to keep such a possession to himself, in which case his pride of monopoly is a sentiment wholly independent of his pleasure in artistic contemplation (and as a rule we practically find that the heir or collector who takes most pleasure in his treasures of art is also the readiest to make them accessible to others). Similarly, music is composed to be sung or played for the enjoyment of many at a time, and for such enjoyment a hundred years hence as much as to-day. Poetry is written to be read by all readers for ever who care for the ideas and feelings of the poet, and can apprehend the meaning and melody of his language. If we consider other pleasures which might seem to be analogous to those of fine art, but to which common consent yet declines to allow that character, we shall see that one reason is, that such pleasures are not in their nature thus disinterested. Thus the senses of smell and taste have pleasures of their own like the senses of sight and hearing, and pleasures neither less poignant nor very much less capable of fine graduation and discrimination than those. Why, then, are the experiences of these senses not called beautiful? and why is the title of fine art not claimed, or only claimed in jest, for any skill in arranging and combining them? Why are there no arts of savors and perfumes corresponding in rank to the arts of forms, colors, and sounds? An answer commonly given is that sight and hearing are intellectual and therefore higher senses, that through them we have our avenues to all knowledge and all ideas of things outside us; while taste and smell are unintellectual and therefore lower senses, through which few such impressions find their way to us as help to build up our knowledge and our ideas. To this it may be replied that music, in its perfect or developed state, the accomplished fine art, that is, of sounds, deals precisely with those modes and relations of sound, pure sound as apart from words, which least convey knowledge or definite ideas, and can so far at least be called intellectual. The reply is far from complete; still, a more satisfactory reason than the above why there are no fine arts of taste and smell, or at best but humble fine arts half ironically so called, is this, that savors and perfumes yield only private pleasures, which it is not possible to build up into separate and durable schemes such that every one may have the benefit of them, and such as cannot be monopolized or used up. If against this it is contended that what the programme of a performance is in the musical art, the same is a *menu* in the culinary, and that practically it is no less possible to serve up a thousand times and to a thousand different companies the same dinner than the same symphony, we must fall back upon that still more fundamental form of the distinction between the æsthetic and non æsthetic bodily senses, upon which the physiological psychologists of the English school lay stress. We must say that the pleasures of taste and smell cannot be æsthetic pleasures, or pleasures of fine art, because their enjoyment is too closely associated—in the case of taste inseparably—with the most indispensable and the most strictly personal of utilities, eating and drinking. To pass from these lower pleasures to the highest; consider the nature of the delight derived from the contemplation, by the person who is happy enough to be their object, of the signs and manifestations of love. That at least is a beautiful experience; why is the pleasure which it affords not an artistic pleasure either? Why, in order to receive an artistic pleasure from human signs and manifestations of this kind, are we compelled to go the theatre, and see them exhibited in favor of a third person, who is not really their object any more than ourselves? This is so, for one reason, evidently, because of that difference between art and nature on which we have already dwelt. Not to art, but to nature and life, belongs love where it is really felt, with its attendant train of hopes and fears, momentous passions and contingencies. To art belongs love displayed where it is not really felt; and in this sphere, along with reality and spontaneousness of the display, and along with its momentous bearings, there disappear all those elements of pleasure in its contemplation which, however exquisite, are not disinterested—the elements of personal exultation, of gratitude and self-congratulation, the pride of favor found, the delight of exclusive possession or acceptance, all these emotions, in short, which can be summed up in the lover's triumphant monosyllable, "Mine." Only when those personal emotions are absent can the properly æsthetic emotions or pleasures of fine art find place. That in witnessing a dramatic performance, part of the spectator's enjoyment consists in sympathetically identifying himself with the lover, may be true, but cannot affect the argument, since at the same time he is well aware that every other spectator present may be similarly engaged with himself.

This is because the arts are independent of utility.

Thus, from the lowest point of the scale to the highest, we may observe that the element of personal advantage or monopoly in human gratifications seems to exclude them from the kingdom of fine art. The pleasures of fine art seem to define themselves as pleasures of delighted contemplation, but of such contemplation only when it is disinterested. Now, the negative part of our first definition was that the fine arts were arts having nothing to do with the satisfaction of practical necessities or supply of practical utilities. So far as the necessity of anything implies its necessity to the sustenance or comfort of the individual apart from others, and so far as its utility implies its capacity of being used by one to the exclusion of others, our new observation, it is evident, does but confirm that first statement; repeating it as to a part of the ground which it covers, and drawing out a part of its consequences in the moral and social sphere.

The fine arts cannot be practised by rule and precept; this also is because they are independent of utility.

Next, let us consider another generally accepted observation concerning the nature of the fine arts, and one, this time, relating to the disposition and state of mind of the artist himself. The observation we mean is this, that while for success in other arts it is only necessary to learn their rules, and to apply them until practice gives facility, in the fine arts rules and their application will carry but a little way towards success. All that can depend on rules, on knowledge, and on the application of knowledge by practice, the artist must indeed acquire, and the acquisition is often very complicated and laborious. But outside of and beyond such acquisitions, he must trust to what is called genius or imagination, that is, to the spontaneous working together of an incalculably complex group of faculties, reminiscences, preferences, emotions, instincts, in his constitution. Now, if we consider this characteristic of the activities of the artist, we shall see that it is a direct consequence or corollary of the fundamental fact that the art he practises is independent of utility: thus. A useful end is necessarily a determinate and prescribed end. To every end which is determinate and prescribed there must be one road which is the best. Skill in any useful art means knowing practically, by rules and the application of rules, the best road to the particular ends of that art. Thus the farmer, the engineer, the carpenter, the builder so far as he is not concerned with the look of his buildings, the weaver so far as he is not concerned with the designing of the patterns which he weaves, these and the hundred other varieties of craftsmen or artificers in a community, possess each his separate skill, but a skill to which fixed problems are set, and which, if it indulges in new inventions and combinations at all, can indulge them only for the sake of an improved solution of those particular problems and no others. The solution once found, the invention once made, its rules can be written down, or at any rate its practice can be imparted to others, who will apply it in their turn. Whereas no man can write down, in a way that others can act upon in their turn, how Beethoven conquered unknown kingdoms in the world of harmony, and established new laws by the inspired violation of old; or how Rembrandt turned the aspects of spiritual abjectness and physical gloom into pictures as worthy of contemplation as those into which the Italians had for ages turned the aspects of spiritual exaltation and shadowless day. The reason why the operations of the artist thus differ from the operations of the ordinary craftsman or artificer is that his ends, being ends other than useful, are not determinate nor fixed as theirs are. He has large liberty to choose his own problems, and may solve each of them in a thousand different ways according to the prompting of his own ordering or creating instincts. The musical composer has the largest liberty of all. Having learned what is learnable in his art, having mastered the complicated and laborious rules of musical form, having next determined the particular class of the work which he is about to compose, he has then before him the whole inexhaustible world of appropriate successions and combinations of emotional sound. He is merely directed and not fettered, in the case of song, cantata, oratorio, or opera, by the sense of the words which he has to set. The poverty or splendor of the result depends absolutely on his possessing or failing to possess powers which can neither be trained in, nor communicated to, any man. And this double freedom, alike from practical service and from the representation of definite objects, is what makes music in a certain sense the typical fine art, or art of arts. Architecture shares one-half of this freedom. It has not to imitate natural objects; for this service it calls in sculpture to its aid; but architecture is without the other half of freedom altogether. The architect has a sphere of liberty in the disposition of his masses, lines, colors, alternations of light and shadow, of plain and ornamented surface, and the rest; but upon this sphere he can only enter on condition that he at the same time fulfils the strict practical task of supplying the required accommodation, and obeys the strict mechanical necessities imposed by the laws of weight, thrust, support, resistance, and other properties of solid matter. In the imitative arts, the sculptor, the painter, the poet, has each in like manner his sphere of necessary facts, rules, and conditions corresponding to the nature of his task. The sculptor must be intimately versed in the facts of the human frame and the rules and conditions for its representation in solid form; the painter in a much more extended range of natural facts and appearances, and the rules and conditions for representing them on a plane surface; the poet's art of words has its own not inconsiderable basis of positive and disciplined acquisition. So far as rules, precepts, measurements, and other communicable laws or secrets can carry the artist, so far also the spectator can account for, analyze, and, so to speak, tabulate the effects of his art. But the essential character of the artist's operation, its very bloom and virtue, lies in those parts of it which fall outside this range of regulation on the one hand and analysis on the other. His merit varies according to the felicity with which he is able, in that region, to exercise his free choice and frame his individual ideal, and according to the tenacity with which he strives to grasp and realize his choice, or to attain perfection according to that ideal. Of the amplitude of that freedom, of the complex and unsearchable secrets of that felicity, of the honorableness of that pursuit after perfection, men in general have expressed their consciousness when they have called these the fine or beautiful arts; thereby signifying not less their admiration of the nature of the operation than their pleasure in its results. Corresponding, then, to the fact, concerning the ends or purposes of the mechanical and the fine arts respectively, that those exist for use and these independently of use—we get the further fact, concerning the respective modes of their pursuit, that the mechanical arts can be rightly practised by strict adherence to rule and precept, while the fine arts, though they have technical foundations which are matters of rule and precept too, can yet be rightly practised only by following, in a region outside the reach of rule and precept, the free prompting of some of the finest faculties of the spirit.

Relative shares of art and mechanism in what are known as art-manufactures and art-industries.

In an age when the power and province of mechanical art are daily expanding, it is worth while in this connection to inquire in what way such expansion affects the power and province of fine art. The great practical movement of the world in our age is a movement for the development of mechanical inventions and multiplication of mechanical products. So far as these inventions are applied to purposes purely useful, and so far as their products do not profess to offer anything delightful to contemplation, this movement in no way concerns our argument. But there is a vast multitude of products which do profess qualities of pleasantness, and upon which the ornaments intended to make them pleasurable are bestowed by machinery, and in speaking of which we are accustomed to the phrases art-industry, industrial art, art-manufactures, and the like. It concerns us to know what relation the fine arts really hold to these. The answer is, that the industry or ingenuity which directs the machine is not fine art at all, since the object of the machine is simply to multiply as easily and as perfectly as possible a definite and prescribed impress or pattern. This is equally true whether the machine is a perfectly simple one, like the engraver's press, for producing and multiplying impressions from an engraved plate, or a highly complex one, like the loom, in which elaborate patterns of carpet or curtain are set for weaving. In both cases there exists behind the mechanical industry an industry which is one of fine art in its degree. In the case of the engraver's press, there exists behind the industry of the printer the art of the engraver, which, if the engraver is also the free inventor of the design, is then a fine art, or if he is but the interpreter of the invention of another, is then in its turn a semi-mechanical appliance in aid of the fine art of the first inventor. In the case of the weaver's loom there is, behind the mechanical industry which directs the loom at its given task, the fine art, or what ought to be the fine art, of the designer who has contrived the pattern. In the case of the engraving, the mechanical industry of printing only exists for the sake of bringing out and disseminating abroad the fine art employed upon the design. In the case of the carpet or curtain, the fine art is only called in to make the product of the useful or mechanical industry of the loom acceptable, since the eye of man is so constituted as to receive pleasure or the reverse of pleasure from whatever it rests upon, and it is to the interest of the manufacturer to have his product so made as to give pleasure if it can. Whether the machine is thus a humble servant to the artist, or the artist a kind of humble purveyor to the machine, the fine art in the result is due to the former alone; and in any case it reaches the recipient at second-hand, having been put in circulation by a medium not artistic but mechanical. So far, then, as the adoption of mechanical agencies causes an increasing number of people to buy the same print, or decorate their apartments with the same hangings, or wear the same pattern, where before each community or section of a community used products according to its individual taste and tradition, so far such adoption tends to reduce the number of first-hand artistic inventions, or total quantity of fine art, in the world. There is no greater mistake than to suppose that the expansion of what are called art-industries is necessarily tantamount to an increase or propagation of fine art; it is only tantamount to an increase or propagation of particular decorations mechanically multiplied; and is a thing desirable or not according as the decorations so multiplied replace something better or worse than themselves.

Again, with reference not to the application of mechanical contrivances but to their invention,—is not, it may be inquired, the title of artist due to the inventor of some of the astonishingly complex and astonishingly efficient machines of modern times? Does he not spend as much thought, labor, genius, as any sculptor or musician in perfecting his construction according to his ideal, and is not the construction when it is done—so finished, so responsive in all its parts, so almost human—is not that worthy of the name of fine art? Nay, we must reply, for the inventor has a definite and practical end before him; his ideal is not *free*; he deserves all credit as the perfector of a particular instrument for a prescribed function, but an artist, a free follower of the fine arts, he is not.

The fine arts a kind of play.

Lastly, let us consider one common observation more concerning the nature of the fine arts, though in effect it too does but affirm, in a somewhat new light, that negative definition on which we have dwelt so much already. The fine arts, it is said, are activities which men put forth, not because they need but because they like. They have the activity to spare, and to put it forth in this way pleases them. Fine art is to mankind what play is to the individual, a free and arbitrary vent for energy which is not needed to be spent upon tasks concerned with the conservation, perpetuation, or protection of life. To insist on the superfluous or optional character of the fine arts, to call them the play or pastime of the human race as distinguished from its inevitable and sterner tasks, is obviously only to reiterate our fundamental distinction between the fine arts and the useful or necessary. But the distinction, as expressed in this particular form, has been interpreted in a great variety of ways, and followed out to an infinity of conclusions, conclusions regarding both the nature of the activities themselves and the character and value of their results.

The English psychology of association.

For instance, starting from this saying that the æsthetic activities are a kind of play, the English psychology of association goes back to the spontaneous cries and movements of children, in which their superfluous energies find a vent. It then enumerates pleasures of which the human constitution is capable apart from direct advantage or utility. Such are the primitive or organic pleasures of sight and hearing, and the secondary or derivative pleasures of association or unconscious reminiscence and inference that soon become mixed up with these. Such are also the pleasures derived from following any kind of mimicry, or representation of things real or like reality. It describes the grouping within the mind of predilections based upon these pleasures; it shows how the growing organism learns to govern its play, or direct its superfluous energies, in obedience to such predilections, till in mature individuals, and still more in mature societies, a highly regulated and accomplished group of leisure activities are habitually employed in supplying to a not less highly cultivated group of disinterested sensibilities their appropriate artistic pleasures.

Again, in the views of an ancient philosopher, Plato, and a modern poet, Schiller, the consideration that the artistic activities are in the nature of play, and the manifestations in which they result independent of realities and utilities, has led to judgments so differing as the following.

Plato.

Plato held that the daily realities of things in experience are not realities indeed, but only far-off shows or reflections of the true realities, that is, of certain ideal or essential forms which can be apprehended as existing by the mind. Holding this, Plato saw in the works of fine art but the reflections of reflections, the shows of shows, and depreciated them according to their degree of remoteness from the ideal, typical, or sense-transcending existences. He sets the arts of medicine, agriculture, shoemaking, and the rest, above the fine arts, inasmuch as they produce something serious or useful (*σπουδαιόν τι.*) Fine art, he says, produces nothing useful, and makes only semblances (*εἰδωλοποιϊκή*), whereas what mechanical art produces are utilities, and even in the ordinary sense realities (*αὐτοποιητική*).

Schiller, and the theory of the *Spieltrieb.*

In another age, and thinking according to another system, Schiller, so far from holding thus cheap the kingdom of play and show, regarded his sovereignty over that kingdom as the noblest prerogative of man. Schiller wrote his famous *Letters on the Æsthetic Education of Man* in order to throw into popular currency, and at the same time to modify and follow up in a particular direction, certain systematic doctrines which had lately been launched upon the schools by Kant. The spirit of man, said Schiller after Kant, is placed between two worlds, the physical world or world of sense, and the moral world or world of will. Both of these are worlds of constraint or necessity. In the sensible world, the spirit of man submits to constraint from without; in the moral world, it imposes constraint from within. So far as man yields to the importunities of sense, in so far he is bound and passive, the mere subject of outward shocks and victim of irrational forces. So far as he asserts himself by the exercise of will, imposing upon sense and outward things the dominion of the moral law within him, in so far he is free and active, the rational lord of nature and not her slave. Corresponding to these two worlds, he has within him two conflicting impulses or impulsions of his nature, the one driving him towards one way of living, the other towards another. The one, or sense-impulsion, Schiller thinks of as that which enslaves the spirit of man as the victim of matter, the other or moral impulsion as that which enthrones it as the dictator of form. Between the two the conflict at first seems inveterate. The kingdom of brute nature and sense, the sphere of man's subjection and passivity, wages war against the kingdom of will and moral law, the sphere of his activity and control, and every conquest of the one is an encroachment upon the other. One of the two, it seems, must win. The man, it seems, must either be slave or master; he must either obey the impulsion of matter, and let sense and outward shocks lay upon him the constraint of nature, or he must obey the impulsion of form, and must control and subjugate sense under the constrait of moral reason and the will. Is there, then, no hope of truce between the two kingdoms, no ground where the two contending impulses can be reconciled? Must a man either abandon law and give way to sense absolutely, or else absolutely set up law and put down sense? Nay, the answer comes, there is such a hope; such a neutral territory there exists. Between the passive kingdom of matter and sense, where man is compelled to blindly feel and be, and the active kingdom of law and reason, where he is compelled sternly to will and act, there is a kingdom where both sense and will may have their way, and where man may give the rein to all his powers. But this middle kingdom does not lie in the sphere of practical life and conduct. In practical life and conduct you cannot yield to both impulsions at once; let yourself go, in that sphere, to the allurements of sense, and you cast off law; maintain law, and you mortify sense. It is in the sphere of those activities which neither subserve any necessity of nature, nor fulfil any moral duty, that the middle kingdom lies where sense and reason can be reconciled. Towards activities of this kind we are driven by a third impulsion of our nature not less essential to it than the other two, the impulsion, as Schiller calls it, of Play. Relatively to real life and conduct, play is a kind of harmless show; it is that which we are free to do or leave undone as we please, and which lies alike outside the sphere of needs and duties. In play we may do as we like, and no mischief will come of it. In this sphere man may put forth all his powers without risk of conflict, and may invent activities which will give a complete ideal satisfaction to the contending faculties of sense and will at once, to the impulses which bid him feel and enjoy the shocks of physical and outward things, and the impulse which bids him master such things, control, and regulate them. In play you may impose upon Matter what Form you choose, and the two will not interfere with one another or clash. The kingdom of Matter and the kingdom of Form thus harmonized, thus reconciled by the activities of play and show, will in other words be the kingdom of the Beautiful. Follow the impulsion of play, and to the beautiful you will find your road; the activities you will find yourself putting forth will be the activities of æsthetic creation—you will have discovered or invented the fine arts. "Midway," these are Schiller's own words, "midway between the formidable kingdom of natural forces and the hallowed kingdom of moral laws, the impulse of æsthetic creation builds up a third kingdom unperceived, the gladsome kingdom of play and show, wherein it emancipates man from all compulsion alike of physical and of moral forces." Schiller, the poet and enthusiast, thus making his own application of the Kantian metaphysics, goes on to set forth how the fine arts, or activities of play and show, are for him the typical, the ideal activities of the race, since in them alone is it possible for man to put forth his whole, that is his ideal self. "Only when he plays is man really and truly man." "Man ought only to play with the beautiful, and he ought to play with the beautiful only." "Education in taste and beauty has for its object to train up in the utmost attainable harmony the whole sum of the powers both of sense and spirit." And the rest of Schiller's argument is addressed to show how the activities of artistic creation, once invented, quickly react upon other departments of human life, how the exercise of the play impulse prepares men for an existence in which the inevitable collision of the two other impulses shall be softened or averted more and more. That harmony of the powers which clash so violently in man's primitive nature, having first been found possible in the sphere of the fine arts, reflects itself, in his judgment, upon the whole composition of man, and attunes him, as an æsthetic being, into new capabilities for the conduct of his social existence.

Merits and demerits of the theory of Schiller.

Our reasons for dwelling on this wide and enthusiastic formula of Schiller's are both its importance in the history of reflection—it produced, indeed, so great an impression that it may still be called a formula almost classical—and its positive value. The notion of a sphere of voluntary activity for the human spirit, in which, under no compulsion of necessity or conscience, we order matters as we like them apart from any practical end, seems at least co-extensive with the widest conception of fine art and the fine arts. It insists on and brings into the light the essential point of the free, or as we have called it, the optional character of these activities, as distinguished from others to which we are compelled by necessity or duty. It also insists on and brings into the light what is no less essential, the fact that these activities, superfluous as they are from the points of view of necessity and of duty, spring nevertheless from an imperious and a saving instinct of our nature. It does justice to the part which is, or at any rate may be, filled in the world by pleasures which are apart from profit, and by delights for the enjoyment of which men cannot quarrel. It claims the dignity they deserve for those shows and pastimes in which we have found a way to make permanent all the transitory delights of life and nature, to turn our very tears and yearnings, by their artistic utterance, into sources of appeasing joy, to make amends to ourselves for the confusion and imperfection of reality by conceiving and imaging forth the semblances of things clearer and more complete, since in contriving them we incorporate with the experiences we have had the better experiences we have dreamed of and longed for.

Schiller's theory may thus be no explanation of the essential nature and place in the universe of these activities and their results; it will certainly be none for those to whom the Kantian doctrine of metaphysical opposition between the senses and the reason has no meaning. Neither can his particular application of that doctrine, with its terminology of *Stofftrieb*, *Formtrieb*, and *Spieltrieb*, the three impulses, or impulsions, of Matter, Form, and Play, be considered altogether happy. Nevertheless the theory furnishes us with a suggestive approach to a working definition, and has remained a fruitful one for many minds independently of the metaphysical doctrines upon which it was based. Its great fault is that, though it asserts that man man ought only to play with the beautiful, and that he is his best or ideal self only when he does so, yet it does not sufficiently determine what kinds of play are beautiful nor why we are moved to adopt them. It does not sufficiently show how the delights of the eye and spirit in contemplating forms, colors, and movements, of the ear and spirit in apprehending musical and verbal sounds, or of the whole mind at once in following the comprehensive current of images called up by poetry—it does not sufficiently show how delights like these differ from those yielded by other kinds of play or pastime, and between them make up the whole kingdom of artistic pleasures.

Pleasures of fine art compared with those of the chase, athletics, etc.

The chase, for instance, is a play or pastime which gives scope for any amount of premeditated skill; it has pleasures, for those who take part in it, which are in some degree analogous to the pleasures of the artist; and we all know the claims made on behalf of the noble art of venerie by the knights and woodmen of Walter Scott's romances. But here we must remember that, though the chase is play to us, who in civilized communities follow it on no plea of necessity, yet to a not remote ancestry it was earnest; in primitive societies hunting does not belong to the class of optional activities at all, but is among the most pressing of utilitarian needs. And this character of its origin and history might exclude it from the class of fine arts, even if there were not the further fact that the pleasures of the sportsman are the only pleasures arising from the chase; his exertions afford pain to the victim, and no satisfaction to any class of recipients but himself; or at least the pleasures of the bystanders at a meet or a battue are hardly to be counted as pleasures of artistic contemplation. Again, it may be said that such a theory does not sufficiently exclude from among the fine arts the class of athletic games or sports, not connected with the chase, though these do afford pleasure to multitudes, and most communities, especially our own, are accustomed to devote to them much trained skill and a large portion of their leisure activity. Here the difference is, that the event which excites the spectator's interest and pleasure at a race or athletic contest is not a wholly unreal or simulated event; true, it is less real than life, but it is more real than art. The contest has not, indeed, any momentous practical consequences, but it is a contest in which competitors put forth real strength, and one really wins, and others are defeated. Such a contest, in which the exertions are real and the issue uncertain, we follow with an excitement and an expectancy which are different in kind from the feelings with which we contemplate any fictitious representation of which the issues are arranged beforehand. For example, let the reader recall the feelings with which he has watched a real fencing bout, and compare them with those with which he watches the simulated fencing bout in Hamlet. The instance is a crucial one, because the simulated contest is made infinitely more exciting than such contests in general by the introduction of the poisoned foil, and by the tremendous consequences which we are aware will turn, in the representation, on the issue. Yet because the fencing scene in Hamlet *is* a representation, and not real, we find ourselves watching it in a mood wholly different from that in which we watch the most ordinary real fencing-match with vizors and blunt foils; a mood much more exalted, if the representation is good, but amid the æsthetic emotions of which those other fluctuations of direct, even if trivial, excitement, of participation, approval, disappointment, suspense, eagerness, find no place. Again, of athletics in general, they are pursuits to a considerable degree definitely utilitarian, having for their specific end the training and strengthening of the human body. Here, however, our argument touches ground which is not free from debate; inasmuch as in some systems the title of fine arts has been consistently claimed, if not for athletics technically so-called, and involving the idea of competition and defeat, at any rate for gymnastics, regarded simply as a display of the physical frame of man cultivated by exercise—as, for instance, it was cultivated by the ancient Greeks—to an ideal perfection of beauty and strength.

General definition.

Divesting the view of Schiller, then of the Kantian metaphysic, and adding to it those provisions on which, in the course of our argument, we have seen the necessity of laying stress, we might put the matter thus. There are some things which we do because we must; those are our necessities. There are other things which we do because we ought; those are our duties. There are other things which we do because we like; those are our play. *Among the various kinds of things done by men only because they like, the fine arts are those of which the results afford to many permanent and disinterested delight, and of which the performance, calling for premeditated skill, is capable of regulation up to a certain point, but, that point passed, has secrets beyond the reach and a freedom beyond the restraint of rules.* We believe that this definition or description, avoiding barren controversy concerning the nature of beauty, will be found both to state the limits of the group of undisputed fine arts, and to enunciate some of its chief characteristics.

II. Of the Fine Arts severally.

Architecture, sculpture, painting, music, and poetry are by common consent the five principal or greater fine arts.

Modes in which the five greater arts have been classified.

It is possible in thought to group these five arts in as many different orders as there are among them different kinds of relation or affinity. One thinker fixes his attention upon one kind of relations as the most important, and arranges his group accordingly; another upon another; and each, when he has done so, is very prone to claim for his arrangement the virtue of being the sole essentially and fundamentally true. For example, we may ascertain one kind of relations between the arts by inquiring which is the simplest or most limited in its effects, which next simplest, which less simple still, which least simple or most complex of them all. This, the relation of progressive complexity or comprehensiveness between the fine arts, is the relation upon which an influential thinker of recent times, Auguste Comte, has fixed his attention, and it yields in his judgment the following order:—Architecture lowest in complexity, both because of the kinds of effects which it produces, and the material conditions and limitations under which it works; sculpture next; painting third; then music; and poetry highest, as the most complex or comprehensive art of all, both in its own special effects and in its resources for ideally calling up the effects of all the other arts, as well as all the phenomena of nature and experiences of life. A somewhat similar grouping was adopted, though from the consideration of a wholly different set of relations, by Hegel. Hegel fixed his attention on the varying relations borne by the idea, or spiritual element, to the embodiment of the idea, or material element, in each art. Leaving aside that part of his doctrine which concerns, not the phenomena of the arts themselves, but their place in the dialectical world-plan, or scheme of the universe—Hegel said in effect something like this. In certain ages and among certain races, as in Egypt and Assyria, and again in the Gothic age of Europe, mankind has only dim ideas for art to express, ideas insufficiently disengaged and realized, of which the expression cannot be complete or lucid, but only adumbrated and imperfect; the characteristic art of those ages is a symbolic art, with its material element predominating over and keeping down its spiritual, and such a symbolic art is architecture. In other ages, as in the Greek age, the ideas of men have come to be definite, disengaged, and clear; the characteristic art of such an age will be one in which the spiritual and material elements are in equilibrium, and neither predominates over or keeps down the other, but a perfectly distinct idea is expressed in a perfectly adequate form; this is the mode of expression called classic, and the classic art is sculpture. In other ages, again, and such are the modern ages of Europe, the idea grows in power and becomes importunate; the spiritual and material elements are no longer in equilibrium, but the spiritual element predominates; the characteristic arts of such an age will be those in which thought, passion, sentiment, aspiration, emotion, emerge in freedom, dealing with material form as masters, or declining its shackles altogether; this is the romantic mode of expression, and the romantic arts are painting, music, and poetry. Next let us take another point of view, and turn our attention, with one of the acutest of recent critics of æsthetic systems, Dr. Hermann Lotze, to the relative degrees of freedom or independence which the several arts enjoy—their freedom, that is, from the necessity of either imitating given facts of nature or ministering, as part of their task, to given practical uses. In this grouping, instead of the order architecture, sculpture, painting, music, poetry—music will come first, because it has neither to imitate any natural facts nor to serve any practical end; architecture next, because though it is tied to useful ends and material conditions, yet it is free from the task of imitation, and pleases the eye in its degree, by pure form, light and shade, and the rest, as music pleases the ear by pure sound; then, as arts all tied to the task of imitation, sculpture, painting, and poetry, taken in progressive order according to the progressing comprehensiveness of their several resources.

Place of the lesser or auxiliary arts among the rest.

Again, besides the enumeration of the five greater fine arts, which is fixed, and their classification, which is thus unfixed and variable, the thinker on these subjects has to consider the enumeration and classification of the lesser or subordinate fine arts. Whole clusters or families of these occur to the mind at once; such as acting, an art auxiliary to poetry, but quite different in kind; dancing, an art not auxiliary but subordinate to music, from which in kind it differs no less; eloquence in all kinds, so far as it is studied and not merely spontaneous; and among the arts which fashion or dispose material objects, embroidery and the weaving of patterns, pottery, glassmaking, goldsmith's work, and jewelry, joiner's work, gardening, according to the claim of some, and a score of other dexterities and industries which are more than mere dexterities and industries because they add elements of beauty and pleasure to elements of serviceableness and use. To decide whether any given one of these has a right to the title of fine art, and if so, to which of the greater fine arts it should be thought of as appended and subordinate, or between which two of them intermediate, is often no easy task.

No one classification sufficient.

The weak point of all classifications of the kind of which we have above given examples is that each is intended to be final, and to serve instead of any other. The truth is, that the relations between the several fine arts are much too complex for any single classification to bear this character. Every classification of the fine arts must necessarily be provisional, according to the particular class of relations which it keeps in view. And for practical purposes it is requisite to bear in mind not one classification but several. Fixing our attention not upon complicated or problematical relations between the various arts, but only upon their simple and undisputed relations, and giving the first place in our consideration to the five greater arts of architecture, sculpture, painting, music, and poetry, we shall find at least three principal modes in which every fine art either resembles or differs from the rest.

First classification—the shaping and speaking arts.

1. *The Shaping and the Speaking Arts.*—Each art either makes something, or does not make anything, that can be seen and handled. The arts which make something that can be seen and handled are architecture, sculpture, and painting. In the products or results of all these arts external matter is in some way or another manually put together, fashioned, or disposed. But music and poetry do not produce any results of this kind. What music produces is something that can be heard, and what poetry produces is something that can be either heard or read—which last is a kind of ideal hearing, having for its avenue the eye instead of the ear, and for its material, written signs for words instead of the spoken words themselves. Now what the eye sees from any one point of view, it sees all at once; in other words, the parts of anything we see fill or occupy not time but space, and reach us from various points in space at a single simultaneous perception. If we are at the proper distance we see at one glance the whole height and breadth of a house from the ground to the chimneys, the whole of a statue from head to foot, and in a picture at once the foreground and background, and everything that is within the four corners of the frame. On the other hand, the parts of anything we hear, or, reading, can imagine that we hear, fill or occupy not space but time, and reach us from various points in time through a continuous series of perceptions, or, in the case of reading, of images raised by words in the mind. We have to wait, in music, while one note follows another in a bar, and one bar another in an air, and one air another in a movement; and in poetry, while one line with its images follows another in a stanza, and one stanza another in a canto, and so on. It is a convenient form of expressing both aspects of this difference between the two groups of arts, to say that architecture, sculpture, and painting are arts which give shape to things in space, or more briefly, shaping arts; and music and poetry arts which give utterance to things in time, or more briefly, speaking arts. These simple terms of the *shaping* and the *speaking* arts are not usual in English; but they seem appropriate and clear, and we shall adopt them for denoting the distinction we are now considering between the group that work in space, architecture, sculpture, and painting, and the group that work in time, music and poetry. (The distinction is best expressed in the German *bildende* and *redende Künste;* for which the words *manual* and *vocal,* or else *formative,* or *plastic,* and *rhetorical,* are sometimes used, not too happily, in English.) This is practically, if not logically, the most substantial and vital distinction upon which a classification of the fine arts can be based. The arts which surround us in space with stationary effects for the eye, as the house we live in, the picture on the walls, the marble figure in the vestibule, are stationary, hold a different kind of place in our experience—not a greater or a higher place, but essentially a different place—from the arts which provide us with transitory effects in time, effects capable of being awakened for the ear or mind at any moment, as a symphony is awakened by playing and an ode by reading, but lying in abeyance until we bid that moment come, and passing away when the performance or the reading is over. Such, indeed, is the practical force of the distinction that in modern usage the expression *fine art,* or even *art,* is often used by itself in a sense which tacitly excludes music and poetry, and signifies the group of manual or shaping arts alone.

Intermediate class of arts of motion.

As between any two of the five greater arts, the distinction on which we are now dwelling is sharp and absolute. Buildings, statues, pictures, belong absolutely to sight and space; to time and to hearing, real through the ear, or ideal through the mind in reading, belong absolutely music and poetry. Among the lesser or subordinate arts, however, there are several in which this distinction finds no place, and which produce, in space and time at once, effects midway between the stationary or stable, and the transitory or fleeting. Such, first of all, is the dramatic art, in which the actor makes with his actions and gestures, or several actors make with the combination of their different actions and gestures, a kind of shifting picture, which appeals to the eyes of the witnesses while the sung or spoken words of the drama appeal to their ears; thus making of them spectators and auditors at once, and associating with the pure time-art of words the mixed time-and-space art of bodily movements. As all *movement* whatsoever is necessarily movement through space, and takes time to happen, so every other fine art which is wholly or in part an art of movement partakes in like manner of this double character. Along with acting thus comes dancing. Dancing, when it is of the mimic character, may itself be a kind of acting, and is, whether apart from or in conjunction with this mimic element, at any rate an art in which bodily movements obey, accompany, and as it were accentuate in space the time effects of music. Eloquence or oratory in like manner, so far as its power depends on studied and premeditated gesture, is also an art which to some extent enforces its primary appeal through the ear in time by a secondary appeal through the eye in space. So much for the first distinction, that between the shaping or space-arts and the speaking or time-arts, with the intermediate and subordinate class of arts which, like acting, dancing, oratory, add to the pure time element a mixed time-and-space element. These can hardly be called shaping arts, because it is his own person, and not anything outside himself, which the actor, the dancer, the orator disposes or adjusts; they may perhaps best be called arts of motion, or moving arts. We must postpone further description of the functions of the several fine arts until we have taken account of the second great principle of classification among them, which is as follows:—

Second classification—the imitative and non-imitative arts.

2. *The Imitative and the Non-imitative Arts.*—Each art either represents or imitates something, or does not represent or imitate anything, which exists already in nature. Of the five greater fine arts, those which thus represent objects existing in nature, are sculpture, painting, and poetry. Those which do not represent anything so existing are music and architecture. So that on this principle we get a different grouping from that which we got on the principle last explained. Two space-arts and one time-art now form the imitative group of sculpture, painting, and poetry; while one space-art and one time-art form the non-imitative group of music and architecture. The mixed space-and-time arts of the actor, and of the dancer so far as he or she is also a mimic, belong of course, by their very name and nature, to the imitative class.

The imitative functions of the arts according to Aristotle.

It was this imitative character of the arts which chiefly occupied the attention of Aristotle. But Aristotle had not realized that there existed, along with the great group of imitative arts, another group strictly non-imitative. In his mind the idea of imitation or representation (mimêsis) was extended so as to denote the expressing, uttering, or making manifest of anything whatever. Music and dancing, by which utterance or expression is given to emotions that may be quite detached from all definite ideas or images, are thus for him varieties of imitation. He says, indeed, *most* music and dancing, as if he was aware that there were exceptions, but he does not indicate what the exceptions are; and under the head of imitative music, he distinctly reckons some kinds of instrumental music without words. But in our own more precise usage, to imitate is necessarily to imitate some individual thing, some definite reality of experience; and we can only call those imitative arts which tell us of such things, either by showing us their actual likeness, as sculpture does in solid form, and as painting does by means of lines and colors on a plane surface, or else by calling up ideas or images of them in the mind, as poetry and literature do by means of words. It is by a stretch of ordinary usage that we apply the word imitation even to this last way of representing things; since words are no true likeness of, but only arbitrary signs for, the thing they represent. And those arts we cannot call imitative at all which by indefinite utterance or expression produce in us emotions unattended by the recognizable likeness, idea, or image of anything.

Non-imitative character of music.

Now the emotions of music, when music goes along with words, whether in the shape of actual song, or even of the instrumental accompaniment of song, are no doubt in a certain sense attended with definite ideas. But the ideas then in question are the ideas expressed by the words themselves; and the same ideas would be conveyed to the mind equally well by the same words if they were not sung or accompanied, but simply spoken. What the music contributes is a special element of its own, an element of pure emotion which heightens the effect of the words upon the feelings, without in the least helping to elucidate them for the understanding. Nay, it is well known that a song produces its intended effect upon the feelings almost as well though we fail to catch the words or are ignorant of the language to which they belong. Thus the view of Aristotle cannot be defended on the ground that he was familiar with music only in an elementary form, and principally as the direct accompaniment of words, and that in his day the modern development of the art, as an art for building up immense constructions of independent sound, glorious and intricate fabrics of melody and harmony detached from words, was a thing neither imagined nor imaginable. That is perfectly true; but the essential character of musical sound is the same in its most elementary as in its most complicated stage. Its privilege is to give delight, not by communicating definite ideas, or calling up particular images, but by expressing on the one part, and arousing on the other, a unique kind of emotion. The emotion caused by music may be altogether independent of any ideas conveyable by words. Or it may serve to intensify and enforce other emotions arising at the same time in connection with the ideas conveyed by words; and a distinguished composer and energetic musical reformer of our own day insists that in the former phase the art is now exhausted, and that only in the latter are new conquests in store for it. But in either case the music is the music, and *is like nothing else;* it is no representation or similitude of anything whatsoever.

Objections to the above; and the reply.

But does not instrumental music really, it may be urged, sometimes imitate the sounds of nature, as the piping of birds, the whispering of woods, the moaning of storms, or very explosion of the thunder; or does it not at any rate suggest these things by resemblances so close that they almost amount to imitation? Occasionally, it is true, music does allow itself these playful excursions into a region of quasi-imitation or mimicry. It modifies the character of its abstract sounds into something, so to speak, more concrete, and, instead of sensations which are like nothing else, affords us sensations which recognizably resemble those we receive from some of the sounds of nature. But such excursions are hazardous, and to make them often is the surest proof of vulgarity in a musician. Neither are those effects of the great composers in accompanying the verbal descriptions of natural phenomena, which we recognize as most appropriate to the phenomena described, generally in the nature of real imitations or representations of them. The notes of the dove and nightingale in Haydn's *Creation* must be acknowledged to be instances of true though highly idealized imitation; but in such other instances of direct, obvious, and suggestive appropriateness of the music to the words as even the "Hailstone" chorus and the "Darkness" chorus of the *Israel in Egypt*, the music in no true sense imitates the phenomena, or *shows us how* fire mingled with the hail ran along upon the ground, or how there came over all the land of Egypt thick darkness—even a darkness which might be felt. Again, it is an acknowledged fact concerning the operation of instrumental music on its hearers, that all hearers will find themselves in tolerable agreement as to the meaning of any passage so long as they only attempt to describe it in terms of vague emotion, and to say, such and such a passage expresses, as the case may be, dejection or triumph, effort or the relaxation of effort, eagerness or languor, suspense or fruition, anguish or glee. But their agreement comes to an end the moment they begin to associate, in their interpretation, definite ideas with these vague emotions; then we find that what suggests in idea to one hearer the vicissitudes of war will suggest to another, or to the same at another time, the vicissitudes of love, to another those of spiritual yearning and aspiration, to another, it may be, those of changeful travel by forest, champaign, and ocean, to another those of life's practical struggle and ambition. The infinite variety of the ideas which may thus be called up in different minds by the same strain of music is proof enough that the music is not like any particular thing. The torrent of entrancing emotion which it pours along the heart, emotion latent and undivined until the spell of sound begins, that is music's achievement and its secret; the ideas which may spring up in attendance on the emotion are no more than as the rainbow colors which come and go in the torrent spray.

It is perhaps hardly necessary to add, that the latest physiological explanation of the source of music's power within us in no way shakes or interferes with this fundamental character of the art. According to that explanation, the charm of musical sounds depends on susceptibilities which have gone on accumulating in the fibres of the human constitution, by hereditary transmission through uncounted generations, ever since our brute progenitors found favor with their mates by wooing them (as other brutes are known to woo theirs now) with love-cries which in their regulated time and pitch contained the rudimentary elements of music. If this explanation is true, that does not of course mean that the musical utterance of to-day is any copy or imitation of those aboriginal love-cries; only that it is an infinitely complex and remote development of faculties which had in them their earliest exercise.

Definition of music.

Aristotle endeavored to frame a classification of the arts, in their several applications and developments, on two grounds—the nature of the objects imitated by each, and the means or instruments employed in the imitation. But in the case of music the first part of this endeavor falls to the ground, because the object imitated has, in truth, no existence. The means employed by music are successions and combinations of vocal or instrumental sounds regulated according to the three conditions of time or interval, tone or pitch (which together make up melody), and harmony, or the relations of different strains of time and tone co-operant but not parallel. With these means, music either creates her independent constructions, or else accompanies, adorns, enforces, the imitative art of speech—but herself imitates not; and may best be defined simply as *a speaking art, of which the business is to utter and arouse emotion by successions and combinations of regulated sound.*

Non-imitative character of architecture. Analogies of architecture and music.

That which music is thus among the speaking or time-arts, architecture is among the shaping or space-arts. As music appeals to our faculties for taking pleasure in non-imitative combinations of transitory sound, so architecture appeals to our faculties for taking pleasure in non-imitative combinations of stationary mass. Corresponding to the system of ear-effects or combinations of time, tone, and harmony with which music works, architecture works with a system of eye-effects or combinations of line, light and shade, color, proportion, interval, alternation of plane and decorated parts, regularity and variety in regularity, apparent stability, vastness, appropriateness, and the rest. Such pleasures of the eye and ear, depending on abstract relations of sounds in time and sights in space, and not all on concrete imitation, are one half of those disinterested pleasures of which we are capable, and which the play impulse within us finds out and turns to account. Only, the materials of architecture are not volatile and intangible like sound, but solid brick, stone, metal, and mortar, and the laws of weight and force according to which these materials have to be combined are much more severe and cramping than the laws of melody and harmony which regulate the combinations of music. The architect is further subject up to a certain point, which the musician is not, to the dictates and precise prescriptions of utility. Hence the effects of architecture are necessarily less full of various, rapturous, and unforeseen enchantment than the effects of music. Yet for those who possess sensibility (which many persons without knowing it completely lack) to the pleasures of the eye and the perfections of shaping art, the architecture of the great ages has yielded combinations which, so far as comparison is permissible between things unlike in their materials, fall no whit short of the achievements of music in those kinds of excellence which are common to them both. Thus in the virtues of lucidity, of just proportion and organic interdependence of the several parts or members, in exquisite subtlety of their mutual relations, and of the transitions from one part or member to another, in consummate purity and consummate finish of individual forms, in the character of one thing growing naturally out of another and everything serving to complete the whole—in all these qualities, no musical combination can surpass a typical Doric temple such as the Hecatompedon at Athens. None, again, can surpass the great cathedrals of the Middle Age in the qualities of sublimity, of complexity, in the power both of expressing and suggesting spiritual aspiration, in the invention of intricate developments and ramifications about a central plan, in the union of greatness and majesty in the main conception with inexhaustible fertility of adornment in detail. In fancifulness, in the unexpected, in capricious opulence and far-sought splendor, in filling the mind with mingled enchantments of East and West and South and North, none can surpass a building like St. Mark's at Venice, with its blending of Byzantine elements, Italian elements, Gothic elements, each carried to the utmost pitch of elaboration and each enriched with a hundred caprices of ornament, but all working together, all in obedience to a law, and "all beginning and ending with the Cross." It would be tempting to carry further, and into more particular applications, the parallel between the space-effects of architecture and the time-effects of music. But we must be content with having indicated it here. It is no fanciful similitude, but constitutes, so to speak, the positive aspect of that affinity between music and architecture, of which we bring forward the negative aspect only when we separate these two arts, as being non-imitative, from the imitative arts of sculpture, painting, and poetry.

Exceptions and limitations to the above.

In the case of architecture, however, as in the case of music, this non-imitative character must not be stated quite without exception or reserve. There have been styles of architecture in which forms suggesting or imitating natural or other phenomena have held a place among the abstract forms proper to the art. Often the mode of such suggestions is rather symbolical to the mind than really imitative to the eye; as when the number and relations of the heavenly planets were imaged in the seven concentric walls of their great temple, and in many other architectural constructions, by that race of astronomers the Babylonians; or as when the shape of the cross was adopted, with innumerable slight varieties and modifications, for the ground plan of the churches of Christendom. Passing to examples of imitation more properly so called, it may be true, and was at any rate long believed, that the aisles of Gothic churches had reference to or were inspired by the aspect of the natural forest aisles amid which they rose, and that the upsoaring forest trunks and meeting branches were imaged in their piers and vaultings. In the temple-palaces of Egypt, one of the regular architectural members, the sustaining pier, is often systematically wrought in the actual likeness of a conventionalized cluster of lotus stems, with lotus flowers for the capitals. When we come to the fashion, not rare in Greek architecture, of carving this same sustaining member, the column, in complete human likeness, and employing Caryatids, Canephori, Atlases, or the like, to carry the architrave of a building, it then becomes difficult to say whether we have to do with the work of architecture or of sculpture. The case, at any rate, is different from that in which the sculptor is called in to supply surface decoration to the various members of a building, or to fill with the products of his own art spaces in the building specially contrived and left vacant for that purpose. When the imitative feature is in itself an indispensable member of the architectural construction, to architecture rather than sculpture (not that such niceties of appropriation are important) we shall probably do best to assign it.

Definition of architecture.

Defining architecture, then (apart from its utility, which for the present we leave out of consideration), as *a shaping art, of which the function is to arouse emotion by combinations of ordered and decorated mass,* we pass from the characteristics of the non-imitative to those of the imitative group of arts.

The imitative arts.

The second half of the disinterested pleasures of which we are capable, and which the play impulse finds out and turns to account in us, are the pleasures afforded by imitation, that is, by the showing of shows or the telling of stories which bring before us things like what we know in reality. In the consideration of the arts which minister to these pleasures, we cannot do better than follow that Aristotelian division to which we have already alluded, and which describes each art according, first, to the objects it imitates, and secondly, to the means or instruments it employs.

Sculpture and its varieties.

Sculpture, then, may have for its objects of imitation the shapes of whatever things possess length, breadth, and magnitude. For its means or instruments it has solid form, which the sculptor either carves out of a hard substance, as in the case of wood and stone, or models in a yielding substance, as in the case of clay and wax, or casts in a dissolved or molten substance, as in the case of plaster and of metal in certain uses, or beats, draws, or chases in a malleable and ductile substance, as in the case of metal in other uses, or stamps from dies or moulds, a method sometimes used in all soft or fusible materials. Thus a statue or statuette may either be carved straight out of a block of stone or wood, or first modelled in clay or wax, then moulded in plaster or some equivalent material, and then carved in stone or cast in bronze. A gem is wrought in stone by cutting and grinding. Figures in jeweller's work are wrought by beating and chasing; a medallion by beating and chasing or else by stamping from a die; a coin by stamping from a die; and so forth. The process of modelling (Greek πλάττειν) in a soft substance being regarded as the typical process of the sculptor, the name *plastic art* has been given to his operations in general.

Sculpture in the round and in relief.

In general terms, the task of sculpture is to imitate solid form with solid form. But sculptured form may be either completely or incompletely solid. Sculpture in completely solid form exactly reproduces, whether on the original or on a different scale, the relations or proportions of the object imitated in the three dimensions of length, breadth, and depth or thickness. Sculpture in incompletely solid form reproduces the proportions of the objects with exactness only so far as concerns two of its dimensions, namely those of length and breadth; while the third dimension, that of depth or thickness, it reproduces in a diminished proportion, leaving it to the eye to infer, from the partial degree of projection given to the work, the full projection of the object imitated. The former, or completely solid kind of sculpture, is called sculpture in the round; its works stand free, and can be walked round and seen from all points. The latter, or incompletely solid kind of sculpture, is called sculpture in relief; its works do not stand free, but are engaged in or attached to a background, and can only be seen from in front. According, in the latter kind of sculpture, to its degree of projection from the background, a work is said to be in high or in low relief. Sculpture in the round and sculpture in relief are alike in this, that the properties of objects which they imitate are their outlines, or the boundaries and circumscriptions of their masses, and their light and shade—the lights and shadows, that is, which diversify the curved surfaces of the masses in consequence of their alternations and gradations of projection and recession. But the two kinds of sculpture differ in this. A work of sculpture in the round imitates the whole of the outlines of any given object, and presents to the eye, as the object itself would do, a new outline succeeding the last every moment as you walk round it. Whereas a work of sculpture in relief imitates only one outline of any object; it takes, so to speak, a section of the object as seen from a particular point, and traces on the background the boundary-line of that particular section; merely suggesting, by modelling the surface within such boundary according to a regular, but a diminished, ratio of projection, the other outlines which the object would present if seen from all sides successively.

Subjects proper for sculpture in the round.

As sculpture in the round reproduces the real relations of a solid object in space, it follows, that the only kind of object which it can reproduce with pleasurable effect must be one not too vast or complicated, one that can afford to be detached and isolated from its surroundings, and of which all the parts can easily be perceived and apprehended in their organic relations. Further, it will need to be an object interesting enough to mankind in general to make them take delight in seeing it reproduced with all its parts in complete imitation. And again, it must be such that some considerable part of the interest lies in those particular properties of outline and light and shade which it is the special function of sculpture to reproduce. Thus a sculptured representation in the round, say, of a mountain with cities on it, would hardly be a sculpture at all; it could only be a model, and as a model might have value; but value as a work of fine art it could not have, because the object imitated would lack organic definiteness and completeness; it would lack universality of interest, and of the interest which it did possess, a very inconsiderable part indeed would depend upon its properties of outline and light and shade. Obviously there is no kind of object in the world that so well unites the required conditions for pleasurable imitation in sculpture as the human body. It is at once the most complete of organisms, and the shape of all others the most subtle as well as the most intelligible in its outlines; the most habitually detached in active or stationary freedom; the most interesting to mankind, because its own; the richest in those particular effects, contours and modulations, contrasts, harmonies, and transitions of modelled surface and circumscribing line, which it is the prerogative of sculpture to imitate. Accordingly the object of imitation for this art is pre-eminently the body of man or woman. That it has not been for the sake of representing men and women as such, but for the sake of representing gods in the likeness of men and women, that the human form has been most enthusiastically studied, does not affect this fact in the theory of the art, though it is a consideration of great importance in its history. Besides the human form, sculpture may imitate the forms of those of the lower animals whose physical endowments have something of a kindred perfection, with other natural or artificial objects as may be needed merely by way of accessory or symbol. The body must for the purposes of this art be divested of covering, or covered only with such tissues as reveal, translate, or play about without concealing it. Only in lands and ages where climate and social use have given the sculptor the opportunity of studying human forms so draped or undraped has this art attained perfection, or become exemplary and enviable to that of other races.

Subjects proper for sculpture in relief.

Relief sculpture is more closely connected with architecture than the other kind, and indeed is commonly used in subordination to it. But if its task is thus somewhat different from that of sculpture in the round, its principal objects of imitation are the same. The human body remains the principal theme of the sculptor in relief; but the nature of his art allows, and sometimes compels, him to include other objects in the range of his imitation. As he has not to represent the real depth or projection of things, but only to suggest them according to a ratio which he may fix himself, so he can introduce into the third or depth dimension, thus arbitrarily reduced, a multitude of objects for which the sculptor in the round, having to observe the real ratio of the three dimensions, has no room. He can place one figure in slightly raised outline emerging from behind the more fully raised outline of another, and by the same system can add to his representation rocks, trees, nay mountains and cities, and birds on the wing.

Relief sculpture tends to merge into drawing on the one hand and architecture on the other.

But the more he uses this liberty, the less will he be truly a sculptor. Solid modelling, and real light and shade, are the special means or instruments of effect which the sculptor alone among imitative artists enjoys. Single outlines and contours, the choice of one particular section and the tracing of its circumscription, are means which the sculptor enjoys in common with the painter or draughtsman. And indeed, when we consider works executed wholly or in part in very low relief, whether Assyrian battle-pieces and hunting-pieces in alabaster or bronze, or the backgrounds carved in bronze, marble, or wood by the Italian sculptors who followed the example set by Ghiberti at the Renaissance, we shall see that the principle of such work is not the principle of sculpture at all. Its effect depends not at all on qualities of surface-light and shadow, but exclusively on qualities of contour, as traced by a slight line of shadow on the side away from the light, and a slight line of light on the side next to it. And we may fairly hesitate whether we shall rank the artist who works on this principle, which is properly a *graphic* rather than a *plastic* principle, among sculptors or among draughtsmen. The above are cases in which the relief sculptor exercises his liberty in the introduction of other objects besides human figures into his sculptured compositions. But there is another kind of relief sculpture in which the artist has less choice. That is the kind in which the sculptor is called in to decorate with carved work parts of an architectural construction which are not adapted for the introduction of figure subjects, or for their introduction only as features in a scheme of ornament that comprises many other elements. To this head belongs most of the carving of capitals, mouldings, friezes (except the friezes of Greek temples), bands, cornices, and in the Gothic style, of doorway arches, niches, canopies, pinnacles, brackets, spandrils, and the thousand members and parts of members which that style so exquisitely adorned with true or conventionalized imitations of natural forms. This is no doubt a subordinate function of the art; and it is impossible, as we have seen already, to find a precise line of demarcation between carving, in this decorative use, which is properly sculpture, and that which belongs properly to architecture.

Definition of sculpture.

Leaving such discussions, we may content ourselves with the definition of sculpture as *a shaping art, of which the business is to imitate natural objects, and principally the human body, by reproducing in solid form either their true proportions in all dimensions, or else their true proportions in the two dimensions of length and breadth only, with a diminished proportion in the third dimension of depth or thickness.*

Nature and methods of painting.

In considering bas-relief as a form of sculpture, we have found ourselves approaching the confines of the second of the shaping-imitative arts, the graphic art, or art of painting. Painting, as to its means or instruments of imitation, dispenses with the third dimension altogether. It imitates natural objects by representing them as they are represented on the retina of the eye itself, simply as an assemblage of lines and colors on a flat surface. The character and disposition of the lines and colors in painting are determined by two things, the local colors of the objects themselves, and their shapes and positions in space. Painting does not reproduce the third dimension of reality by any third dimension of its own whatever; but leaves the eye to infer the solidity, the recession and projection, the nearness and remoteness of objects, by the same perspective signs by which it also infers those facts in nature—namely, by the direction of their several boundary lines, the incidence and distribution of their lights and shadows, the strength or faintness of their tones of color. Hence this art has an infinitely greater range and freedom than any form of sculpture. Near and far is all the same to it, and whatever comes into the field of vision can come also into the field of a picture; trees as well as personages, and clouds as well as trees, and stars as well as clouds; and on earth the remotest mountain snows as well as the violet of the foreground, and far-off multitudes of people as well as one or two near the eye. Whatever any man has seen, or can imagine himself as seeing, that he can also fix by painting, subject only to one great limitation,—that of the range of brightness which he is able to attain in imitating natural color illuminated by light. In this particular his art can but correspond according to a greatly diminished ratio with the effects of nature. But excepting this, it can do for the eye almost all that nature herself does; or at least all that nature would do if man had only one eye; since the three dimensions of space produce upon our binocular machinery of vision a particular stereoscopic effect of which a picture, with its two dimensions only, is incapable. The range of the art being thus almost unbounded, its selections have naturally been dictated by the varying interest felt in this or that subject of representation by the societies among whom the art has at various times been practised. As in sculpture, so in painting, man, whether as figuring God, or for the sake of his own looks and doings, has always held the first place. For the painter, the intervention of costume between man and his environment is not a misfortune in the same degree as it is for the sculptor. For him, clothes of whatever fashion or density have their own charm; they serve to diversify the aspect of the world, and to express the characters and stations, if not the physical frames, of his personages; and he is as happy or happier among the brocades of Venice as among the bare limbs of the Spartan palæstra. Along with man, there come into painting all animals and vegetation, all man's furniture and belongings, his dwelling-places, fields and landscape; and in modern times also landscape and nature for their own sakes, skies, seas, mountains, and wildernesses apart from man.

Three modes of imitating nature in painting.

Besides the two questions about any art, what objects does it imitate, and by the use of what means or instruments, Aristotle proposes (in the case of poetry) the further question, which of several possible forms does the imitation in any given case assume? We may transfer very nearly the same inquiry to painting, and may ask, concerning any painter, according to which of three possible systems he works. The three possible systems are (1) that which attends principally to the configuration and relations of natural objects as indicated by their circumscribing lines—this may be called for short the system of line; (2) that which attends chiefly to their configuration and relations, as indicated by the incidence and distribution of their lights and shadows—this may be called the system of light-and-shade; and (3) that which attends chiefly, not to their configuration at all, but to the distribution, qualities, and relations of colors upon their surface—this is the system of color. Line, light-and-shade, and color, these three kinds of appearances between them make up the whole world of sight. (We do not pause to insist on the fact that line is in truth partly an invention of the mind; those divisions between objects which the painter or draughtsman indicates with an outline or dark marking being in nature only indicated by the even edge where one color ends and another begins.) It is not possible for a painter to imitate natural objects to the eye at all without either defining their masses by outlines, or suggesting them by juxtapositions of light and dark or of local colors. In the complete art of painting, of course, all three methods are employed at once. But in what is known as outline drawing and outline engraving, one of the three methods only is employed, line; in *grisaille* pictures, and in shaded drawings and engravings, two only, line with light-and-shade; and in the shadowless pictures of the early religious schools, a different two only, line with color. And even in the most accomplished examples of the complete art of painting, as has been justly pointed out by Professor Ruskin, we find that there almost always prevails a predilection for some one of these three parts of painting over the other two. Thus among the mature Italians of the Renaissance, Titian is above all things a painter in color, Michelangelo in line, and Leonardo in light-and-shade.

Completeness not the test of value in a pictorial imitation.

The value of a pictorial imitation is by no means necessarily in proportion to its completeness. Many accomplished pictures, in which all the resources of line, color, and light-and-shade have been used to the uttermost of the artist's power for the imitation of all that he could see in nature, are worthless in comparison with a few faintly-touched outlines or lightly-laid shadows or tints of another artist who could see nature better. The fine art of painting addresses not merely the eye but the imagination. Unless the painter knows how to choose and combine the elements of his finished work so that it shall contain in every part suggestions and delights over and above the mere imitation, it will fall short, in that which is the essential charm of fine art, not only of any scrap of a great master's handiwork, such as an outline sketch of a child by Raphael, or a color sketch of a boat or a mackerel by Turner, but even of any scrap of the merest journeyman's handiwork produced by an artistic race, such as the first Japanese drawing for children in which a water-flag and king-fisher, or a spray of peach or almond blossom across the sky, is dashed in with a mere hint of color, but a hint that tells a whole tale to the imagination. This, however, is an order of considerations belonging rather to particular criticism than to general classification.

Technical varieties of painting.

It remains to consider, for the purposes of our classification, what are the technical varieties of the painter's craft. Since we gave the generic name of painting to all imitation of natural objects by the assemblage of lines, colors, and lights and darks on a single plane, we must include, as varieties of painting, not only the ordinary crafts of spreading or laying pictures on an opaque surface in fresco, oil, or water-color, but also the craft of arranging a picture to be seen by the transmission of light through a transparent substance, in glass painting; the craft of fitting together a multitude of solid cubes or cylinders so that their united surface forms a picture to the eye, in mosaic; the craft of spreading vitreous colors in a state of fusion so that they form a picture when hardened, as in enamel; and even, it would seem, the crafts of tapestry and embroidery, since these also yield to the eye a plane surface figured in imitation of nature. As drawing we must also count incised or engraved work of all kinds representing merely the outlines of objects and not their modellings, as for instance the mythological subjects incised upon the bronze mirrors and dressing-cases of Etruscan ladies; while raised work in low relief, in which outlines are plainly marked and modellings neglected, furnishes, as we have seen, a doubtful class between sculpture and painting. In all figures that are first modelled in the solid and then variously colored, sculpture and painting bear a common part; as for instance when the sculptor Praxiteles handed his finished statue to the painter Nicias to receive its *circumlitio* or tinting. But as the special characteristic of sculpture, the third dimension, is here present, it is to that art and not to painting that we shall still ascribe the resulting work. The system of more or less highly coloring stone statues, that is, of *painting sculpture*, which the moderns have disused, prevailed alike in the Greek and Gothic ages; and solid form and local color have been similarly combined in the productions of pottery in all ages, from those of Corinth and Tanagra down to those of Dresden and Sèvres.

Definition of painting.

With these indications, which the reader can easily follow up for himself, we may leave the art of painting defined in general terms as a *shaping art, of which the business is to imitate all kinds of natural objects by reproducing on a plane surface the relations of their boundary lines, lights and shadows, or colors, or all three of these appearances together.*

Nature and methods of poetry.

The next and last of the imitative arts is the speaking art of poetry. The transition from sculpture and painting to poetry is, from the point of view not of our present but of our first division among the fine arts, abrupt and absolute. It is a transition from space into time, from the sphere of material forms to the sphere of immaterial images. This is not the place for any detailed exposition of the principles of poetry. But for the sake of the due co-ordination of this art in our general scheme, we are bound as briefly as we can to state its functions among the rest. In so doing we will again adopt the several heads of description with which the reader is already familiar from Aristotle. The objects of poetry's imitation, then, we shall define as everything of which the idea or image can be called up by words, that is, every force and phenomenon of nature, every operation and result of art, every fact of life and history, or every imagination of such a fact, every thought and feeling of the human spirit, for which mankind in the course of its long evolution has been able to create in speech an explicit and appropriate sign. The means or instruments of poetry's imitation are these verbal signs or words, arranged in lines, strophes, or stanzas, so that their sounds have some of the regulated qualities of music. The three chief modes or forms of the imitation may still be defined as they were defined by Aristotle himself. First comes the epic or narrative form, in which the poet speaks alternately for himself and his characters, now describing their situations and feelings in his own words, and anon making each of them speak in the first person for himself. Second comes the lyric form, in which the poet speaks in his own name exclusively, and gives expression to sentiments which are purely personal. Third comes the dramatic form, in which the poet does not speak for himself at all, but only puts into the mouths of each of his personages successively such discourse as he thinks appropriate to the part. The last of these three forms of poetry, the dramatic, calls, if it is merely read, on the imagination of the reader to fill up those circumstances of situation, action, and the rest which in the first or epic form are supplied by the narrative between the speeches, and for which in the lyric or personal form there is no occasion. To avoid making this call upon the imagination, to bring home its effects in full reality, dramatic poetry has to call in the aid of several subordinate arts, the shaping or space art of the scene-painter, the mixed time and space arts of the actor and the dancer. Occasionally also, or in the case of opera throughout, dramatic poetry heightens the emotional effect of its words with music. A play or drama is thus, as performed upon the theatre, not a poem merely, but a poem accompanied, interpreted, completed, and brought several degrees nearer to reality by a combination of auxiliary effects of the other arts. Besides the narrative, the lyric, and dramatic forms of poetry, the didactic, that is, the teaching or expository form, has usually been recognized as a fourth. Aristotle refused so to recognize it, regarding a didactic poem in the light not so much of a poem as of a treatise. But from the *Works and Days* down to the *Loves of the Plants* there has been too much literature produced in this form for us to follow Aristotle here. We shall do better to regard didactic poetry as a variety corresponding, among the speaking arts, to architecture and the other manual arts of which the first purpose is use, but which are capable of accompanying and adorning use by a pleasurable appeal to the emotions.

Definition of poetry.

We shall hardly make our definition of poetry, considered as an imitative art, too extended if we say that it is *a speaking art, of which the business is to represent by means of verbal signs arranged with musical regularity everything for which verbal signs have been invented.*

Neither the varieties of poetical form, however, nor the modes in which the several forms have been mixed up and interchanged—as such mixture and interchange are implied, for instance, by the very title of a group of Mr. Browning's poems, the *Dramatic Lyrics,*—the observation of neither of these things concerns us here so much as the observation of the relations of poetry in general, as an art of representation or imitation, to the other arts of imitation, painting and sculpture.

Analogies and contrasts between the three imitative arts.

Verbal signs have been invented for innumerable things which cannot be imitated or represented at all either in solid form or upon a colored surface. You cannot carve or paint a sigh, or the feeling which finds utterance in a sigh; you can only suggest the idea of the feeling, and that in a somewhat imperfect and uncertain way, by representing the physical aspect of a person in the act of breathing the sigh. Similarly you cannot carve or paint any movement, but only figures or groups in which the movement is represented as arrested in some particular point of time; nor any abstract idea, but only figures or groups in which the abstract idea, as for example release, captivity, mercy, is illustrated in the concrete shape of allegory. The whole field of thought, of propositions, arguments, injunctions, and exhortations, is open to poetry, but closed to sculpture and painting. Poetry, by its command over the regions of the understanding, of abstraction, of the movement and succession of things in time, by its power of instantaneously associating one delightful image with another from the remotest regions of the mind, by its names for every shade of feeling and experience, exercises a sovereignty a hundred times more extended than that of either of the two arts of manual imitation. But on the other hand, words do not as a rule bear any sensible resemblance to the things of which they are the signs. There are few things that words do not stand for or cannot call up; but they stand for things, as it were, only at second hand, and call them up only in idea, and not in actual presentment to the senses. And just in this lies the strength of painting and sculpture, that though there are countless things which they cannot represent at all, and countless more which they can only represent by suggestion more or less ambiguous, yet there are a few things which they represent more effectually and directly than poetry can represent anything at all. These are, for sculpture, the forms or configurations of things, which that art represents directly to the senses both of sight and touch; and for painting the forms or configurations, colors, and relative positions of things, which the art represents to the sense of sight, directly so far as regards surface appearances, and indirectly so far as regards solidity. For many delicate qualities and differences in these visible relations of things, there are no words at all—the vocabulary of colors, for instance, is in all languages surprisingly scanty and primitive. And those visible qualities for which words exist, the words still call up indistinctly and at second hand. Poetry is almost as powerless to bring before the mind's eye with precision a particular shade of red or blue, as sculpture is to relate a continuous experience, or painting to enforce an exhortation or embellish an abstract proposition. The wise poet, as has been justly remarked, when he wants to produce a vivid impression of the beauty of a visible thing, does not attempt to catalogue or describe its stationary beauties. In representing the perfections of form in a bride's slender foot, the speaking art, poetry, would find itself distanced by either of the shaping arts, painting or sculpture; the wise poet calls up the charm of such a foot by describing it not at rest but in motion, and in the feet which

> "Beneath the petticoat,
> Like little mice, went in and out,"

leaves us an image which baffles the power of the other arts. Shakespeare, when he wants to make us realize the perfections of Perdita, puts into the mouth of Florizel, not, as a bad poet would have done, a description of her lilies and carnations, and the other charms which a painter could make us realize better, but the praises of her ways and movements; and with the final touch—

> "When you do dance, I wish you
> A wave o' the sea, that you might ever do
> Nothing but that,"

he leaves upon the mind a twofold image of beauty in motion, of which one-half might be the despair of those painters who designed the dancing maidens of the walls of Herculaneum, and the other half the despair of all artists who in modern times have tried to fix upon their canvas the buoyancy and grace of dancing waves.

Law of their relations.

The difference between the means and capacities of representation proper to the shaping arts of sculpture and painting, and those proper to the speaking art of poetry, which we have unsystematically glanced at in the above, were for a long while overlooked or misunderstood. The maxim of Simonides, that poetry was a kind of articulate painting, and painting a kind of mute poetry, was vaguely accepted until the days of Lessing, and first overthrown by the famous treatise of that writer on the Laocoön. Following in the main the lines laid down by Lessing, other writers have worked out the conditions of representation or imitation proper, not only to sculpture and painting as distinguished from poetry, but to sculpture as distinguished from painting, until there is perhaps no part of artistic theory so well or so generally understood as this. The chief points, with some of which we have become acquainted already, may really all be condensed under the simple law, *that the more direct and complete the imitation effected by any art, the less is the range and number of phenomena which that art can imitate.* Thus sculpture in the round imitates its objects much more completely and fully than any other single art, reproducing one whole set of their relations which no other art attempts to reproduce at all, namely, their solid relations in space. Precisely for this reason, such sculpture is limited to a narrow class of objects. As we have seen, it must represent human or animal figures; nothing else has enough of organic beauty and perfection, or enough of universal interest. It must represent such figures in combinations and with accessories comparatively simple, on pain of puzzling and embarrassing the eye with a complexity and entanglement of masses and lights and shadows; and in attitudes comparatively quiet, on pain of violating, or appearing to violate, the conditions of mechanical stability. Being a stationary or space-art, it can only represent a single action, which it fixes and perpetuates for ever; and it must therefore choose for that action one as significant and full of interest as is consistent with due observation of the above laws of simplicity and stability. Such actions, and the facial expressions accompanying them, must not be those of sharp crisis or transition, because sudden movement or flitting expression, thus arrested and perpetuated in full and solid imitation by bronze or marble, would be displeasing and not pleasing to the spectator. They must be actions and expressions in some degree settled, collected, and capable of continuance, and in their collectedness must at the same time suggest to the spectator as much as possible of the circumstances which have led up to them and those which will next ensue. These conditions evidently bring within a very narrow range the phenomena with which this art can deal, and explain why, as a matter of fact, by far the greater number of statues represent simply a single figure in repose, with the addition of one or two symbolic or customary attributes. Paint the statue and you bring the imitation to a still further point of completeness by the addition of local color; but you do not thereby lighten in any degree the restrictions which are inevitably laid upon sculpture so long as it undertakes to reproduce in full the third or solid dimension of bodies. You only begin to lighten its restrictions when you begin to relieve it of that duty. We have traced how sculpture in relief, which is satisfied with only a partial reproduction of the third dimension, is free to introduce a larger range of objects, bringing forward secondary figures and accessories, indicating distant planes, indulging even in some violence and complexity of motion, since limbs attached to a background do not alarm the spectator by any idea of danger or fragility; though for the due effect of the work, and the pleasurable distinctness and diversity of its lights and shadows, such complexity must not, even in relief, be carried too far. And so by degrees we arrive at painting, in which the third dimension is dismissed altogether, and nothing is actually reproduced, in full or partially, except the effect made by the appearance of natural objects upon the retina of the eye. The consequence is that this art can range over distance and multitude, can represent complicated relations between its various figures and groups of figures, extensive backgrounds, and all those subtleties of appearance in natural things which depend upon local color and incidence of light and shade. These last phenomena of natural things are in our experience subject to change, in a sense in which the substantial or solid properties of things are not so subject. Colors, shadows, and atmospheric effects are to some extent associated with ideas of transition, mystery, and evanescence. Hence painting is able to extend its range to another kind of facts over which sculpture has no power. It can perpetuate in its imitation, without breach of its true laws, certain classes of facts which are themselves fugitive and transitory, as a smile, the glance of an eye, a gesture of horror or of passion, the waving of the young Achilles' hair "not unstirred," as the old description has it, by the wind, the toss and gathering of ocean waves, even the flashing of lightning across the sky. Still, any long or continuous series of changes, actions, or movements is quite beyond the means of this art to represent. Painting remains, in spite of its comparative width of range, tied down to the inevitable conditions of a space-art: that is to say, it has to delight the mind by a harmonious variety in its effects, but by a variety apprehended not through various points of time successively, but from various points in space at the same moment. Lastly, a really ample range is only attained by the art which does not give a full and complete reproduction of any natural fact at all, but represents or brings natural facts before the mind merely by the images which words convey. The whole world of movement, of continuity, of cause and effect, of the successions, alternations, and interaction of events, characters, and passions, of everything that takes time to happen and time to declare, is open to poetry as it is open to no other art. We speak only of those parts of poetry which may properly be called its imitative or representative parts, and not of its other parts or applications, in reasoning, in exhortation, in denunciation, and the like. As an imitative or representative art, then, poetry is subject to no limitations except those which spring from the poverty of human language, and from the fact that its means of imitation are indirect. Poetry's report of the visible properties of things is from these causes much less full, accurate, and efficient than the reproduction or delineation of the same properties by sculpture and painting. And this is the sum of the conditions concerning the respective functions of the three arts of imitation which had been overlooked, in theory at least, until the time of Lessing.

The acted drama no exception to this law.

To this law, in the form in which we have expressed it, it may perhaps be objected that the acted drama is at once the most full and complete reproduction of nature which we owe to the fine arts, and that at the same time the number of facts over which its imitation ranges is the greatest. The answer is that our law applies to the several arts only in that which we may call their pure or unmixed state. Dramatic poetry is in that state only when it is read or spoken like any other kind of verse. When it is witnessed on the stage, it is in a mixed or impure state; the art of the actor has been called in to give actual reproduction to the gestures and utterances of the personages, that of the costumier to their appearances and attire, that of the stage-decorator to their furniture and surroundings, that of the scene-painter to imitate to the eye the dwelling-places and landscapes among which they move; and only by the combination of all these subordinate arts does the drama gain its character of imitative completeness or reality.

Things unknown shadowed forth by imitation of things known.

Throughout the above account of the imitative and non-imitative groups of fine arts, we have so far followed Aristotle as to give the name of imitation to all recognizable representation whatever of realities. By realities we have meant not only phenomena as they actually or literally exist, or may have existed in the past. Imitation, as we understand it, is not tied to such strict veracity of positive delineation or report. It includes the representation of things which, though similar to things actually existing, have themselves never actually existed—the invention of phenomena, and of relations and combinations among phenomena, derived from those of actual experience, but not identical with them. Such shadowing forth of the unknown by means of the known is part of the work of that comprehensive faculty which we call the imagination. But the materials or elements with which the imaginative faculty is at liberty thus to deal are materials or elements supplied by real experience. When we find among the ruins of a Greek temple the statue of a beautiful young man at rest, or above the altar of a Christian church the painting of one transfixed with arrows, we know that the statue is intended to bring to our minds no mortal youth, but the god Hermes or Apollo, the transfixed victim no simple captive, but Sebastian the holy saint. At the same time we none the less know that the figures in either case have been studied by the artist from living models before his eyes. In like manner, in all the representations alike of sculpture, painting, and poetry, the things and persons represented may bear symbolic meanings and imaginary names and characters; they may be set in a land of dreams, and grouped in relations and circumstances upon which the sun of this world never shone—and such in truth was the purpose to which the arts were almost universally put until but the other day; but it is from real things and persons that their lineaments and characters have been taken in the first instance, in order to be attributed by the imagination to another and more exalted order of existences.

Imitation by art necessarily an idealized imitation.

The law which we have last laid down is a law defining the relations of sculpture, painting, and poetry, considered simply as arts having their foundations at any rate in reality, and drawing from the imitation of reality their indispensable elements and materials. It is a law defining the range and character of the elements or materials in nature which each art is best fitted, by its special means and resources, to imitate. But we must remember that, even in this fundamental part of its operations, none of these arts proceeds by imitation pure and simple. None of them contents itself with seeking to represent realities, however literally taken, exactly as those realities are. A portrait in sculpture or painting, a landscape in painting, a passage of local description in poetry, may be representations of known things taken literally or for their own sakes, and not for the sake of carrying our thoughts to the unknown; but none of them ought to be, or indeed can possibly be, a representation of all the observed parts and details of such a reality on equal terms and without omissions. Such a representation, were it possible, would be a mechanical inventory and not a work of fine art. That only, we know, is fine art which affords keen and permanent delight to contemplation. Such delight the artist can never communicate by the display of a callous and pedantic impartiality in presence of the facts of life and nature. His delineation or report of realities will only strike or impress others in so far as it directs their attention to things by which he has been struck and impressed himself. To excite emotion, he must have felt emotion; and emotion is only another word for partiality. The constitution which observes and registers every detail of an experience with uniform and equal minuteness is a constitution which has been strongly affected by no part of that experience. Such a constitution will never make an artist. The ulterior imaginative meanings and combinations of art being left out of the question, the artist is one who instinctively tends to modify and work upon every reality before him in conformity with some poignant and sensitive principle of preference or selection in his mind. He instinctively adds something to nature in one direction and takes away something in another, overlooking this kind of fact and insisting on that, suppressing many particulars which he holds irrelevant in order to insist on and bring into prominence others by which he is attracted and arrested. To do this is called to idealize, and the faculty by which an artist prefers, selects, and brings into the light one order of facts or aspects in the thing before him rather than the rest, is called the idealizing or ideal faculty. To the definitions of the imitative arts above given, in which we said that their business was to imitate natural facts,—one by solid form, another by line, light-and-shade, and color, a third by words in regulated combination,—to these definitions, then, we must now add that the imitation of natural fact in question is not an imitation pure and simple, but an *idealized imitation*, in which the mind acts upon the facts of nature, and sifts and sorts them at its choice, before it represents or puts them on record.

Nature of the idealizing process.

This idealizing faculty is also one of that great cluster of faculties or powers within us for mentally making the most of the world we live in, which are commonly associated together under the comprehensive name imagination. Interminable discussion has been spent on the questions,—What is the ideal, and how do we idealize? The answer has been put in the most sensible form by those thinkers (*e.g.*, Vischer and Lotze) who have pointed out that the process of æsthetic idealization carried on by the artist is only the higher development of a process carried on in an elementary fashion by all men, from the very nature of their constitution. The physical organs of sense themselves do not retain or put on record all the impressions made upon them. When the nerves of the eye receive a multitude of different stimulations at once from different points in space, the sense of eyesight, instead of being aware of all these stimulations singly, only abstracts and retains a total impression of them together. In like manner we are not made aware by the sense of hearing of all the several waves of sound that strike in a momentary succession upon the nerves of the ear; that sense only abstracts and retains a total impression from the combined effect of a number of such waves. And the office which each sense thus performs singly for its own impressions, the mind performs in a higher degree for the impressions of all the senses equally, and for all the other parts of our experience. We are always dismissing or neglecting a great part of our impressions, and abstracting and combining among those which we retain. The ordinary human consciousness works like an artist up to this point; and when we speak of the ordinary or inartistic man as being impartial in the retention or registry of his daily impressions, we mean, of course, in the retention or registry of his impressions as already thus far abstracted and assorted in consciousness. The artistic man, whose impressions affect him much more strongly, carries much farther these same processes of abstraction and combination among his impressions, and according to the complexion of his feelings imparts a color from his own mind both to the literal record of his experiences and to the imaginary constructions which he builds upon them.

Subjective and objective ideals.

It will further help our understanding of what is meant by the ideal in art, if we observe that into the framing of every ideal there enter two parts or elements. These are, a subjective and an objective part or element—or so we may for convenience call them. The artist, affected more than other men by his daily impressions, grows up with certain innate or acquired predilections which become a part of his constitution whether he will or no,—predilections, say, if he is a dramatic poet, for certain types of character and situation; if he is a sculptor, for certain proportions and a certain habitual carriage and disposition of the limbs; if he is a figure painter, for certain moulds of figure and airs and expressions of countenance; if a landscape painter, for a certain class of character, configuration, and sentiment in natural scenery. This is the subjective or purely personal part of the artistic ideal. But on the other hand, as an imitator of fact, the artist has to recognize and accept the character of the facts which he finds at any given moment before him. All facts cannot be of the cast which he prefers, and in so far as he undertakes to deal with facts of an opposite cast he must submit to them; he must study them as they actually are, must abstract, retain, bring into prominence, and carry out their own dominant tendencies. If he cannot find in them what is most pleasing to himself, he will still be led by the abstracting and discriminating powers of his observation to discern what is most significant in *them*, he will emphasize and put on record this, idealizing the facts before him not in his direction but in their own. This, the disengaging and bringing forward of the characteristics actually dominant in any object as he finds it, is the second or objective half of the artist's task of idealization. It is this half upon which M. Taine has dwelt almost exclusively, and on the whole with a just insight into the principles of the operation, in his well-known treatise *On the Ideal in Art*. These two modes of idealization, the subjective and the objective, are not always easy to be reconciled. Though the perfect artist would no doubt be he who should combine the strongest personal instincts of preference with the keenest power of observing characteristics as they are, yet in fact we find few artists in whom both these elements of the ideal faculty have been equally developed. To take some familiar instances among painters: Leonardo da Vinci, haunted as he was above all men by a particular human ideal of intellectual sweetness and alluring mystery, which perpetually recurs in the faces of his women and young men, has yet left us a vast number of exercises which show him as an indefatigable student of objective characteristics and pyschological expressions of an order the most opposed to this. An older painter of the same period, Sandro Botticelli, is on the other hand as good an example as can be named of an artist who could never escape from the dictation of his own personal ideals, in obedience to which he invested all the creations of his art with nearly the same conformation of brows, lips, cheeks, and chin, nearly the same looks of wistful yearning and dejection. If, again, we desire an example of the opposite principle, of that idealism which idealizes above all things objectively, and disengages the very inmost and individual characters, however unattractive or unseemly, of the thing or person before it, we must turn to the northern schools, and especially to the work of Rembrandt; though, indeed, that master's profound sense of human sympathy and commiseration, and his predilection for a certain class of light-and shade effects, throw in this case, too, a veil of distinct personal feeling over his representations.

The imitative arts depend partly on non-imitative elements.

Sculpture, painting, and poetry, then, are arts which represent things known and real, either for their own sakes literally, or for the sake of shadowing forth things not known but imagined. In either case they represent their originals, not indiscriminately as they are, but bettered, completed, or at the least simplified and enforced to our apprehensions, partly by the transmuting power of the artist's own instincts and partly by his discriminating, selecting, and rejecting power among the facts before him. But before we dismiss these arts, we must remember that imitation is not the whole of their task. Just as music and architecture, we saw, though non-imitative arts in the main, admitted occasional and partial elements of imitation, so sculpture, painting, and poetry include non-imitative elements in their turn. Part of the pleasures of sculpture, and a larger part of those of painting, are independent of the representation of natural facts, and depend only, like the pleasures of architecture, on abstract properties of line, color, and light-and-shade. In like manner part of the pleasures of poetry are independent of the images which the words in poetry call up, and depend only, like the pleasures of music, on the melody and emotional suggestiveness of the sounds of those words as they are combined in the line or stanza. It is impossible to distinguish how much of this pleasure which is received by the eye and ear respectively apart from imitation is purely organic pleasure of the senses, and how much is pleasure derived from the association of particular forms, hues, and sounds with desirable and beneficent qualities. Certain it is that there are figures and combinations of line, and patterns and arrangements of color, and successions, transitions, and oppositions of sound, which affect our senses with an organic pleasure; and certain it is no less that there are others which seem to affect them with a similar pleasure from being unconsciously associated in our minds with experiences of efficiency, beneficence, or power. The point at which these kindred pleasures merge into one another it does not here concern us to distinguish, if we could. It is sufficient that the effects of architecture and music depend, as we have learned, almost entirely on their appeal to these pleasures; while the effects of sculpture, painting, and poetry, depending mainly on the pleasures derived from idealized representation of fact, depend on the others also in a secondary but none the less in an indispensable degree. Thus, the outlines, intervals, and shadows of the masses in a work of sculpture are bound to be such as would please the eye, whether the statue or relief represented the figure of anything real in the world or not. The flow and balance of line, and the distribution of colors and light-and-shade, in a picture are bound to be such as would make an agreeable pattern although they bore no resemblance to natural fact (as, indeed, many subordinate applications of this art, in decorative painting and geometrical and other ornaments, do, we know, give pleasure though they represent nothing). The sound of a line or verse in poetry is bound to be such as would thrill the physical ear in hearing, or the mental ear in reading, with a delightful excitement even though the meaning went for nothing. If the imitative arts are to touch and elevate the emotions, if they are to afford permanent delight of the due pitch and volume, it is not a more essential law that their imitation should be of the order which we have defined as ideal, than that they should at the same time exhibit these independent effects which they share with the non-imitative group.

Having now sufficiently drawn attention to the effects presented by the several greater fine arts as divided into an imitative and a non-imitative group, and having found that division the most convenient for the general discussion of the nature of the several arts, if not the most important for practice, we may now pass to another point of view, and consider very briefly the results which are gained by a third mode of classification.

Third classification—the serviceable and non-serviceable arts.

3. *The Serviceable and the Non-Serviceable Arts.*—It has been established from the outset that, though the essential distinction of fine art is to minister not to necessity but to delight, yet among the arts of men there are some which do both these things at once, and add beauty, or the quality which gives us delight, to use, or the quality which satisfies our needs. This double character is inseparable, among the five greater arts, from architecture. We build in the first instance for the sake of necessary shelter and accommodation. By and by we find out that the aspect of our constructions is pleasurable or the reverse. Architecture is the art of building at once as we need and as we like, and a practical treatise on architecture must treat the beauty and the utility of buildings as bound up together. But for our present purpose it has been proper to take into account one half only of the vocation of architecture, the half by which it gives delight, and belongs to that which is the subject of our study, to fine art; and to neglect the other half of its vocation, by which it belongs to what is not the subject of our study, to useful or mechanical art. It is plain, however, that the presence or absence of this foreign element, the element of utility, constitutes a fair ground for a separate classification of the fine arts. If we took the five greater arts only, architecture would on this ground stand alone in one division, as the useful or serviceable fine art; with sculpture, painting, music, and poetry together in the other division, as fine arts unassociated with direct use or service. Not that the divisions would, even thus, be quite sharply and absolutely separated. Didactic poetry, we have already acknowledged, is a branch of the poetic art which aims at practice and utility. Again, the hortatory and patriotic kinds of lyric poetry, from the strains of Tyrtæus to those of Arndt or Rouget de Lisle, may fairly be said to belong to a phase of fine art which is directly concerned, if not with practical needs, at any rate with practical duties. So may the strains of music which accompany such poetry. The same practical character, as stimulating and attuning the mind to definite ends and actions, might indeed have been claimed for the greater part of the whole art of music, as that art was practised in antiquity, when each of several prescribed and highly elaborated moods, or modes, of melody were supposed to have a known effect upon the courage and moral temper of the hearer. In modern music, of which the elements, much more complex in themselves than those of ancient music, have the effect of stirring our fibres to moods of rapturous contemplation rather than of action, military strains in march time are the only purely instrumental variety of the art which may still be said to retain this character.

To reinforce, however, the serviceable or useful division of fine arts in our present classification, it is not among the greater arts that we must look. We must look among the lesser or auxiliary arts of the manual or shaping group. The potter, the joiner, the weaver, the smith, the goldsmith, the glass-maker, these and a hundred artificers who produce wares primarily for use, produce them in a form or with embellishments that have the secondary virtue of giving pleasure to the user. Much ingenuity has been spent to little purpose in attempting to group and classify these lesser shaping arts under one or other of the greater shaping arts, according to the nature of the means employed in each. Thus the potter's art has been classed under sculpture, because he moulds in solid form the shapes of his cups, plates, and ewers; the art of the joiner under that of the architect, because his tables, seats, and cupboards are fitted and framed together, like the houses they furnish, out of solid materials previously prepared and cut; and we ourselves had occasion above to class the weaver and embroiderer, from the point of view of the effects produced by their art, among painters. But the truth is, that each one of these auxiliary handicrafts has its own materials and technical procedure, which cannot, without forcing and confusion, be described by the name proper to the materials and technical procedure of any of the greater arts. The only satisfactory classification of these handicrafts is that now before us, according to which we think of them all together in the same group with architecture, not because any one or more of them may be technically allied to that art, but because, like it, they all yield products capable of being at the same time useful and beautiful. Architecture is the art which fits and frames together, of stone, brick, timber, or iron, the abiding and assembling places of man, all his houses, palaces, temples, workshops, roofed places of meeting and exchange, theatres for spectacle, fortresses of defence, bridges, aqueducts, and ships for seafaring. The wise architect having fashioned any one of these great constructions at once for service and beauty in the highest degree, the lesser or auxiliary manual arts come in to fill, furnish, and adorn it with things of service and beauty in a lower degree, each according to its own technical laws and capabilities; some, like pottery, delighting the user at once by beauty of form, delicacy of substance, and pleasantness of imitative or non-imitative ornament; some, like embroidery, by richness of tissue, and by the same twofold pleasantness of ornament; some, like goldsmith's work, by preciousness of fancy and workmanship proportionate to the preciousness of the material. To this vast group of workmen, whose work is at the same time useful and fine in its degree, the ancient Greek gave the place which is most just and convenient for thought, when he classed them all together under the name of *τέκτονες* or artificers, and called the builder by the name of *ἀρχιτέκτων*, arch-artificer or artificer-in-chief.

Of the manner in which the operation of these auxiliary manual arts has been modified in later times by the increase of mechanical agencies, and of the degree to which the intervention of such agencies, in multiplying one uniform design upon a vast number of wares, is compatible with the true characters of fine art in the product, we have said enough further back. It is time now to turn to the last section of our inquiry.

III. Of the History of the Fine Arts.

Hegel and the doctrine of the three periods.

Under this heading it will not be expected, nor will our space allow, that we should do more than touch in the most general terms on some of the great facts and divisions in the history of the several arts. The students of human culture have within the last hundred years concentrated a great deal of attentive thought upon the history of fine art, and have put forth various comprehensive generalizations intended at once to sum up, and to account for, the phases and vicissitudes of that history. The most famous formula of all is that of Hegel, to which we have already alluded. Hegel, we learned, regarded particular arts as being characteristic of and appropriate to particular forms of civilization and particular ages of history. For him, architecture was the symbolic art appropriate to ages of obscure and struggling ideas, and characteristic of the Egyptian and the Asiatic races of old and of the mediæval age in Europe. Sculpture was the classical art appropriate to ages of lucid and self-possessed ideas, and characteristic of the Greek and Roman period. Painting, music, and poetry were the romantic arts, appropriate to the ages of complicated and overmastering ideas, and characteristic of modern humanity in general. In the working out of these generalizations, Hegel has brought together a great mass of judicious and striking observations; and that they are generalizations containing on the whole a preponderance of truth may be admitted. It has been objected against them, from the philosophical point of view, that they too much mix up the definition of what the several arts theoretically are with considerations of what in various historical circumstances they have practically been. From the historical point of view, there can be taken what seems a more valid objection, that these formulas of Hegel tend too much to concentrate the attention of the student upon the one dominant art chosen as characteristic of any period, and to give him false ideas of the proportions and relations of the several arts at the same period,—of the proportions and relations which poetry, say, really bore to sculpture among the Greeks and Romans, or sculpture to architecture among the Christian nations of the Middle Age. The truth is, that the historic survey gained over any field of human activity from the height of generalizations so vast in their range and scope as these are, must needs, in the complexity of earthly affairs, be a survey too distant to give much guidance until its omissions are filled up by a great deal of nearer study; and such nearer study is apt to compel the student in the long run to qualify the theories with which he has started until they are in danger of disappearing altogether.

Herbert Spencer and the doctrine of Evolution.

Another systematic exponent of the universe, whose system is very different from that of Hegel, Mr. Herbert Spencer, has brought the great scientific generalization of our time, the doctrine of Evolution, to bear, not without interesting results, upon the history of the fine arts and their development. Mr. Herbert Spencer sets forth how the manual group of fine arts, architecture, sculpture, and painting, were in their first rudiments bound up together, and how each of them in the course of history has liberated itself from the rest by a gradual process of separation. These arts did not at first exist in the distinct and developed forms in which we have above described them. There were no statues in the round, and no painted panels or canvases hung upon the wall. Only the rudiments of sculpture and painting existed, and that only as ornaments applied to architecture, in the shape of tiers of tinted reliefs, representing, in a kind of picture-writing, the exploits of kings upon the walls of their temple-palaces. Gradually sculpture took greater salience and roundness, and tended to disengage itself from the wall, while painting found out how to represent solidity by means of its own, and dispensed with the raised surface upon which it was first applied. But the old mixture and union of the three arts, with an undeveloped art of painting and an undeveloped art of sculpture still engaged in or applied to the works of architecture, continued on the whole to prevail through the long cycles of Egyptian and Assyrian history. In the Egyptian palace-temple we find a monument at once political and religious, and into this one class of monument we find concentrated all the energies and faculties of all the artificers of the race. With its incised and pictured walls, its half-detached colossi, its open and its colonnaded chambers, the forms of the columns and their capitals recalling the stems and blossoms of the lotus and papyrus, with its architecture everywhere taking on the characters and covering itself with the adornments of immature sculpture and painting—this structure exhibits within its single fabric the origins of the whole subsequent group of shaping arts. From hence it is a long way to the innumerable artistic surroundings of later Greek and Roman life, the many temples with their detached and their engaged statues, the theatres, the porticos, the baths, the training-schools, with free and separate statues both of gods and men adorning every building and public place, the frescoes upon the walls, the panel-pictures hung in temples and public and private galleries. In the terms of the theory of evolution, the advance from the early Egyptian to the later Greek stage is an advance from the one to the manifold, from the simple to the complex, from the homogeneous to the heterogeneous, and affords a striking instance of that vast and ceaseless process of differentiation and integration which it is the law of all things to undergo. In the Christian monuments of the early Middle Age, again, the arts have gone back to the rudimentary stage, and are similarly attached to and combined with each other. The single monument, the one great birth of art, in that age, is the Gothic church. In this we find the art of applied sculpture exercised in fashions infinitely rich and various, but entirely in the service and for the adornment of the architecture; we find painting exercised in fashions more rudimentary still, principally in the forms of colored imagery in the chancel windows and illuminated miniatures in the pages of missals and service-books. And from this stage again the process of the differentiation of the arts is repeated. It is by a new evolution or unfolding, and by one carried to much farther and more complicated stages than the last had reached, that the arts since the Middle Age have come to the point where we find them to-day; when architecture is applied to a hundred secular uses with not less magnificence, or at least not less desire of magnificence, than that with which it fulfilled its single sacred use of old; with sculpture adorning, or intended to adorn, all our streets and commemorating all our likenesses; with the subjects of painting extended from religion to all life and nature, until this one art has been divided into the dozen branches of history, landscape, still life, genre, anecdote, and the rest. Such being in brief the successive stages, and such the reiterated processes, of evolution among the shaping arts, the action of the same law can be traced in the growth of the speaking or time arts also. Originally poetry and music, the two great speaking arts, were not separated from each other and from the art of bodily motion, dancing. The father of song, music, and dancing, all three, was that savage of whom we have already spoken, who first clapped hands and leapt and shouted in time at some festival of his tribe. From the clapping, or rudimentary rhythmical noise, has been evolved the whole art of instrumental music, down to the entrancing complexities of the modern symphony. From the shout, or rudimentary emotional utterance, has proceeded by a kindred evolution the whole art of vocal music down to the modern opera or oratorio. From the savage leap, or rudimentary expression of emotion by rhythmical movements of the body, has descended every variety of dancing, from the stately figures of the tragic chorus of the Greeks to the *kordax* of their comedy or the *cancan* of modern Paris.

That the theory of evolution serves well to group and to interpret many facts in the history of art we are not disposed to deny, though it would be easy to show that Mr. Herbert Spencer's instances and applications are not sufficient to sustain all the conclusions that he seems to draw from them. Thus, it is perfectly true that the Egyptian or Assyrian palace wall is an instance of rudimentary painting and rudimentary sculpture in subservience to architecture. But it is not less true that races who had no architecture at all, but lived in caverns of the earth, exhibit, as we have already had occasion to notice, the rudiments of the other two arts, in a different form, in the carved or incised handles of their weapons. And it is almost certain that, among the nations of Oriental antiquity themselves, the art of decorating solid walls so as to please the eye with patterns and representations of natural objects was itself borrowed from the precedent of an older art, which works in easier materials, the art of weaving or tapestry. It would be in the perished textile fabrics of the earliest dwellers in the valley of the Nile and the Euphrates that we should find, if anywhere, the origins of the systems of surface design, whether conventional or imitative, which those races afterwards applied to the decoration of their solid constructions. Not in any one exclusive type of primitive artistic activity, but in a score of such types equally, varying according to race, region, and circumstances, shall we find so many germs or nuclei from which whole families of fine arts have in the course of the world's history differentiated and unfolded themselves. And once at least during that history, a cataclysm of all the political and social forces has not only checked the process of the evolution of the fine arts, but from an advanced stage of development has thrown them back again—we speak especially of the manual group—to the primitive stage where they are all practised conjointly and in mutual interdependence. By Mr. Herbert Spencer's application of the theory of evolution, not less than by Hegel's theory of the historic periods, attention is called to the fact that Christian Europe, during several centuries of the Middle Age, presents to our study a civilization analogous to the civilization of the old Oriental empires in this respect, that its ruling and characteristic manual art is architecture, to which sculpture and painting are, as in the Oriental empires, once more subjugated and attached. It does not of course follow that such periods of fusion or mutual dependence among the arts are periods of bad art. On the contrary, each stage of the evolution of any art has its own characteristic excellence. There is an excellence of sculpture as a decorative or subsidiary art, and that it reached in the Gothic age. There is an excellence of sculpture as an independent art, and that it reached in Greece in the 5th century B. C., and again approached in Tuscany in the 15th century A.D. The arts can be employed in combination, and yet be all severally excellent. When music, dancing, acting, and singing were combined in the performance of the Greek chorus, the combination no doubt presented a relative perfection, of each of the four elements analogous to the combined perfection, in the contemporary Doric temple, of pure architectural form, sculptured enrichment of spaces specially contrived for sculpture in the pediments and frieze, and colored decoration over all. The extreme differentiation of any art from every other art, and of the several branches of one art among themselves, does not by any means tend to the perfection of that art. The process of evolution among the fine arts may go, and, indeed, in the course of history has gone, too far. Thus an artist of our own day is usually either a painter only or a sculptor only; but yet it is acknowledged that the painter who can model a statue, or the sculptor who can paint a picture, is likely to be the more efficient master of both arts; and in the best days of Florentine art the greatest men were generally painters, sculptors, architects, and goldsmiths all at once. In like manner a landscape painter who paints landscape only is apt not to paint it so well as one who paints the figure too; and in recent times the skill of engraving had almost perished from the habit of allotting one part of the work, as skies, to one hand, another part, as figures, to a second, and another part, as landscape, to a third. This kind of continually progressing subdivision of labor, which seems to be the necessary law of industrial processes, is fatal to any skill which demands, as skill in the fine arts, we have seen, demands, the free exercise and direction at every moment of a highly complex cluster both of faculties and sensibilities. Turning to the other group of arts, there are reformers who say that the process of evolution and differentiation has in like manner gone too far with music. Music, as separated from words and actions, say Dr. Wagner and his followers,—independent orchestral and instrumental music,—has reached its utmost development, and its farther advance can only be an advance into the inane; while the music that is still associated with words, operatic music, has broken itself up into a number of set and separate forms, as aria, scena, recitative, which correspond to no real varieties of instinctive emotional utterance, and in the aimless production of which the art is in danger of paralyzing and stultifying itself. This process, they say, must be checked; music and words must be brought back again into close connection and mutual dependence; the artificial opera forms must be abolished, and a new and homogeneous musical drama must be created, of which the author shall combine in himself the now differentiated functions of poet, composer, inventor, and director of scenery and stage appliances, so that the entire creation may bear the impress of a single mind.

M. Taine and the doctrine of physical and social causes.

It is thus evident that the evolution theory furnishes us with some instructive points of view for the history of the fine arts as for other things. Another key to what is called the philosophy of that history, although one which has been employed with results perhaps less really luminous than they are certainly showy and attractive, is that supplied by a distinguished French writer, M. Taine. M. Taine's philosophy, which might perhaps be better called a natural history, of fine art, consists in regarding the fine arts as the necessary result of the general conditions under which they are at any time produced—conditions of race, conditions of climate, conditions of religion, civilization, and manners. Acquaint yourself with these conditions as they existed in any given people at any given period, and you will be able to account for the characters assumed by the arts of that people at that period and to reason from one to the other, as a botanist can account for the flora of any given locality and can reason from its soil, exposure, and temperature, to the orders of vegetation which it will produce. This method of treating the history of the fine arts, again, is one which can be pursued with profit, in so far as it makes the student realize the connection of fine art with human culture in general, and teaches him how the arts of any age and country are not an independent or arbitrary phenomenon, but are essentially an outcome, or efflorescence, to use a phrase of Professor Ruskin's, of many deep-seated elements in the civilization which produces them. But it is a method which, rashly used, is very apt to lead to a hasty and one-sided handling both of history and of art. It is easy to fasten on certain obvious relations of fine art to general civilization when you know a few of the facts of both, and to say, the cloudy skies and mongrel industrial population of Amsterdam at such and such a date had their inevitable reflection in the art of Rembrandt; the wealth and pomp of the full-fleshed burghers and burgesses of Antwerp had theirs in the art of Rubens. But to do this in the precise and conclusive manner of M. Taine's treatises on the philosophy of art always means to ignore a large range of conditions or causes for which no corresponding effect is on the surface apparent, and generally, also, a large number of effects for which appropriate causes cannot easily be discovered either. The truth is, that this particular efflorescence of human culture depends for its character at any given time upon combinations of causes which are by no means simple, but generally highly complex, obscure, and nicely balanced. For instance, the student who should try to reason back from the holy and beatified character which prevails in much of the devotional painting of the Italian schools down to the Renaissance would make a great mistake if he were to conclude, "like art, like life, thoughts, and manners." He would not understand the relation of the art to the general civilization of those days unless he were to remember that one of the chief functions of the imagination is to make up for the shortcomings of reality, and to supply to contemplation images of that which is most lacking in actual life; so that the visions at once peaceful and ardent of the religious schools of the Italian cities are to be explained, not by the peace, but rather in great part by the dispeace, of contemporary existence.

Speaking and shaping groups have no common history.

Either of the three modes of generalization to which we have referred might no doubt yield, however, supposing in the student the due gifts of patience and of caution, a working clue to guide him through that immense region of research, the history of the fine arts. But it is hardly possible to pursue to any purpose the history of the two great groups, the shaping group and the speaking group, together. Words are a means of expression which men have generally mastered more quickly than any other; and in Greece all three divisions of the art of poetry, the narrative, lyric, and dramatic, had been perfected, and two of them had again declined, before sculpture reached maturity, or painting had passed beyond the stage of its early severity. Again, many nations have been great in poetry at a time when their other fine arts flourished humbly if at all—as England in the days of Elizabeth. The history of poetry must thus of necessity be a separate study. And so must the history of music. Music in its independent development is an invention,—whether made, as some think, in response to the special needs of modern souls, or, as others hold, simply like other inventions in the progress of human ingenuity—but at any rate an invention of the last two hundred years.

Main periods in the history of shaping group.

On the other hand, it is very possible to take the whole of the shaping group of fine arts together, and to pursue connectedly the history, throughout the course of civilization, of architecture, sculpture, and painting, and of their mutual relations with one another. Being all arts of manual dexterity, and all occupied in providing for our delight objects intended for visual contemplation in space, these have a natural and practical affinity. Leaving aside the arts of the races of Egypt and the East, which, profoundly interesting as they are, have had no direct effect upon ourselves except in so far as they communicated the first hints or germs of inspiration to the ancestors and masters of Western civilization, the Greeks,—leaving those aside, the history of the manual arts of architecture, painting, and sculpture, falls naturally into four great periods or divisions:—(1) the Greek and Roman period, from about 700 B.C. to the final triumph of Christianity, say 400 A.D.; (2) the Christian period, from the triumph of Christianity to about 1260 A.D. in Italy and about 1460 in northern Europe; (3) the Renaissance period, from the above dates till about 1620 A.D.; (4) the modern period, from about 1620 to our own day. We have not set down, as is usually done, a specifically Gothic age in art, for this reason. The characteristic of the whole Christian period is that its dominant art is architecture, chiefly employed in the service of the church, and with the arts of painting and carving only applied subordinately for its enrichment. It makes no essential difference to this fundamental character that from the 5th to the 12th century the forms of this art were derived in the east of Europe from the Byzantine branch, and in the west from the branch usually called Romanesque, of the round-arched architecture of the empire; and that by the 13th century a new form of architecture, in which the round arch was replaced by the pointed, and the decorations took another character, had been invented in France, and from thence spread abroad to Germany, England, Spain, and last to Italy. The essential difference only begins when the imitative arts, sculpture and painting, begin to develop and detach themselves, to exist and strive after perfection on their own account. This happens in Italy with the artificers of the 13th and 14th centuries, with Niccola Pisano and Giotto; and it happens, though the respective arts are still wholly engaged upon ecclesiastical subjects, in connection with an incipient study of and passion for antique models. From this time and onward, that movement of men's minds which gradually enthroned the images of pagan antiquity beside those of Christian worship as the ideal theme of art, continued until, in the 15th century, it communicated itself to the more pious races of the North, and until in Italy it reached its culmination in the genius of Michelangelo and of Raphael. The same movement of the arts held on, with its energy exhausted and its inspiration flagging, until, soon after the beginning of the 17th century, the Dutch school of common life appeared and announced the greatest revolution of all. This is a revolution which has its counterpart in literature too, and which proceeds from a modern manner of regarding life totally different from that of either antiquity, the Christian Middle Age, or the Renaissance. By it the fine arts were brought down from the exclusive regions of the religious and the classical ideal, and launched upon their human, their secular, their democratic, their realistic career, of which who shall as yet foretell the issue? (S. C.)

FINGAL, the name of the chief hero in the English prose epics called the *Poems of Ossian*, written in the last century by James Macpherson, and based to a certain extent upon poems and prose tales to be found in manuscripts written in Irish—the literary language common to both Ireland and Gaelic Scotland—or still preserved in memory by the Celtic-speaking people of both countries. The *Finn ua Baiscni*, or *Find MacCumhaill*, of those poems and tales was, according to all Irish and Scottish traditions, the *Rig*, or king—for that word was one of wider application than in modern times—of the Leinster *Fians* or Fenians (see FENIANS) in the time of the monarch *Cormac* son of *Art;* and he resided at a *Dun*, or fort, at *Almhain*, now the Hill of Allen, in the county of Kildare, whence has come the name of Bog of Allen given to the great central bogs of Ireland. *Grainné*, daughter of *Cormac Mac Airt*, was betrothed to *Find;* but she having eloped with a celebrated warrior of the *Fians*—*Diarmait ua Duibhne*—her father offered him another daughter, *Ailbhé*, distinguished for her wisdom. The elopement of *Diarmait* and *Grainné* and their pursuit by *Find* is the subject of one of the most important of the Irish Fenian tales. *Find's* courtship of *Ailbhé* is also the subject of a curious tale. *Find* is said to have been killed in the year 283 A. D., at a place called *Ath Brea*, on the river Boyne, by a fisherman who thought to distinguish himself thereby. *Find's* sons—*Fergus Finnbheoil*, or the Eloquent, and *Oisín* (the Little Deer)—were poets, and some poems attributed to them still exist. *Oscar*, the celebrated son of *Oisín*, was killed at the battle of Gabhra, which broke the Fenian organization and power; but *Oisín* and a few others survived that battle, and according to popular tradition, lived down to the time of St. Patrick. The Fenian period, though not strictly within the historic period, is so close upon its threshold, that *Find* may have been a real personage. Much that is told of himself and of his father, *Cumall* son of *Trenmore*, might have happened. None of the poems attributed to *Find* himself, or his sons *Oisín* and *Fergus*, though some are in a manuscript of the 12th century, belong, at least in their present form, to the supposed time of the poets. But even if we admit that *Find* and the other Fenians were real personages, they have become, like *Art* and his son *Cormac*, the centres of a luxuriant growth of legend, *Find* himself having grown into a powerful giant.

In taking *Find* as the hero of his new epic, Macpherson changed his name, apparently for euphony sake, to Fingal, and made him king of a fictitious petty kingdom of Morven, corresponding apparently with the deanery of that name in the mediæval diocese of Argyle. The name Fingal is not, however, of his own coinage. A large number of Irish personal names end in the same letters, *e.g.*, *an* (Abban, Aedan, etc.), *nall* (Domhnall, Seachnall, etc.) *gen, gan* (Cellgen, Corrgen, etc.), *gus* (Fergus, Oingus, Snedgus, etc.), *gal* or *ghal* (Fergal, Aedhghal, etc.). The same stem, by the addition of different suffixes, gives a series of names, *e. g.*, *Ferbaeth*, *Fergal*, *Fergus*, etc. The stems are often the names of colors, *e.g.*, *Donngal*, *Dubhgal*, *Gormgal*, *Fingal*, brown, black, blue, fair. According to the *Annals of the Four Masters*, there was an abbot of Lismore in Ireland named Fingal, who died in 741 A. D. The suffix *gal* has been assumed to mean stranger or foreigner, so that Fingal would be the fair stranger. This is, however, a mere guess. The meaning of the stems is equally uncertain; fair, brown, black, are designations which might be applied with propriety to the person, but what shall we say of blue, unless the person first called *Gormgal* painted himself blue with woad after the manner of the ancient Britons. There is even a better justification than mere euphony for the change of *Finn* or *Find* into Fingal. Barbour, in his *Bruce*, written in 1375, has the following interesting passage (*The Brus*, xix. p. 49, Spalding Club edition) proving the ancient use of the form Fingal:—

> "He said, 'Methink, Marthokis sone,
> Richt as Golmakmorn was wone
> To haf fra Fingal his menyhe,
> Richt sa all his fra us has he.'"

In transferring his hero Fingal to Morven, Macpherson was also justified, for that district has an old Fenian topography of its own. Kirke in his *Psalter*, published in 1684, actually calls the districts from Morvaren to Glenelg and the Isles the land of the *Fian* or Fenians. These and the neighboring districts are also intimately associated with the legends of the heroic period of *Cuchulaind*.

FINI. See MASOLINO.

FINIGUERRA, MASO (contraction for TOMMASO), a Florentine goldsmith, is distinguished as the inventor of the method of taking impressions from engraved plates. The date of his birth is not ascertained, and conjectures vary from 1400 to 1426. He was one of the best workers in niello, a form of decorative art then very much in vogue in Italy, which, however, in the next century fell into neglect. He is said to have been a pupil of the famous sculptor Lorenzo Ghiberti, and to have assisted him in the execution of the beautiful bronze gates of the baptistery of Florence; but whether the first or second pair of gates is not stated. Baldinucci makes him a pupil of Masaccio; but it appears probable that he was rather one of those art students who were powerfully influenced by the new style, noble in simplicity, of Masaccio's works, than a personal disciple of the painter. One indisputably genuine work of Finiguerra is still extant, a silver Pax on which is wrought in niello a representation of the Coronation of the Virgin. By some writers it is called an Assumption. It was executed for the church of San Giovanni Battista at Florence, and is still preserved there. It is in height a little more than 4 inches, and in breadth about 3 inches; and within this small space is a composition of more than forty figures, marvellous for accuracy of drawing and minute finish. The date of its completion is fixed by an entry in the city archives, under the year 1452. During the progress of the work the artist, according to the custom, took casts in sulphur from the plate, and also impressions upon damped paper. For these impressions he made use of a smooth roller, which passed over the paper on the plate, and produced impressions that looked like pen drawings. This method was followed by other workers; and thus copper-plate engraving and printing soon became generally practised in Italy. The title of Finiguerra to the discovery was long disputed, especially on the ground that while prints by early German masters were in existence bearing earlier dates than any Italian engravings, not a single print by Finiguerra could be produced in support of his claim. The question was settled by Zani's discovery in 1797, in the National Cabinet of Paris, of the identical impression taken by the artist himself from the silver Pax of San Giovanni. This print is believed to have been executed as early as 1440. Zani's account of his discovery (see Ottley's *History of Engraving*, vol. i. pp. 306–312) is a singularly fascinating narrative, breathing an enthusiasm as intense and a joy as devout as those of a Columbus who first sights a long-sought world. The date of Maso's death is not known. Zani places it about 1460, others about 1475.

FINISTÈRE, or FINISTERRE, the most western department of France, forming part of the old province of Bretagne or Brittany, is bounded on the N.W. and S. by the ocean, and on the E. by the departments of Côtes-du-Nord and Morbihan. It extends from 47° 44′ to 48° 47′ N. lat., and from 3° 22′ to 4° 50′ W. long., being 78 miles in length from north to south by 63 in width, and having an area of 666,705 hectares, or 2574 square miles. Two chains of hills run nearly parallel from east to west through this department, and divide it into three zones of almost equal extent, conveying the waters in three different directions. North of the Arrez, or more northern of the two chains, the waters of the Douron, Jarleuc, Penzé, and Flèche flow northward to the sea. South of the Noires range, the Odet, Aven, Ioste, and Elle flow southward; while the region inclosed by the two chains having a declination westward, the waters of the Aulne and the Elorn flow into the Brest roads. The rivers are all small, and none of the hills attain a height of 900 feet. The coasts are generally steep and rocky, and indented with numerous bays and inlets, affording some excellent harbors, the principal being those of Brest, La Forest, Morlaix, Landernau, Quimper, and Douarnenez. The only navigable rivers are the Aulne, Elorn, and Odet. Off the coast lie a number of islands and rocky islets, the principal of which are Ushant and Bas. The climate is temperate, but rather humid; the prevailing winds are the W., S.W., and N.W. More than a third of the soil is under cultivation, and about an equal proportion is heath or waste land, rather the larger proportion of the remainder being pasturage, and the rest woods and forests. Though so small a portion of the land is under cultivation, the produce of corn is more than sufficient for the population, and might be greatly increased if the primitive agricultural implements and methods still in use were superseded by the introduction of modern improvements. The chief crops are oats, rye, wheat, and barley; flax, hemp, and pulse are also produced. The farm and dairy produce, though plentiful in quantity, is indifferent in quality; but great attention is paid to the breeding and feeding of cattle. In the department there are a large number of orchards and gardens, and vegetables are largely grown for exportation. The fisheries of the coast, particularly the pilchard fishery, employ a great many hands, and render this department an excellent nursery of seamen for the French navy. Finistère is rich in minerals: iron, coal, lead, bismuth, and zinc mines are worked; and there are quarries of granite, slate, marble, and porphyry. The lead mines of Poullaouen and Huelgoat, which yielded a considerable quantity of silver, have not been worked since 1869. The manufactures are linens, woollens, sailcloth, ropes, paper, leather, earthenware, soda, soap, candles, sugar, etc. Shipbuilding is carried on at Brest and other seaports. Finistère is divided into the arrondissements of Quimperlé, Brest, Châteaulin, Morlaix, and Quimper, the town of Quimper being the capital of the department. The population of Finistère in 1872 was 642,963, and 1876 it was 666,106.

FINLAND (Finnish *Suomi*, or *Suomenmaa*, the Swampy Region, of which Finland—Fen Land—is said to be a Swedish translation), a grand-duchy forming an administrative division or government of Russia, lies between 59° 48′ and 70° 6′ N. lat., and 20° 29′ and 32° 47′ E. long. It is bounded on the N. by Norway, on the E. by the governments of Archangel and Olonetz, on the S. by the Gulf of Finland, and on the W. by the Gulf of Bothnia. Its greatest length is 717 miles, greatest breadth 378 miles, the average breadth being about 185 miles; the area is 144,221 square miles. The surface is a labyrinthine mixture of land and water; and the sea-coast, especially in the south and south-west, presents the same succession of fiords and rocky headlands that characterizes the coasts of Norway and Sweden. The fiords of Finland, however, seldom exceed a few miles in extent. The coast is studded with innumerable small islands and rocks called skår; some of these islands, as those of Sveaborg, have been converted into fortresses of great strength. The intricate archipelago of islets and granite and limestone rocks in the Bothnian gulf renders the navigation extremely dangerous. The lakes occupy about 12 per cent. of the area, the marshes 20 per cent., so that Finland is more abundantly supplied with water than any other country in the world. The land appears to have been formerly a sea-bed, which was gradually elevated and is still rising at the rate of about 3·4 feet on the Gulf of Bothnia, and 1·9 feet on the Gulf of Finland in a hundred years. The surface consists of primitive rocks, as gneiss, porphyritic and syenetic granite, diorite, gabbro, and hyperesthene, and of formations allied to the older metamorphic and the Cambrian. Neither fossils nor coal have been found. Geologists suppose that the land, a low table-land, continuous along its north-western and southern borders with two low and flat border-ridges, was long ago covered with an immense ice-sheet, which, creeping from Scandinavia, crossed the Gulf of Bothnia, traversed southern Finland in a direction south by east, crossed the Gulf of Finland, and crept further on in the Baltic provinces. The numberless striæ, the positions and directions of which exclude any suspicion of their having been traced by floating ice, the striation on the islands of the shallow gulfs, together with that of the Onega basin, the Neva valley, and the Baltic provinces, the uninterrupted sheet of till, *i.e.*, of a true unstratified and unwashed morainic deposit covering Finland, the numberless moraines parallel to the glacial striæ, and hundreds of other evidences seem to settle the existence of such an ice-sheet beyond doubt. As to traces of marine formations, there are none above a level of about 100 or 120 feet; only lacustrine deposits cover the till above this level.

The greater portion of the interior is, as has been said, a vast table-land, averaging in height from 350 to 400 feet, and interspersed with hills of no great elevation. Heights of considerable elevation are found only in the most northerly part, where the highest summit, Haldefjåll (Lappish Haldischok), rises to 4124 feet in the north-west on the Norwegian border. Other single mountains reach from 2000 to 3000 feet, and the higher ridges 1000 feet. The land falls towards the south. The principal central ridge Maanselkå (*i.e.*, land-ridge), about 1300 feet high, the watershed between the Arctic Ocean and the Gulf of Bothnia, forms the boundary between Russia and Finland from 68° to 64° N. lat., running thence under the name of Suomen-selka (*i.e.*, Finland-ridge) towards the south-west as far as the Gulf of Bothnia, 62° N. lat. Several spurs run off from this ridge towards the south, forming watersheds, but rising little above the general level of the table-land. The largest plain lies on the narrow middle part of the Gulf of Bothnia.

By the above-mentioned ridges Finland is divided into five great basins. In the south-eastern basin, besides Lake Ladoga on the border, lies Lake Saima, along with 120 larger and several thousand smaller lakes, discharging by the river Wuoksen into Lake Ladoga; in the middle or southern basin is Lake Påijåne, discharging by the river Kymmene into the Gulf of Finland; in the south-west basin the waters unite near the town of Tammerfors in the little lake Pyhåjårvi, and discharge by the river Kumo into the Bothnian Gulf; in the north-west is the Uleå basin, with an outflow by the rivers Uleå, Kemi, and Torneå into the same gulf; the north basin contains Lake Enare (nearly 1000 square miles), covered with ice for ten months in the year, and sending its waters into the Arctic Ocean. The rivers are full of rapids, and rarely navigable, but serve for floating down large quantities of timber from the extensive woods of the interior, and also furnish motive power for many mills. The lakes are united by canals.

The climate of Finland is severe, but generally healthy. The mean yearly temperature in the north is 27·5° Fahr.; at Helsingfors, 38·7°. The average annual rainfall is 20 inches.

Immense forests cover one-half of the area of the country, reaching on the north as far as Lake Enare. They consist chiefly of pine, spruce, fir, and birch, the oak growing wild only in the south, where also are found apples, pears, and cherries. Rye is cultivated as far as the Arctic Circle, barley mostly in the north to Lake Enare, oats as far as 65° N. lat., wheat but little and only in the south, buckwheat and flax to 64° N. lat., hemp to 66°, and potatoes everywhere. The flora includes 1080 phanerogams and 1800 cryptogams. Of wild animals the bear, wolf, fox, ermine, hare and squirrel are the most common, with the lynx, elk, rein-deer; and seals in the sea and in Lakes Ladoga and Saima. Among birds, are the woodcock, moorcock, blackcock, white ptarmigan, partridge, swan, goose, duck. The fish include the salmon, perch, pike, and other common kinds.

The population in 1875 was 1,912,647, divided among the various provinces as follows:—

	Sq. miles.	Population.
Åbo	9,332	318,610
Kuopio	16,499	238,280
Nyland	4,584	183,845
St. Michel	8,818	162,836
Tavastehus	8,333	202,250
Uleåborg	63,954	193,584
Wasa	16,623	324,232
Wiborg	16,078	289,010
	144,221	1,912,647

The yearly increase of the population is at the rate of 1·05 per cent.; the density is one person to 148·6 acres. The population of the 35 towns was, in 1875, 148,355, or 7·7 per cent. of the whole. Of the population 98 per cent. belong to the Lutheran Church, somewhat less than 2 per cent. to the Greco-Russian Church, while Roman Catholics and Jews together number only about 1230; in 1870 there were 86 Mahometans. Of the whole population, 85 per cent. are Finns proper, 14 per cent. are Swedish-speaking farmers and peasants, chiefly in the governments of Nyland, Åbo, and Wasa, on the coasts and islands; Russians number about 6000, besides the military, mostly in the towns; Germans 1200, in Helsingfors and Wiborg; gypsies about 1000; and, to the furthest north, Lapps 600. Agriculture occupies about 80 per cent. of the population; trade, shipping, and manufactures, 7 per cent.; the professions, 1·5 per cent.; military, 1 per cent. The proportion of men to women is 1000 to 1056. The average number of illegitimate births is 7 per cent. The mean duration of life is 37 years, being 35·6 among men and 38·4 among women. The epidemic diseases are typhus, nervous fever, and, in dry summers, diarrhœa. Of the deaths 3 per cent., or 1179 (1874), were violent. Nearly 7000 are whole or half blind. There is some emigration to Russia and the north of Norway, and thence to the United States, chiefly to Michigan.

The chief occupation is agriculture, for which the soil in the south-west and on the coast of Wasa is best adapted. Modern methods of agriculture are found only in the south, the hoe being the principal implement in the east. The area under cultivation is about 2,000,000 acres,—of which 700,000 are occupied with rye, 300,000 with barley, 240,000 with oats, and 600,000 are fallow. Sometimes, especially in the north, the night frosts destroy the crops, and then meal has to be largely imported from Russia. There are ten agricultural schools, two of which are of a higher class. Of the land 35 million acres belong to the crown, 6 millions to the upper classes, and 50 millions to the peasantry. Serfdom never existed in the country.

Of the exports about one-half is timber, though the forests are much thinned by fires, uprooting, and extravagance. Of the land under wood (64 per cent.) 39 per cent. belongs to the crown, under the superintendence of forest-masters, there being one school of forestry. In 1876 there were upwards of 200 saw-mills, the export amounting to 41,536,169 cubic feet—planks, boards, battens, etc., besides 7,432,617 cubic feet of round timber.

Cattle-breeding is successful on account of the many natural meadows, the good pasturage, and abundance of water. Government gives premiums for riding and draught horses, and for improvement in the breeds of horses and cattle. The value of butter and other dairy produce exported in 1875 amounted to nearly £800,000; of horses 250,000, horned cattle 100,000, sheep 900,000, swine 190,000, and rein-deer 60,000 were exported.

The herring fishery is of some importance, while the rivers yield considerable quantities of salmon, and the lakes white-fish (*Coregonus albus*). The export of fish in 1876 was valued at over £100,000.

Granite, marble, felspar, and quartz are quarried to the north of Lake Ladoga, and porphyry on the island of Hogland. There is also an extensive granite quarry at Pytterlahti near Fredrikshamn. Iron-mining and smelting are important industries. In 1876, 68,000 tons of iron ore were raised; 21 iron-works turned out 26,000 tons of cast-iron. Besides this, 13 refining works turned out 16,000 tons of bar-iron. The iron exports in 1874 amounted to 19,230 tons, and the imports were 47,270 tons, half of which consisted of ore; while in 1876 the iron export amounted to only 12,000, and the import to 31,000 tons. Copper and tin are found, and in Lapland a little gold. Lime is obtained nearly everywhere.

Finland has about 420 manufactories of various kinds, giving employment to about 11,000 workpeople. The principal articles manufactured are metal goods, cotton goods, woollen cloth, paper, candles, soap, tobacco, sugar, brandy, beer, leather. The whole production is valued at £1,480,000.

The value of the whole exports in 1876 amounted to £3,948,200, timber representing about one-half, cattle one-seventh, grain about 1 per cent., iron and steel goods about 7 per cent., woven goods 7 per cent., paper 2½ per cent., fish and game nearly 3 per cent., tar 3½ per cent., butter, etc., 21 per cent. The imports were valued at £5,541,710; of this 15 per cent. represented woven goods, grain 17½ per cent., iron and steel 8½ per cent., coffee 7 per cent., sugar 6 per cent., cotton 4½ per cent., tobacco 2½ per cent., salt 2 per cent., wine and spirits 3½ per cent. In 1876 the exports showed an increase in timber, tar, butter, grain, and hides, and a falling off in woollen goods and iron. In the import list a falling off took place in all articles except cotton, petroleum, and coffee. In 1876 the custom-house receipts were £424,603, showing a falling off of about one-tenth as compared with 1875. In the imports Russia holds the first place, Germany being second, Great Britain third, and Norway and Sweden fourth. Russia also comes first in the export list, Great Britain second, and Germany and Norway and Sweden respectively third and fourth. The shipping that entered the various ports numbered 9364 vessels of all kinds, of 1,314,999 registered tons; 9220 vessels of 1,310,679 tons cleared the ports. The Finnish merchant shipping in 1875 numbered 1900 vessels of more than 18½ tons (280,000 tons in all; 125 of these (7103 tons) were steamers. A considerable amount of shipbuilding is carried on on the west coast.

The total length of the state railways is 524 miles, which, with a private railway of 21 miles, connect the capital Helsingfors with Åbo, Hangö, Tammerfors, Tavastehus, Borgå, Wiborg, and St. Petersburg. The longest canal is that known as the Saima canal, 37 miles long, connecting Lake Saima with the Gulf of Finland; besides this there are several smaller canals rendering navigation practicable between several of the lakes. The telegraph, under Russian management, connects nearly all the towns of the country.

The education of Finland is carried on in one university (Helsingfors), 14 lyceums and *realschulen*, one polytechnic, two industrial, six navigation, one cadet, two superior and eight inferior agricultural, two trade schools, besides two schools for the blind, and four for deaf and dumb. These include both state and private schools. For popular instruction there are three normal seminaries and 448 primary schools, most of them Finnish, 67 being Swedish, 5 mixed Finnish and Swedish, and 2 Russian. Besides these there seem to be a number of peripatetic teachers who teach many that do not attend school. In 1875, 24 publishers issued 154 books, which had a sale of a million and a quarter copies. There are 55 journals of various kinds, one-half being Finnish.

The czar of Russia is grand-duke of Finland, the external affairs of both countries being the same. So far as internal administration is concerned, Finland is an independent state. The constitution dates from 1772–1789, and is based besides upon the pledge of the czar Alexander I. in 1809 (when Swedish Finland was annexed), renewed by his successors, and upon the decree of the diet of date 1869. The czar decides as to war and peace, and as to treaties, has the right of pardon, appoints the officials of the country, who, however, must be natives, and is the last appeal in law. The government of the country and the administration of justice are carried on by the Imperial Senate for Finland, consisting of eighteen members appointed by the czar, under the presidency of the governor-general of Finland. The particular affairs on which the czar has to decree are laid before him by the state secretary for Finland. The legislative function is exercised by the czar and diet or landtag (*Seim*), without the consent of which no law can be either ordained or repealed, no new taxes imposed, or soldiers levied. The diet is called together every five years, and consists of the representatives of the nobility, clergy, citizens, and peasantry. The nobility are represented by the heads of the noble families admitted into the House of Nobles; the other deputies are elected, the bishops being admitted on account of their office. The official language is Swedish. For administrative purposes Finland is divided into eight låns or governments, the names of which are given above. An older division was the districts of Finland proper, Åland, Sata-Kunta, Nyland, Tavastland, Karelen, Savolaks, Osterbotten, and Lapland. The låns are divided into *harads* or districts, and these into parishes or communes, of which there are 480, and which have the management of their own internal affairs. The administration of the law lies in the first place with the senate, in the second place with the high courts established in Åbo, Nikolaistad, Wasa, and Wiborg, and finally with the district courts in the country and the municipal courts in the towns. The established religion is that of the evangelical Lutheran Church, under the archbishop of Åbo and the bishops of Borgå and Kuopio. There is an ecclesiastical assembly or convocation every ten years, with thirty-four clerical and fifty lay representatives. There is complete religious freedom for other bodies. The Greco-Russian parishes are under the metropolitan in St. Petersburg.

The public income of the country in 1877 was £1,267,732, and the expenditure £1,267,738, while on January 1, 1878, the debt was £2,462,470. Besides the national bank of Finland, there are two private banks, thirty-nine savings' banks, and three fire insurance establishments. The military force of Finland consists of one battalion of riflemen. The Finnish coinage consists of a *markka* or silver mark of 100 *penni*, equal to about 9½d. In 1878 a new gold coinage was issued, consisting of two pieces of 20 and 10 francs or markka respectively. The Finnish mile is equal to 10 versts or 6·64 English miles. The fathom of 3 ells of 2 Finnish feet is equal to 1·9483 English yards. The *tunland* contains 1·21983 acres. The "ship-pound" contains 374·85 ℔ avoirdupois, the Finnish ℔ being equal to 0·93713 ℔ avoirdupois; the ton is equal to 4·5395 bushels, the last to 1·86 ton register, the "can" to ·57645 imperial gallon.

History.—It was probably at end of the 7th or beginning of the 8th century that the Finns took possession of what is now Finland, though it was only when Christianity was introduced, about 1157, that they were brought into contact with civilized Europe. They probably found the Lapps in possession of the country. The early Finlanders do not seem to have had any governmental organization, but to have lived in separate communities and villages independent of each other. Their mythology consisted in the deification of the forces of nature, as "Ukko," the god of the air, "Tapio," god of the forests, "Ahti," the god of water, etc. These early Finlanders seem to have been both brave and troublesome to their neighbors, and their repeated attacks on the coast of Sweden drew the attention of the kings of that country. King Eric IX. (St. Eric), accompanied by the bishop of Upsala, Henry (an Englishman, it is said), and at the head of a considerable army, invaded the country in 1157, when the people were conquered and baptized. King Eric left Bishop Henry with his priests and some soldiers behind to confirm the conquest and complete the conversion. After a time he was killed, canonized, and as St. Henry became the patron saint of Finland. As Sweden had to attend to her own affairs, Finland was gradually reverting to independence and paganism, when in 1209 another bishop and missionary, Thomas (also an Englishman), arrived, and recommenced the work of St. Henry. Bishop Thomas nearly succeeded in detaching Finland from Sweden, and forming it into a province subject only to the pope. The famous Birger Jarl undertook a crusade in Finland in 1249, compelling the Tavastians, one of the subdivisions of the Finlanders proper, to accept Christianity, and building a castle at Tavastehus. It was Torkel Knutson who conquered and connected the Karelian Finlanders in 1293, and built the strong castle of Wiborg. Almost continuous wars between Russia and Sweden were the result of the conquest of Finland by the latter. In 1323 it was settled that the river Rajajoki should be the boundary between Russia and the Swedish province. After the final conquest of the country by the Swedes, they spread among the Finlanders their civilization, gave them laws, accorded them the same civil rights as belonged to themselves, and introduced agriculture and other beneficial arts. The Reformed religion was introduced into Finland by Gustavus Vasa about 1528, and King John III. raised it to the dignity of a grand-duchy. The country suffered, sometimes deplorably, in most of the wars waged by Sweden, especially with Russia and Denmark. His predecessor having created an order of nobility,—counts, barons, and nobles—Gustavus Adolphus in the beginning of the 17th century established the diet of Finland, composed of the four orders of the nobility, clergy, bourgeois, and peasants. Gustavus and his successor did much for Finland by founding schools and gymnasia, building churches, encouraging learning, and introducing printing. During the reign of Charles XI. (1692–1696) the country suffered terribly from famine and pestilence; in the diocese of Åbo alone 60,000 persons died in less than nine months. Finland has been visited at different periods since by these scourges; so late as 1848 whole villages were starved during a dreadful famine. Peter the Great cast an envious eye on Finland and tried to wrest it from Sweden; in 1710 he managed to obtain possession of the towns of Keksholm and Villmanstrand; and by 1716 all the country was in his power. Meantime the sufferings of the people had been great; thousands perished in the wars of Charles XII. By the peace of Nystad in 1721 the province of Wiborg, the eastern division of Finland, was finally ceded to Russia. But the country had been laid very low by war, pestilence, and famine, though it recovered itself with wonderful rapidity. In 1741 the Swedes made an effort to recover the ceded province, but through wretched management suffered disaster, and were compelled to capitulate in August, 1742, ceding by the peace of Åbo, next year, the towns of Villmanstrand and Fredrikshamn. Nothing remarkable seems to have occurred till 1788, under Gustavus III., who began to reign in 1771, and who gave the Finlanders those fundamental laws by which they are still essentially governed. The country was divided into six governments, a second superior court of justice was founded at Wasa, many new towns were built, commerce flourished, and science and art were encouraged. Latin disappeared as the academic language, and Swedish was adopted. In 1788, however, war again broke out between Sweden and Russia, and was carried on for two years without much glory or gain to either party, the main aim of Gustavus being to recover the lost Finnish province. In 1808, under Gustavus IV., peace was again broken between the two countries, and the war ended by the cession in 1809 of the whole of Finland and the Åland Islands to Russia, which has ever since maintained her supremacy. The Finlanders themselves fought bravely against Russia, and it is said that bribery had not a little to do with the result. The emperor Alexander I. convoked the diet at Borgo in 1809, when he issued a manifesto undertaking to preserve the religion, laws, and liberties of the country. This pledge has been taken by his successors, and probably Finland is the freest and best governed part of the Russian empire. A senate was created and a governor-general named. The province of Wiborg was reunited to Finland in 1811, and Åbo remained the capital of the country till 1821, when the civil and military authorities were removed to Helsingfors, and the university in 1827. The diet, which had not met for 56 years, was convoked by Alexander II. at Helsingfors in 1863, and has met every five years since. Since 1860 Finland has been allowed the use of a coinage peculiar to itself. Under Alexander II. Finland has been on the whole prosperous and progressive. The use of the Finnish tongue is everywhere encouraged, though the upper classes mostly use Swedish, and the study of the Russian language was made compulsory in all the state schools in 1872.

Ethnology and Language.—The term Finns has a wider application than Finland, being, with its adjective Finnic or Finno-Ugric or Ugro-Finnic, the collective name of the westernmost branch of the great Uralo-Altaic family, dispersed throughout Finland, Lapland, the Baltic provinces (Esthonia, Livonia, Courland), parts of Russia proper (south of Lake Onega), both banks of middle Volga, Perm, Vologda, West Siberia (between the Ural Mountains and the Yenissei), and Hungary. It consists of five groups:—(1) the Finns proper; (2) the Lapps; (3) the Permian Finns; (4) Volga Finns; (5) Ugrian Finns. (1) The first group comprises the Suomi or Suomelaisset, *i. e.*, Fen-men, who occupy nearly all Finland except a portion on the Gulf of Bothnia, about Wasa, where Swedish is spoken; next, the Karelians, who extend from Russian Lapland south to the Gulf of Finland and Lake Ladoga, and east to the White Sea and the shores of Lake Onega; thirdly, the Chudic, a Slav term often applied to the whole group, but now restricted to the Veps or northern Chud and the Votic or southern Chud, dwelling in scattered communities round the shores of Lake Onega; and lastly, the Baltic Finns, including the Este or Esthonian, occupying the greater part of the southern coast of the Gulf of Finland and the northern half of Livonia, and the Livonian or Krevinian, occupying a small corner in the north-west of Courland. (2) The Lapps occupy the extreme north-west of Russia, and some parts of northern Sweden and Norway. (3) The Permian Finns comprise the Siryenians, occupying an extensive region between 60° N. lat. and the Arctic circle and 50° E. long. and the Ural Mountains, but mainly in the section of the government of Vologda; the Permian proper, formerly diffused throughout Perm, Viatka, Oufa, etc., now surviving in isolated communities mainly about the upper Kama; and the Votyak, occupying a relatively compact territory in Viatka as far north as Glazov on the river Tchepsa. (4) The Volga Finns include the Cheremissian on the left bank of the Volga, from a little west of Kazan to near Nijni-Novgorod; and the Mordvinian, divided into small communities on both banks of the Volga, about Simbirsk, Samara, Stavropol, and Tambov. (5) The Ugrian Finns include the Voguls, extending from the Ural Mountains east to near the river Obi and south to Tobolsk; the Ostyaks, from the Voguls east to the river Yenissei, between Turuchansk and Yenisseisk, and from the Arctic circle to 59° N. lat.; and the Magyars of Hungary. These five groups form one linguistic family, to which Samoyede is related. The richest and most highly cultivated languages of the family are the Suomi and Magyar. The dialects are all distinctly agglutinative forms of speech, with decided tendencies towards true inflection, so much so that in many grammatical endings the essential difference between agglutination and inflection becomes obscured. As in other Uralo-Altaic tongues, progressive vowel-harmony forms a characteristic feature of the Finnic group. Rask considered the Finnish language the most sonorous and harmonious of tongues. It is maintained by some that the Finnic languages represent the oldest forms among the Uralo-Altaic groups. There is strong evidence that the Finns, or a closely allied race, must have at one time, probably prehistoric, been spread over a considerable area of central if not of western Europe.

Originally nomads (hunters and fishers), all the Finnic people except the Lapps and Ostyaks have long yielded to the influence of civilization, and now everywhere lead settled lives as herdsmen, agriculturists, traders, etc. Physically the Finns are a strong, hardy race, of low stature, with almost round head, low forehead, flat features, prominent cheek bones, eyes mostly gray and oblique (inclining inwards), short and flat nose, protruding mouth, thick lips, neck very full and strong, so that the occiput seems flat and almost in a straight line with the nape; beard weak and sparse, hair no doubt originally black, but, owing to mixture with other races, now brown, red, and even fair; complexion also somewhat brown. The Finns are morally upright, hospitable, faithful, and submissive, with a keen sense of personal freedom and independence, but also somewhat stolid, revengeful, and indolent. Many of these physical and moral characteristics they have in common with the so-called "Mongolian" race, to which they are no doubt ethnically, if not also linguistically, related.

Literature.—Finland can boast of a varied literature more or less indigenous, the great monument of which is, however, the *Kalewala*, a sort of epic poem, which, until the present century, existed only in fragments in the memories and on the lips of the peasantry. A collection of these scattered songs was published in 1822 by Dr. Zacharias Topelius, but it was not till 1835 that anything like a complete and systematically arranged collection was given to the world by Dr. Elias Lönnrot. For years Dr. Lönnrot wandered from place to place in the most remote districts, living with the peasantry, and taking down from their lips all that they knew of their popular songs. After unwearied diligence he was successful in collecting 12,000 lines. These he arranged as methodically as he could into thirty-two runes or cantos, which he published exactly as he heard them sung or chanted. Continuing his researches, Dr. Lönnrot published in 1849 a new edition of 22,793 verses, in 50 runes. The importance of this indigenous epic, as it may be fairly styled, was at once recognized in Europe, and translations were made into Swedish, German, and French. A few specimens have also been translated into English by the late Professor A. Porter, of Yale College, and published at New York (1868). The best foreign editions are those of Castren in Swedish (1844), Leouzon le Duc in French (1845 and 1868), Schiefner in German (1852). The poem has besides given rise to a considerable amount of critical literature, which is worthy of the attention of the comparative mythologist. The poem is written in eight-syllabled trochaic verse, and an idea of its style may be obtained from Longfellow's *Hiawatha*, which is a pretty true imitation of the Finnish epic. Of the merits and importance of the poem Professor Max Müller, than whom there could be no better judge, speaks thus:—"From the mouths of the aged an epic poem has been collected, equalling the *Iliad* in length and completeness; nay—if we can forget for a moment all that *we* in our youth learned to call beautiful—not less beautiful. A Finn is not a Greek, and a Wainamoinen was not a Homer. But if the poet may take his colors from that nature by which he is surrounded, if he may depict the men with whom he lives, *Kalewala* possesses merits not dissimilar from those of the *Iliad*, and will claim its place as the fifth national epic of the world, side by side with the Ionian songs, with the *Mahábhárata*, the *Shahnámeh*, and the *Nibelunge*." The *Kalewala* is concerned entirely with the mythology or folk-lore of the people. In the story there is a certain unity of plot, though the various parts are not perfectly homogeneous, and are evidently the product of different minds at different times, the various songs having evidently received additions in course of time. Indeed, it is probable that the origin of the songs must be sought for in a time when the various branches of the Finns were not so scattered as they are now, certainly before their conversion to Christianity, though in the conclusion there seem to be one or two allusions to Christian subjects. The poem takes its name from the three heroes of Kaleva, the land of plenty and happiness, Wåinåmöinen, Ilmarinen, and Lemmin-Kåinen; it is the struggles of these with Louhi, Hüse, Yorukahainen, and others from Pohjola, a land of the cold north, and from Luonela, the land of death, that are sung. The poem begins with the creation of the world, and after many varied events, ends in the triumph of Wåinåmöinen and his followers. At the time that Dr. Lönnrot collected the Kalewala songs he also collected a considerable quantity of lyric poetry, which he published under the name of *Kanteletar*, from the name of the national instrument to which they are sung—*Kantele*, a species of harp with five strings. Of recent poets the most popular seems to be Paavo Korrhoinen, a peasant whose productions are characterized by sharp and biting sarcasm. His songs were published at Helsingfors in 1848. Other modern poets are Marteska, Kettunen, Ilahainen, Oksaselta. The Finns are strong in proverbs, Lönnrot having published a collection of upwards of 7000, with about 2000 charades, while considerable collections of legends and tales have been published.

The first book printed in Finnish was in the middle of the 16th century, and was probably the *Abecedarium* (1543) of Michael Agricola, bishop of Åbo. A translation of the New Testament by the same bishop appeared in 1548, at Stockholm. The whole Bible was not translated into Finnish till 1642. Even during last, but especially during the present century, there has been considerable literary activity in Finland, so that now books in almost every branch of research are found in the language, mainly translations or adaptations. We meet with, during the present century, a considerable number of names of poets and dramatists, no doubt very minor, as also painters, sculptors, and musical composers. At the Paris International Exhibition of 1878 several native Finnish painters and sculptors exhibited works which would do credit to any country; and both in the fine and applied arts Finland occupied a position thoroughly creditable. An important contribution to a history of Finnish litterature is Krohn's *Suomenkielinen runollisuus ruotsinvallan aikana* (1862). Finland is wonderfully rich in periodicals of all kinds, the publications of the Finnish Societies of Literature and of Sciences and other learned bodies being specially valuable. The Finnish Literary Society has within the last few years published a new edition of the works of the father of Finnish history, Henry Gabriel Porthan (died 1804). A valuable handbook of Finnish history was published at Helsingfors in 1869–73, by Yrjö Koskinen, and has been translated into both Swedish and German. The author, however, is understood to be really a Swede, whose name is Georg Forsman, the above form being a Finnish translation. Other works on Finnish history have also appeared within the last four or five years. Some important works in Finnish geography have also appeared during the same period. In language we have Lönnrot's great Finnish-Swedish dictionary, now being published by the Finnish Literary Society. In this connection the student may be glad to know of Dr. Donner's *Comparative Dictionary of the Finno-Ugric Languages* (Helsingfors and Leipsic), in German. In other departments works of importance have not been infrequent during the present decade; most of them apparently are in Swedish. A valuable sketch of recent Finnish literature will be found in the *Russische Revue* (iv. Jahrgang, 4 and 6 Hefte). (J. S. K.)

FINLAY, GEORGE (1799–1875), the historian of Greece "from its conquest by the Romans to the present time," was born of Scottish parents at Faversham, Kent, on the 21st of December, 1799. His father, Major John Finlay, R.E., F.R.S., who had held for some time the post of inspector of the Government powder-mills at Faversham and Waltham Abbey, died when George was still very young (1802); but the boy has left on record how his interest in historical studies was awakened at a very early age by the manner in which his mother used to explain the history of England. On the second marriage of his mother, he was sent to a boarding-school near Liverpool, where he spent three years,—not very profitably, according to his own account. Afterwards his education was continued in more favorable circumstances under a private tutor in the house of his uncle, Mr. Kirkman Finlay, who at that time sat as member of parliament for the Glasgow district of burghs. While making good progress in his literary education, he at the same time laid up pleasant and life-long memories of the boating, fishing, and pedestrian excursions for which the picturesque shores of the Firth of Clyde offer so many delightful facilities. At one time he had entertained thoughts of entering the army; but having been dissuaded from this by his friends, he ultimately, at the close of his university curriculum in arts, made choice of the legal profession. He received his preliminary technical training in a writer's office in Glasgow, and, when little over twenty years of age, went to Göttingen to complete his studies in Roman law. But before this time he had begun to feel a deep interest in the contemporary affairs of Greece, and at the Hanoverian university he was wholly unable to withdraw his attention from the stirring drama which was then being unfolded in the south-eastern corner of Europe. "I conversed much," he says, "with everybody I met who had visited Greece, read all the works of modern travellers, and associated a great deal with the only Greek who was then studying at Göttingen." In 1823 he resolved to visit the country personally, in order that he might judge for himself of the condition of the people and the prospects of the war. In November accordingly he arrived in Cephalonia, where he first met Lord Byron, by whom, as well as by Sir Charles Napier, the British resident, he was very kindly received. Shortly afterwards he was landed at Pyrgos, and during the next fourteen months, which were spent partly at Athens and partly at Missolonghi, he greatly improved his knowledge of the language, history, and antiquities of the country. While soon led to form a very unfavorable opinion of the rapacity, selfishness, and incompetency of the Greek leaders, both civil and military, he by no means lost his enthusiasm for the cause of Greek independence. A severe attack of fever, however, combined with other circumstances to make a change of scene desirable in December, 1824. The rest of that winter accordingly and the spring of 1825 were spent in Rome, Naples, and Sicily. After spending a summer at Castle Toward, Argyllshire, he went to Edinburgh, where he attended classes in the university, and passed his examination in civil law with a view to being called to the Scottish bar. His unquenched enthusiasm for Greece, however, made it impossible for him to resist the pressing invitation of his friend Hastings that he should return to that country, and thenceforward, if we except a few brief journeys (one to England in 1826 in order to secure the services of some competent engineers), the remainder of his life was wholly spent in the land of his adoption. He took part in the unsuccessful operations of Lord Cochrane and Sir Richard Church for the relief of Athens in 1827. When independence had been secured in 1829, under the presidency of Capodistrias, he was induced by the prospect of peaceful progress to buy a landed estate in Attica, hoping in this way to aid in putting the country "into the road that leads to a rapid increase of production, population, and material improvement." These hopes were not realized; all his efforts for the introduction of a better system of agriculture ended in failure; within a very few years he found that he had lost his capital as well as his labor in his generous but ill-rewarded enthusiasm. Only when it had become too plain to him that Greece could be served in no other way, did he form the resolve of giving himself to the literary work which occupied, somewhat sadly, all the remainder of his life. "Had the hopes with which I joined the cause of Greece in 1823 been fulfilled, it is not probable that I should have abandoned the active duties of life, and the noble task of laboring to improve the land, for the sterile task of recording its misfortunes." So he writes in 1855. His first publications were *The Hellenic Kingdom and the Greek Nation* (London, 1836); *Essai sur les principes de banque appliqués à l'état actuel de la Grèce* (Athens, 1836); and *Remarks on the Topography of Oropia and Diacria, with a map* (Athens, 1838). The first instalment of his great historical work appeared in 1844 (the 2d edition in 1857) under the title *Greece under the Romans: a Historical View of the Condition of the Greek Nation from the time of its Conquest by the Romans until the Extinction of the Roman Empire in the East.* Meanwhile he had been qualifying himself still further for his task by travel as well as by reading; he undertook several tours (one in the company of Karl Ritter) to various quarters of the Levant; and as the result of one of them he published a volume *On the Site of the Holy Sepulchre; with a plan of Jerusalem* (London, 1847). The *History of the Byzantine and Greek Empires from 716–1403* was completed in 1854. It was speedily followed by the *History of Greece under Othoman and Venetian Domination* (1856), and by the *History of the Greek Revolution* (Edinburgh, 1861). In weak health, and conscious of failing energy, he now gave the last years of his life to the task of revising, supplementing, and partly rewriting his great work. From 1864 to 1870 he was also correspondent of the *Times* newspaper, and at various periods he contributed articles to *Blackwood's Magazine*, the *Athenæum*, and the *Saturday Review*. He was a member of several learned societies; and in 1854 he received from the university of Edinburgh the honorary degree of LL.D. He died at Athens on the 26th of January, 1875. A new edition of his *History*, "revised throughout, and in part rewritten, with considerable additions, by the author, and edited by the Rev. H. F. Tozer, M.A.," with a portrait by Jeens, was issued from the Oxford Clarendon press in 1877. It includes a brief but extremely interesting fragment of an autobiography of the author. As an historian Finlay had the merit, which was also to some extent the advantage, of entering upon a field of research that had been previously wholly neglected by English writers, Gibbon alone being a partial exception. He brought to his work many admirable qualities; as a student he was laborious, as a scholar he was accurate, as a thinker he was both acute and profound; and in all that he wrote he was unswerving in his loyalty to the principles of constitutional government and to the cause of liberty and justice. The portion of his work which extends from 146 B.C. to 1453 A.D. has been translated into German.

FIORENZUOLA, a small town of Italy, in the province of Piacenza, about 13 miles from the city of that name, on the right of the Arda, which is there crossed by a noble bridge. The ancient towers in the piazza, the collegiate church of S. Fiorenzo with its beautiful carved work, and the old Palazzo Grossi are the principal objects of interest. The town is of no small antiquity, and in the 9th century it was the scene of a sanguinary battle between Berenger of Italy and Rudolph II. of Burgundy. The Scotti, the Visconti, the Pallavicini, and the Farnesi were successively in possession of the fee. In the vicinity are the ruins of the old city of Veleia, which was overthrown by a landslip in the 4th century. Population of the town in 1871, 3295; of the commune, 6730.

FIORILLO, Johann Dominicus (1748–1821), German painter and historian of art, was born at Hamburg, October 13, 1748. He received his first instructions in art at an academy of painting at Baireuth; and in 1761, to continue his studies, he went first to Rome, where for four years he was the pupil of Batoni, and next to Bologna, where he studied under Bigari and Dulli. He distinguished himself sufficiently to attain in 1769 admission to the academy of that city. Returning soon after to Germany, he obtained the appointment of historical painter to the court of Brunswick. In 1781 he removed to Göttingen, occupied himself as a drawing-master, and was named in 1784 keeper of the collection of prints at the university library. He was appointed professor extraordinary in the philosophical faculty in 1799, and ordinary professor in 1813. During this period he had made himself known as a writer by the publication of his *Geschichte der zeichnenden Künste*, in 5 vols. (1798–1808). This was followed in 1815 to 1820 by the *Geschichte der zeichnenden Künste in Deutschland und den vereinigten Niederlanden*, in 4 vols. These works, though not attaining to any high mark of literary excellence, are esteemed for the information collected in them, especially on the subject of art in the later Middle Ages. Fiorillo practised his art almost till his death, but has left no memorable masterpiece. The most noticeable of his paintings is perhaps the Surrender of Briseis. He died at Göttingen, September 10, 1821.

FIR, the name originally given by our Scandinavian forefathers to the Scotch pine (*Pinus sylvestris*), is at present not unfrequently employed as a general term for the whole of the true Conifers (*Abietinæ*); but in a more exact sense, it has been transferred to the "spruce" and "silver firs," the genera *Abies* and *Picea* of most modern botanists.

The firs are distinguished from the pines and larches by having their needle-like leaves placed singly on the shoots, instead of growing in clusters from a sheath or abortive branch. Their cones are composed of thin, rounded, closely-imbricated scales, furnished in some species with bracts springing from the base. The trees have usually a straight trunk, and a tendency to a conical or pyramidal growth,—throwing out each year a more or less regular whorl of branches from the foot of the leading shoot, while the buds of the lateral boughs extend horizontally.

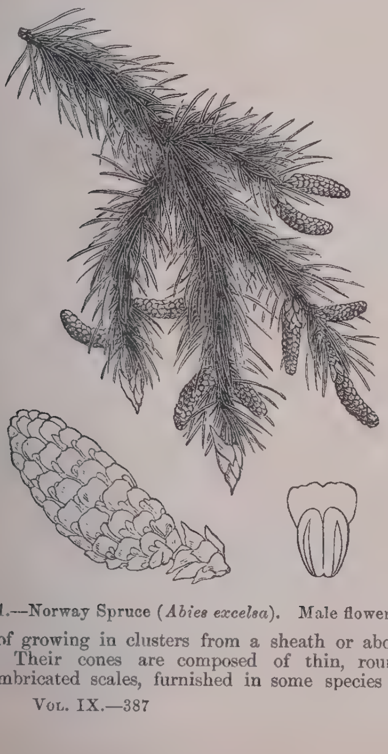

Fig. 1.—Norway Spruce (*Abies excelsa*). Male flowers.

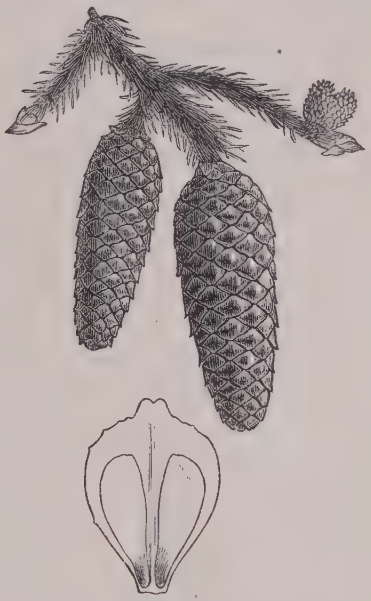

Fig. 2.—Norway Spruce (*Abies excelsa*). Cones; scales with seeds.

In the Spruce Firs (*Abies*), the cones are pendent when mature and their scales persistent; the leaves are arranged all round the shoots, though the lower ones are sometimes directed laterally. In the sub-genus *Picea*, the Silver Firs, the cones are erect, and their scales drop off when the seed ripens; the leaves are placed in distinct rows on each side of the shoot.

The most important of the firs, in an economic sense, is the Norway Spruce (*Abies excelsa*), so well known in British plantations, though rarely attaining there the gigantic height and grandeur of form it often displays in its native woods. Under favorable circumstances of growth it is a lofty tree, with a nearly straight, tapering trunk, throwing out in somewhat irregular whorls its wide-spreading branches, densely clothed with dark, clear-green foliage. The boughs and their side-branches, as they increase in length, have a tendency to droop, the lower tier, even in large trees, often sweeping the ground,—a habit that, with the jagged sprays, and broad, shadowy, wave-like foliage masses, gives a peculiarly graceful and picturesque aspect to the Norway spruce. The slender, sharp, slightly curved leaves are scattered thickly around the shoots; the upper ones pressed towards the stem, and the lower directed sideways, so as to give a somewhat flattened appearance to the individual sprays. The elongated, cylindrical cones grow chiefly at the ends of the upper branches; they are purplish at first, but become afterwards green, and eventually light brown; their scales are slightly toothed at the extremity; they ripen in the autumn, but seldom discharge their seeds until the following spring.

The tree is very widely distributed, growing abundantly on most of the mountain ranges of northern and central Europe; while in Asia it occurs at least as far east as the Lena, and in latitude extends from the Altaic ranges to beyond the Arctic circle. On the Swiss Alps it is one of the most prevalent and striking of the forest trees, its dark evergreen foliage often standing out in strong contrast to the snowy ridges and glaciers beyond. In the lower districts of Sweden it is the predominant tree in most of the great forests that spread over so large a portion of that country. In Norway it constitutes a considerable part of the dense woods of the southern dales, flourishing, according to Schübeler, on the mountain slopes up to an altitude of from 2800 to 3100 feet, and clothing the shores of some of the fjords to the water's edge; in the higher regions it is generally mingled with the pine. Less abundant on the western side of the fjelds, it again forms woods in Nordland, extending in the neighborhood of the coast nearly to the 67th parallel; but it is, in that arctic climate, rarely met with at a greater elevation than 800 feet above the sea, though in Swedish Lapland it is found on the slope of the Sulitelma as high as 1200 feet, its upper limit being everywhere lower than that of the pine. In all the Scandinavian countries it is known as the *Gran* or *Grann.* Great tracts of low country along the southern shores of the Baltic and in northern Russia are covered with forests of spruce. It everywhere shows a preference for a moist but well-drained soil, and never attains its full stature or luxuriance of growth upon arid ground, whether on plain or mountain—a peculiarity that should be remembered by the planter. In a favorable soil and open situation it becomes the tallest and one of the stateliest of European trees, rising sometimes to a height of from 150 to 170 feet, the trunk attaining a diameter of from 5 to 6 feet at the base. But when it grows in dense woods, where the lower branches decay and drop off early, only a small head of foliage remaining at the tapering summit, its stem, though frequently of great height, is rarely more than 1½ or 2 feet in thickness. Its growth is rapid, the straight leading shoot, in the vigorous period of the tree, often extending 2½ or even 3 feet in a single season. In its native habitats it is said to endure for several centuries; but in those countries from which the commercial supply of its timber is chiefly drawn, it attains perfection in from 70 to 90 years, according to soil and situation.

In the most prevalent variety of the Norway spruce the wood is white, apt to be very knotty when the tree has grown in an open place, but, as produced in the close northern forests, often of fine and even grain. Immense quantities are imported into Britain from Norway, Sweden, and Prussia, under the names of "white Norway," "Christiania," and "Danzig deal." The larger trees are sawn up into planks and battens, much used for the purposes of the builder, especially for flooring, joists, and rafters. Where not exposed to the weather, the wood is probably as lasting as that of the pine, but, not being so resinous, appears less adapted for out-door uses. Of late years great quantities have been sent from Sweden in a manufactured state, in the form of door- and window-frames and ready-prepared flooring, and much of the cheap "white deal" furniture is made of this wood. The younger and smaller trees are remarkably durable, especially when the bark is allowed to remain on them; and most of the poles imported into Britain for scaffolding, ladders, mining-timber, and similar uses are furnished by this fir. Small masts and spars are often made of it, and are said to be lighter than those of pine. The best poles, according to Monteath, are obtained in Norway from small, slender, drawn-up trees, growing under the shade of the larger ones in the thick woods, these being freer from knots, and tougher from their slower growth. A variety of the spruce, abounding in some parts of Norway, produces a red heart-wood, not easy to distinguish from that of the Norway pine (Scotch fir), and imported with it into England as "red deal" or "pine." This kind is sometimes seen in plantations, where it may be recognized by its shorter, darker leaves, and longer cones. The smaller branches and the waste portion of the trunks, left in cutting up the timber, are exported as fire-wood, or used for splitting into matches, an industry that has lately sprung up in Sweden. Recently, the wood of the spruce has been employed in the manufacture of paper-stuff, being first reduced to a state of fine division, and then deprived of its resin by long boiling in alkaline solutions,—an application that will probably be considerably extended with the wider employment of paper-pulp in the useful arts.

The resinous products of the Norway spruce, though yielded by the tree in less abundance than those furnished by the pine, are of considerable economic value. In Scandinavia a thick turpentine oozes from cracks or fissures in the bark, forming by its congelation a fine yellow resin, known commercially as "spruce rosin," or "frankincense;" it is also procured artificially by cutting off the ends of the lower branches, when it slowly exudes from the extremities. In Switzerland and parts of Germany, where it is collected in some quantity for commerce, a long strip of bark is cut out of the tree near the root; the resin, that slowly accumulates during the summer, is scraped out in the latter part of the season, and the slit enlarged slightly the following spring to insure a continuance of the supply. The process is repeated every alternate year, until the tree no longer yields the resin in abundance, which under favorable circumstances it will do for twenty years or more. The quantity obtained from each fir is very variable, depending on the vigor of the tree, and greatly lessens after it has been subjected to the operation for some years. Eventually the tree is destroyed, and the wood rendered worthless for timber, and of little value even for fuel. From the product so obtained most of the better sort of "Burgundy pitch" of the druggists is prepared. The resin collected from the fir is melted and boiled in water, then filtered through a sackcloth bag, and left to congeal in a cask beneath; nearly half the original amount of resin is obtained in this purified condition. Its chief employment is for plasters, much used in disorders of the chest and other complaints in which a mild stimulant to the skin is required. It is often applied in conjunction with the spruce-rosin itself and other ingredients. Much of the so-called Burgundy pitch of the shops is, according to Pereira, a compound of common rosin, palm oil, and water. By distillation with water the resin of the spruce yields oil of turpentine; but only a comparatively small quantity of that of commerce is obtained from this source, and it is considered inferior to that yielded by the pine and larch. By the peasantry of its native countries the Norway spruce is applied to innumerable purposes of daily life. The bark and young cones afford a tanning material, inferior, indeed, to oak-bark, and hardly equal to that of the larch, but of value in countries where substances more rich in tannin are not abundant. In Norway the sprays, like those of the juniper, are scattered over the floors of churches and the sitting-rooms of dwelling-houses, as a fragrant and healthful substitute for carpet or matting. The young shoots are also given to oxen in the long winters of those northern latitudes, when other green fodder is hard to obtain. In times of scarcity the Norse peasant-farmer uses the sweetish inner bark, beaten in a mortar and ground in his primitive mill with oats or barley, to eke out a scanty supply of meal, the mixture yielding a tolerably palatable though somewhat resinous substitute for his ordinary *flad-brod.* A decoction of the buds in milk or whey is a common household remedy for scurvy; and the young shoots or green cones form an essential ingredient in the spruce beer drank with a similar object, or as an occasional beverage. The well-known "Danzig-spruce" is prepared by adding a decoction of the buds or cones to the wort or saccharine liquor before fermentation. Similar preparations are in use wherever the spruce fir abounds. The wood is burned for fuel, its heat-giving power being reckoned in Germany about one-fourth less than that of beech. From the wide-spreading roots string and ropes are manufactured in Lapland and Bothnia: the longer ones which run near the surface are selected, split through, and then boiled for some hours in a ley of wood-ashes and salt, which, dissolving out the resin, loosens the fibres and renders them easily separable, and ready for twisting into cordage. Light portable boats are sometimes made of very thin boards of fir, sewn together with cord thus manufactured from the roots of the tree.

The Norway spruce seems to have been the "Picea" of Pliny, but is evidently often confused by the Latin writers with their "Abies," the *Picea pectinata* of modern botanists. From an equally loose application of the word "fir" by our older herbalists, it is difficult to decide upon the date of introduction of this tree into Britain; but it was commonly planted for ornamental purposes in the beginning of the 17th century. In places suited to its growth it seems to flourish nearly as well as in the woods of Norway or Switzerland; but as it needs for its successful cultivation as a timber tree soils that might be turned to agricultural account, it is not so well adapted for economic planting in Britain as the Scotch fir or larch, which come to perfection in more bleak and elevated regions, and on comparatively barren ground, though it may perhaps be grown to advantage on some moist hill-sides and mountain hollows. Its great value to the English forester is as a "nurse" for other trees, for which its dense leafage and tapering form render it admirably fitted, as it protects, without overshading, the young saplings, and yields salable stakes and small poles when cut out. For hop-poles it is not so well adapted as the larch. As a picturesque tree, for park and ornamental plantation, it is among the best of the conifers, its color and form contrasting yet harmonizing with the olive green and rounded outline of oaks and beeches, or with the red trunk and glaucous foliage of the pine. When young its spreading boughs form good cover for game. The fresh branches, with their thick mat of foliage, are useful to the gardener for sheltering wall-fruit in the spring. In a good soil and position the tree sometimes attains an enormous size: one in Studley Park, Yorkshire, was, a few years back, nearly 140 feet in height, and the trunk more than 6 feet in thickness near the ground. The spruce bears the smoke of great cities better than most of the *Abietinæ;* but in suburban localities after a certain age it soon loses its healthy aspect, and is apt to be affected with blight (*Eriosoma*), though not so much as the Scotch fir and most of the pines.

The Black Spruce (*Abies nigra*) is a tree of more formal growth than the preceding. The branches grow at a more acute angle and in more regular whorls than those of the fir of Norway; and, though the lower ones become bent to a horizontal position, they do not droop, so that the tree has a much less elegant appearance. The leaves, which grow very thickly all round the stem, are short, nearly quadrangular, and of a dark grayish green. The cones, produced in great abundance, are short and oval in shape, the scales with rugged indented edges; they are deep purple when young, but become brown as they ripen. The tree abounds throughout New England, Nova Scotia, and all the countries around the St. Lawrence, in Canada growing up to 65°,—in all these regions often forming a large part of the dense forests. A variety with lighter foliage and reddish bark is common in Newfoundland and some districts on the mainland adjacent. The trees usually grow very close together, the slender trunks rising to a great height bare of branches; but they do not attain the size of the Norway spruce, being seldom taller than 60 or 70 feet, with a diameter of 1½ or 2 feet at the base. This species prefers a peaty soil, and often grows luxuriantly in very moist situations. The wood is strong, light, and very elastic, forming an excellent material for small masts and spars, for which purpose the trunks are used in America, and exported largely to England. The sawn timber is inferior to that of *A. excelsa*, besides being of a smaller size. In the countries in which it abounds, the log-houses of the settlers are often built of the long straight trunks. The spruce-beer of America is generally made from the young shoots of this tree. The small twigs, tied in bundles, are boiled for some time in water with broken biscuit or roasted grain; the resulting decoction is then poured into a cask with molasses, or maple sugar, and a little yeast, and left to ferment. It is often made by the settlers and fishermen of the St. Lawrence countries, being esteemed as a preventive of scurvy. The American "essence of spruce," occasionally used in England for making spruce-beer, is obtained by boiling the shoots and buds and concentrating the decoction. The resinous products of the tree are of no great value.

The White Spruce (*Abies alba*), sometimes met with in English plantations, is a tree of lighter growth than the black spruce, the branches being more widely apart; the foliage is of a light glaucous green; the small light-brown cones are more slender and tapering than in *A. nigra*, and the scales have even edges. It is of comparatively small size, but is of some importance in the wilds of the Canadian dominion, where it is found further north than any other tree, growing up to at least 69°; the slender trunks yield the only useful timber of some of the more desolate northern regions. In the woods of Canada it occurs frequently, mingled with the black spruce and other trees. The fibrous tough roots, softened by soaking in water, and split, are used by the Indians and voyageurs to sew together the birch-bark covering of their canoes; and a resin that exudes from the bark is employed to varnish over the seams.

The Hemlock Spruce (*A. canadensis*) is a large tree, abounding in most of the north-eastern parts of America up to Labrador; in Lower Canada, New Brunswick, and Nova Scotia it is often the prevailing tree. The short leaves are flat, those above pressed close to the stem, and the others forming two rows; they are of a rather light green tint above, whitish beneath. The cones are very small, ovate, and pointed. The large branches droop, like those of the Norway spruce, but the sprays are much lighter and more slender, rendering the tree one of the most elegant of the conifers, especially when young. When old, the branches broken and bent down by the winter snows, give it a ragged but very picturesque aspect. The trunk is frequently three feet thick near the base. The hemlock prefers rather dry and elevated situations, often forming woods on the declivities of mountains. The timber is very much twisted in grain, and liable to warp and split, but is used for making plasterers' laths and for fencing; "shingles" for roofing are sometimes made of it. The bark, split off in May or June, forms one of the most valuable tanning substances in Canada. The sprays are sometimes used for making spruce-beer and essence of spruce.

The Douglas Spruce (*A. Douglasii*) is one of the finest trees of the genus, often rising to a height of 200 feet and sometimes considerably more, while the gigantic trunk frequently measures 8 or 10 feet across. The yew-like leaves spread laterally, and are of a deep green tint; the cones are furnished with tridentate bracts that project far beyond the scales. It forms extensive forests in Vancouver's Island, British Columbia, and Oregon, whence the timber is exported, being highly prized for its strength, durability, and even grain, though very heavy; it is of a deep yellow color, abounding in resin, which oozes from the thick bark. It was introduced into Britain soon after its discovery by Douglas, and has been planted in some parts of the kingdom experimentally, but does not appear to flourish well in the climate of England generally, though individual plants may be occasionally seen in good condition in ornamental shrubberies.

Of the *Picea* group, the Silver Fir (*P. pectinata*) may be taken as the type,—a lofty tree, rivalling the Norway spruce in size, with large spreading horizontal boughs curving upward towards the extremities. The flat leaves are arranged in two regular, distinct rows; they are deep green above, but beneath have two broad white lines, which, as the foliage in large trees has a tendency to curl upwards, give it a silvery appearance from below. The large cones stand erect on the branches, are cylindrical in shape, and have long bracts, the curved points of which project beyond the scales. When the tree is young the bark is of a silvery gray, but gets rough with age. This tree appears to have been the true "Abies" of the Latin writers—the "pulcherrima abies" of Virgil. From early historic times it has been held in high estimation in the south of Europe, being used by the Romans for masts and all purposes for which timber of great length was required. It is at present abundant in most of the mountain ranges of southern and central Europe, but is not found in the northern parts of that continent. In Asia it occurs on the Caucasus and Ural, and in some parts of the Altaic chain. Extensive woods of this fir exist on the southern Alps, where the tree grows up to nearly 4000 feet; in the Rhine countries it forms great part of the extensive forest of the Hochwald, and occurs in the Black Forest and in the Vosges; it is plentiful likewise on the Pyrenees and Apennines. The wood is inferior to that of *Abies excelsa*, but, being soft and easily worked, is largely employed in the countries to which it is indigenous for all the purposes of carpentry. Articles of furniture are frequently made of it, and it is in great esteem for carving and for the construction of stringed instruments. Deficient in resin, the wood is more perishable than that of the spruce fir when exposed to the air, though it is said to stand well under water. The bark contains a large amount of a fine, highly-resinous turpentine, which collects in tumors on the trunk during the heat of summer. In the Alps and Vosges, this resinous semi-fluid is collected by climbing the trees, and pressing out the contents of the natural receptacles of the bark into horn or tin vessels held beneath them. After purification by straining, it is sold as "Strasburg turpentine," much used in the preparation of some of the finer varnishes. Burgundy pitch is also prepared from it by a similar process as that from *Abies excelsa.* A fine oil of turpentine is distilled from the crude material; the residue forms a coarse rosin. Introduced into Britain in the 17th century, the silver fir has become common there as a planted tree, though, like the Norway spruce, it rarely comes up from seed scattered naturally. There are many fine trees in Scotland; one near Roseneath, figured by Strutt in his *Sylva Britannica*, then measured more than 22 feet round the trunk. In the more southern parts of the island it often reaches a height of 90 feet, and specimens exist considerably above that size; but the young shoots are apt to be injured in severe winters, and the tree on light soils is also hurt by long droughts, so that it usually presents a ragged appearance; though, in the distance, the lofty top and horizontal boughs sometimes stand out in most picturesque relief above the rounded summits of the neighboring trees. The silver fir flourishes in a deep loamy soil, and will grow even upon stiff clay, when well drained—a situation in which few conifers will succeed. On such lands, where otherwise desirable, it may sometimes be planted with profit. The cones do not ripen till the second year.

The Silver Fir of Canada (*P. balsamea*), a small tree resembling the last species in foliage, furnishes the "Canada balsam" used in medicine, and highly valued by the microscopist as a "mounting" medium. It is obtained from natural swellings or receptacles in the bark, like the resin of the common silver fir. The tree abounds in Lower Canada and the adjacent provinces.

Numerous other firs are common in gardens and shrubberies, and some furnish valuable products in their native countries; but they are not yet of sufficient economic or general interest to demand mention here. (C. P. J.)

FIRDOUSÍ. Abu 'l Cásim Mansúr who took the *nom de plume* of Firdousí, was a Persian poet of great eminence, and is chiefly known to European readers by his magnificent epic poem the *Shahnamah*, or "Book of Kings," a complete history of Persia in nearly 60,000 verses. He was born at Shadab, a suburb of Tús, about the year 329 of the Hegira (941 A.D.). His father, Maulana Ahmed, son of Maulana Fakhr-ed-dín el Firdousí, belonged to the class of *Dihkans* (the old native country families and landed proprietors of Persia, who had preserved their influence and status under the Arab rule), and possessed an estate in the neighborhood of Tús. Firdousí's own education eminently qualified him for the gigantic task which he subsequently undertook, for he was profoundly versed in the Arabic language and literature, and had also studied deeply the Pehlavi or Old Persian, and was conversant with the ancient historical records which existed in that tongue. As his history is intimately connected with that of the grand epic which he composed, it will be necessary to say a few words concerning the origin of the latter and the nature of the authorities from which it was compiled.

An epic poem, properly so called, is a collection of the ballads and songs, in which the memory of heroic deeds is always preserved in the earlier periods of a people's history, thrown by the rhapsodists into a connected and consecutive form. To become national and to take hold on the people's hearts it must contain nothing but the genuine national legends and traditions, and must have grown spontaneously. Many attempts have been made by poets of different nations to create a national epic, but they have always failed for the lack of the elements above referred to. Homer's *Iliad* and Virgil's *Æneid* are typical specimens of the real and spurious epic,—the former breathing in every line the true spirit of the Hellenic nation, and always rousing the national enthusiasm and appealing to the national feeling; the latter never having been regarded by the Latin race with any deeper feeling than that of admiration for its literary merits. The *Shahnamah* of Firdousí is perhaps the only exception of a poem produced by a single author, and at once taking its place as the national epic of the people. The nature of the work, the materials from which it was composed, and the circumstances under which it was written are, however, in themselves exceptional, and necessarily tended to this result. The grandeur and antiquity of the empire and the vicissitudes through which it passed, their long series of wars and the magnificent monuments erected by their ancient sovereigns, could not fail to leave numerous traces in the memory of so imaginative a people as the Persians.

As early as the 5th century of the Christian era we find mention made of these historical traditions in the work of an Armenian author, Moses of Khorene. During the reign of Naushirwan, the contemporary of Mahomet, and by order of that monarch, an attempt had been made to collect, from various parts of the kingdom, all the popular tales and legends relating to the ancient kings, and the results were deposited in the royal library. Under the last sovereign of the Sassanian dynasty, Yezdegird, the work was resumed, the former collection being revised and greatly added to by the Dihkan Danishwer, assisted by several learned mobeds. His work was entitled the *Khodai-nameh*, which in the old dialect also meant the "Book of Kings." On the Arab invasion this work was in great danger of perishing at the hands of the iconoclastic caliph Omar and his generals, but it was fortunately preserved; and we find it in the 2d century of the Hegira being paraphrased in Arabic by Abdallah ibn el Mokaffa, a learned Persian who had embraced Islam. Other Guebres occupied themselves privately with the collection of these traditions; and, when a prince of Persian origin, Yakúb ibn Leith, founder of the Soffaride dynasty, succeeded in throwing off his allegiance to the caliphate, he at once set about continuing the work of his illustrious predecessors. His "Book of Kings" was completed in the year 260 of the Hegira, and was freely circulated in Khorassan and Irak. Yakúb's family did not continue long in power; but the Samanian princes, descendants of the Sassanians, who succeeded them, applied themselves zealously to the same work, and entrusted it to the poet Dakiki himself, a Guebre by religion. Dakiki's labors were brought to a sudden stop by his own assassination, and the fall of the Samanian house happened not long after, and their kingdom passed into the hands of the Ghaznavides. Mahmúd ibn Sebuktagin, the second of the dynasty (667–1030 A.D.), continued to make himself still more independent of the caliphate than his predecessors, and, though a warrior and a fanatical Moslem, extended a generous patronage to Persian literature and learning, and even developed it at the expense of the Arabic institutions. The task of continuing and completing the collection of the ancient historical traditions of the empire especially attracted him. With the assistance of neighboring princes and of many of the influential Dihkans, Mahmud collected a vast amount of materials for the work, and after having searched in vain for a man of sufficient learning and ability to edit them faithfully, and having entrusted various episodes for versification to the numerous poets whom he had gathered round him, he at length made choice of Firdousí. Firdousí had been always strongly attracted by the ancient Pehlavi records, and had begun at an early age to turn them into Persian epic verse. On hearing of the death of the poet Dakiki, he conceived the ambitious design of himself carrying out the work which the latter had only just commenced; and, although he had not then any introduction to the court, he contrived, thanks to one of his friends, Mohammed Lashkari, to procure a copy of the Dihkan Danishwer's collection, and at the age of thirty-six commenced his great undertaking. Abu Mansour, the governor of Tús, patronized him and encouraged him by substantial pecuniary support. When Mahmud succeeded to the throne, and evinced such active interest in the work, Firdousí was naturally attracted to the court of Ghaznin. At first court jealousies and intrigues prevented Firdousí from being noticed by the sultan; but at length one of his friends, Mahek, undertook to present to Mahmud his poetic version of one of the well-known episodes of the legendary history. Hearing that the poet was born at Tús, the sultan made him explain the origin of his native town, and was much struck with the intimate knowledge of ancient history which he displayed. Being presented to the seven poets who were then engaged on the projected epic, Abu 'l Cásim was admitted to their meetings, and on one occasion improvised a verse, at Mahmud's request, in praise of his favorite Ayáz, with such success that the sultan bestowed upon him the name of Firdousí, saying that he had converted his assemblies into paradise (*Firdous*). During the early days of his sojourn at court, an incident happened which contributed in no small measure to the realization of his ambition. Three of the seven poets were drinking in a garden when Firdousí approached, and wishing to get rid of him without rudeness, they informed him who they were, and told him that it was their custom to admit none to their society but such as could give proof of poetical talent. To test his acquirements they proposed that each should furnish an extemporary line of verse, his own to be the last, and all three ending in the same rhyme. Firdousí accepted the challenge, and the three poets having previously agreed upon three rhyming words to which a fourth could not be found in the Persian language, 'Ansari began—

> Thy beauty eclipses the light of the sun;

Farrakhi added—

> The rose with thy cheek would comparison shun;

'Asjadi continued—

> Thy glances pierce through the mailed warrior's johsun ;[1]

and Firdousí, without a moment's hesitation, completed the quatrain—

> Like the lance of fierce Giv in his fight with Poshun.

The poets asked for an explanation of this allusion, and Firdousí recited to them the battle as described in the *Shahnamah*, and delighted and astonished them with his learning and eloquence.

Mahmud now definitely selected him for the work of compiling and versifying the ancient legends, and bestowed upon him such marks of his favor and munificence as to elicit from the poet an enthusiastic panegyric, which is inserted in the preface of the *Shahnamah*, and forms a curious contrast to the bitter satire which he subsequently prefixed to the book. The sultan ordered his treasurer, Khojah Hasan Meimendi, to pay to Firdousí a thousand gold pieces for every thousand verses; but the poet preferred allowing the sum to accumulate till the whole was finished, with the object of amassing sufficient capital to construct a dike for his native town of Tús, which suffered greatly from defective irrigation, a project which had been the chief dream of his childhood. Owing to this resolution, and to the jealousy of Hasan Meimendi, who often refused to advance him sufficient for the necessaries of life, Firdousí passed the later portion of his life in great privation, though enjoying the royal favor and widely extended fame. Amongst other princes whose liberal presents enabled him to combat his pecuniary difficulties, was one Rustem, son of Fakhr ed dauleh, the Deilamite, who sent him a thousand gold pieces in acknowledgment of a copy of the episode of Rustem and Isfendiar which Firdousí had sent him, and promised him a gracious reception if he should ever come to his court. As this prince belonged, like Firdousí, to the Shiah sect, while Mahmud and Meimendi were Sunnites, and as he was also politically opposed to the sultan, Hasan Meimendi did not fail to make the most of this incident, and accused the poet of disloyalty to his sovereign and patron, as well as of heresy. Other enemies and rivals also joined in the attack, and for some time Firdousí's position was very precarious, though his pre-eminent talents and obvious fitness for the work prevented him from losing his post. To add to his troubles he had the misfortune to lose his only son at the age of 37.

At length the book was completed, and Firdousí entrusted it to Ayáz, the sultan's favorite, for presentation to him. Mahmud ordered Hasan Meimendi to take the poet as much gold as an elephant could carry, but the jealous treasurer persuaded the monarch that it was too generous a reward, and that an elephant's load of silver would be sufficient. 60,000 silver dirhems were accordingly placed in sacks, and taken to Firdousí by Ayáz at the sultan's command, instead of the 60,000 gold pieces, one for each verse, which had been promised. The poet was at that moment in the bath, and seeing the sacks, and believing that they contained the expected gold, received them with great satisfaction, but finding only silver he complained to Ayáz that he had not executed the sultan's order. Ayáz related what had taken place between Mahmud and Hasan Meimendi, and Firdousí in a rage gave 20 thousand pieces to Ayáz himself, the same amount to the bath-keeper, and paid the rest to a beer seller for a glass of beer (*fouka*), sending word back to the sultan that it was not to gain money that he had taken so much trouble. On hearing this message, Mahmud at first reproached Hasan with having caused him to break his word, but the wily treasurer succeeded in turning his master's anger upon Firdousí to such an extent that he threatened that on the morrow he would "cast that Carmathian (heretic) under the feet of his elephants." Being apprised by one of the nobles of the court of what had taken place, Firdousí passed the night in great anxiety; but passing in the morning by the gate that led from his own apartments into the palace, he met the sultan in his private garden, and succeeded by humble apologies in appeasing his wrath. He was, however, far from being appeased himself, and determined at once upon quitting Ghaznin. Returning home he tore up the draughts of some thousands of verses which he had composed and threw them in the fire, and repairing to the grand mosque of Ghaznin he wrote upon the walls, at the place where the sultan was in the habit of praying, the following lines:—

"The auspicious court of Mahmud, king of Zabulistan, is like a sea. What a sea! One cannot see its shore. If I have dived therein without finding any pearls it is the fault of my star and not of the sea."

He then gave a sealed paper to Ayáz, begging him to hand it to the sultan in a leisure moment after 20 days had elapsed, and set off on his travels with no better equipment than his staff and a dervish's cloak. At the expiration of the 20 days Ayáz gave the paper to the sultan, who on opening it found the celebrated satire which is now always prefixed to copies of the *Shahnamah*, and which is perhaps one of the bitterest and severest pieces of reproach ever penned. Mahmud, in a violent rage, sent after the poet, and promised a large reward for his capture, but he was already in comparative safety. Firdousí directed his steps to Mazenderan, and took refuge with Kabous, prince of Jorján, who at first received him with great favor, and promised him his continued protection and patronage; learning, however, the circumstances under which he had left Ghaznin, he feared the resentment of so powerful a sovereign as Mahmud, who he knew already coveted his kingdom, and dismissed the poet with a magnificent present. Firdousí next repaired to Baghdad, where he made the acquaintance of a merchant, who introduced him to the vizier of the caliph, El Cader Billah, by presenting an Arabic poem which the poet had composed in his honor. The vizier gave Firdousí an apartment near himself, and related to the caliph the manner in which he had been treated at Ghaznin. The caliph summoned him into his presence, and was so much pleased with a poem of a thousand couplets, which Firdousí composed in his honor, that he at once received him into favor. The fact of his having devoted his life and talents to chronicling the renown of fire-worshipping Persians was, however, somewhat of a crime in the orthodox caliph's eyes; in order, therefore, to recover his prestige, Firdousí composed another poem, of 9000 couplets, on the theme borrowed from the Koran of the loves of Joseph and Potiphar's wife—*Yúsuf and Zuleikha*. This poem, though rare and little known, is still in existence—the Royal Asiatic Society possessing a copy. But Mahmud had by this time heard of his asylum at the court of the caliph, and wrote a letter menacing his liege lord, and demanding the surrender of the poet. Firdousí, to avoid further troubles, departed for Ahwaz, a province of the Persian Irak, and dedicated his *Yúsuf and Zuleikha* to the governor of that district. Thence he went to Kohistan, where the governor, Nasir Lek, was his intimate and devoted friend, and received him with great ceremony upon the frontier. Firdousí confided to him that he contemplated writing a bitter exposition of his shameful treatment at the hands of the sultan of Ghaznin; but Nasir Lek, who was a personal friend of the latter, dissuaded him from his purpose, but himself wrote and remonstrated with Mahmud. Nasir Lek's message and the urgent representations of Firdousí's friends had the desired effect; and Mahmud not only expressed his intention of offering full reparation to the poet, but put his enemy Meimendi to death. The change, however, came too late; Firdousí, now a broken and decrepit old man, had in the meanwhile returned to Tús, and, while wandering through the streets of his native town, heard a child lisping a verse from his own satire, in which he taunts Mahmud with his slavish birth:—

> "Had Mahmud's father been what he is now
> A crown of gold had decked this aged brow;
> Had Mahmud's mother been of gentle blood,
> In heaps of silver knee-deep had I stood."

He was so affected by this proof of universal sympathy with his misfortunes that he went home, fell sick, and died. He was buried in a garden, but Aboul Casim Gourgani, chief sheikh of Tús, refused to read the usual prayers over his tomb, alleging that he was an infidel, and had devoted his life to the glorification of fire-worshippers and misbelievers. The next night, however, having dreamt that he beheld Firdousí in paradise dressed in the sacred color, green, and wearing an emerald crown, he reconsidered his determination; and the poet was henceforth held to be perfectly orthodox. He died in the year 411 of the Hegira (1020 A.D.), aged about eighty, eleven years after the completion of his great work. Mahmud had in the meanwhile despatched the promised hundred thousand pieces of gold to Firdousí, with a robe of honor and ample apologies for the past. But as the camels bearing the treasure reached one of the gates of the city, Firdousí's funeral was leaving it by another. His daughter, to whom they brought the sultan's present, refused to receive it; but, his aged sister remembering his anxiety for the construction of the stone embankment for the river of Tús, this work was completed in honor of the poet's memory, and a large caravanserai built with the surplus.

---

[1] A sort of cuirass.

The *Shahnamah* is based, as we have seen, upon the ancient legends current among the populace of Persia, and collected by the Dihkans, a class of men who had the greatest facilities for this purpose. There is every reason to believe that Firdousí adhered faithfully to these records of antiquity, and that the poem is a perfect storehouse of the genuine traditions of the country. Among much that is marvellous or incongruous, therefore, we may fairly look for the records of real events; and there is no doubt that, studied by the light of modern criticism, the volume will prove of great service and interest to future historians and ethnologists.

The entire poem has been published with a French translation in a magnificent folio edition, at the expense of the French Government, by the late learned and indefatigable Jules de Mohl. The size and number of the volumes, however, and their great expense, make them difficult of access, while the original Persian, though easily procurable, is of course a sealed book to the majority of European readers. To supply this defect, Madame de Mohl has published in a cheap and convenient form the French translation, with her illustrious husband's critical notes and introduction. This will henceforth be the standard work on the subject, containing as it does a *résumé* of everything that has ever been written on the *Shahnamah*, or which can elucidate its contents. It is published at the "Imprimerie Nationale," Paris, under title of *Le Livre des Rois, par Abou'l Kasim Firdousí, traduit et commenté par Jules Mohl, Membre de l'Institut, Professeur au Collége de France; publié par Mme. Mohl*, Paris, 1876-7. (E. H. P.)

FIRE. So general is the knowledge of fire and its uses that it is a question whether we have any authentic instance on record of a tribe altogether ignorant of them. A few notices indeed are to be found in the voluminous literature of travel which would decide the question in the affirmative; but when they are carefully investigated, their evidence is found to be far from conclusive. The missionary Krapf was told by a slave of a tribe in the southern part of Shoa who lived like monkeys in the bamboo jungles, and were totally ignorant of fire; but no better authority has been found for the statement, and the story, which seems to be current in Eastern Africa, may be nothing else than the propagation of fables about the Pygmies whom the ancients located around the sources of the Nile. Commodore Wilkes, commander of the United States exploring expedition, says that in Fakaafo or Bowditch Island "there was no sign of places for cooking nor any appearance of fire," and that the natives felt evident alarm at the sparks produced by flint and steel and the smoke emitted by those with cigars in their mouths. The presence of the word *afi*, fire, in the Fakaafo vocabulary supplied by Hales the ethnographer of the expedition, though it might perhaps be explained as equivalent only to solar light and heat, undoubtedly invalidates the commodore's supposition; and the Rev. George Turner, in an account of a missionary voyage in 1859, not only repeats the word *afi* in his list for Fakaafo, but relates the native legend about the origin of fire, and describes some peculiar customs connected with its use. Alvaro de Saavedra, an old Spanish traveller, informs us that the inhabitants of Los Jardines, an island of the Pacific, showed great fear when they saw fire,—which they did not know before. But that island has not been identified with certainty by modern explorers. It belongs, perhaps, to the Ladrones or Marianas Archipelago, where fire was unknown, says Padre Gobien, "till Magellan, wroth at the pilferings of the inhabitants, burnt one of their villages. When they saw their wooden huts ablaze, their first thought was that fire was a beast which eats up wood. Some of them having approached the fire too near were burnt, and the others kept aloof, fearing to be torn or poisoned by the powerful breath of that terrible animal." To this Freycinet objects that these Ladrone islanders made pottery before the arrival of Europeans, that they had words expressing the ideas of flame, fire, oven, coals, roasting, and cooking. Let us add that in their country numerous graves and ruins have been found, which seem to be remnants of a former culture. Thus the question remains in uncertainty: though there is nothing impossible in the supposition of the existence of a fireless tribe, it cannot be said that such a tribe has been discovered.

It is useless to inquire in what way man first discovered that fire was subject to his control, and could even be called into being by appropriate means. With the natural phenomenon and its various aspects he must soon have become familiar. The volcano lit up the darkness of night and sent its ashes or its lava down into the plains; the lightning or the meteor struck the tree, and the forest was ablaze; or some less obvious cause produced some less extensive ignition. For a time it is possible that the grand manifestations of nature aroused no feelings save awe and terror; but man is quite as much endowed with curiosity as with reverence or caution, and familiarity must ere long have bred confidence if not contempt. It is by no means necessary to suppose that the practical discovery of fire was made only at one given spot and in one given way; it is much more probable indeed that different tribes and races obtained the knowledge in a variety of ways. We still find in different parts of the world the natives taking advantage of hot springs, naphtha or petroleum wells, and accessible craters. In the island of Tanna, for instance, there is a mountain to the west of Port Resolution which abounds in evidence of its volcanic character—in fissures, steam-jets, hot-springs, etc. The inhabitants, says the Rev. George Turner, have not the slightest apprehension of danger; their settlements are arranged so that their *murum* or public square occupies one of the "hot places of the mountain; and there they lounge and enjoy the subterranean heat. Some of the springs reach the boiling point. Every day women may be seen cooking vegetables in artificial pits which form a series of never failing boiling pots. In some places the men or boys have only to stand on the rocks, spear their fish, and pitch them behind into the hot springs." Similar accounts are given of the Maories in New Zealand, and the Negritos in the New Hebrides.

It has been asserted of many tribes that they would be unable to rekindle their fires if they were all allowed to die out. Travellers in Australia and Tasmania depict the typical native woman bearing always about with her a burning brand, which it is one of her principal duties to protect and foster; and it has been supposed that it was only ignorance which imposed on her the endless task. This, however, is not so certain; for Mr. Miklucho Maclay remarks of the Papuans, whom he has closely studied, that though they know how to produce fire, they prefer to carry it about. It was one of the distinguishing marks of the Samoan noble that his fire was never permitted to go out; and his attendants had a special name from their business of watching it while he slept. In Corea the preservation of the ancestral fire is still regarded as of the first importance for the happiness of a family, and the same belief has had a very extensive sway in other parts of the world.

The methods employed for producing fire vary considerably in detail, but are for the most part merely modified applications of concussion or friction. Sir John Lubbock has remarked that the working up of stone into implements must have been followed sooner or later by the discovery of fire; for in the process of chipping sparks were elicited, and in the process of polishing heat was generated. The first or concussion method is still familiar in the flint and steel, which has hardly passed out of use even in the most civilized countries. Its modifications are comparatively few and unimportant. The Alaskans and Aleutians take two pieces of quartz, rub them well with native sulphur, strike them together till the sulphur catches fire, and then transfer the flame to a heap of dry grass over which a few feathers have been scattered. Instead of two pieces of quartz the Eskimos use a piece of quartz and a piece of iron pyrites. Mr. Frederick Boyle saw fire produced by striking broken china violently against a bamboo, and Bastian observed the same process in Burmah, and Wallace in Ternate. In Cochin China two pieces of bamboo are considered sufficient, the silicious character of the outside layer rendering it as good as native flint. The friction methods are more various. One of the simplest is what Mr. Tylor calls the stick and groove—"a blunt pointed stick being run along a groove of its own making in a piece of wood lying on the ground." Much, of course, depends on the quality of the woods and the expertness of the manipulator. In Tahiti Mr. Darwin saw a native produce fire in a few seconds, but only succeeded himself after much labor. The same device was employed in New Zealand, the Sandwich Islands, Tonga, Samoa, and the Radack islands. Instead of rubbing the movable stick backwards and forwards other tribes make it rotate rapidly in a round hole in the stationary piece of wood—thus making what Mr. Tylor has happily designated a fire-drill. This device has been observed in Australia, Kamchatka, Sumatra, and the Carolines, among the Veddahs of Ceylon, throughout a great part of Southern Africa, among the Eskimo and Indian tribes of North America, in the West Indies, in Central America, and as far south as the Straits of Magellan. It was also employed by the ancient Mexicans, and Mr. Tylor gives a quaint picture of the operation from a Mexican MS.,—a man half kneeling on the ground is causing the stick to rotate between the palms of his hands. This simple method of rotation seems to be very generally in use; but various devices have been resorted to for the purpose of diminishing the labor and hastening the result. The Gaucho of the Pampas takes "an elastic stick about 18 inches long, presses one end to his breast and the other in a hole in a piece of wood, and then rapidly turns the curved part like a carpenter's centre-bit." In other cases the rotation is effected by means of a cord or thong wound round the drill and pulled alternately by this end and that. In order to steady the drill the Eskimo and others put the upper end in a socket of ivory or bone which they hold firmly in their mouth. A further advance was made by some of the North American Indians, who appear to have applied the principle of the bow-drill; and the still more ingenious pump-drill was used by the Iroquois Indians. For full descriptions of these instruments and a rich variety of details connected with fire-making we must refer the reader to Mr. Tylor's valuable chapter in his *Researches.* These methods of producing fire are but rarely used in Europe, and only in connection with superstitious observances. We read in Wuttke that some time ago the authorities of a Mecklenburg village ordered a "wild fire" to be lit against a murrain amongst the cattle. For two hours the men strove vainly to obtain a spark, but the fault was not to be ascribed to the quality of the wood, or to the dampness of the atmosphere, but to the stubbornnesss of an old lady, who, objecting to the superstition, would not put out her night lamp; such a fire, to be efficient, must burn alone. At last the strong-minded female was compelled to give in; fire was obtained,—but of bad quality, for it did not stop the murrain.

It has long been known that the rays of the sun might be concentrated by a lens or concave mirror. Aristophanes mentions the burning-lens in *The Clouds*, and the story of Archimedes using a mirror to fire the ships at Syracuse is familiar to every schoolboy. If Garcilasso de la Vega can be trusted as an authority, the Virgins of the Sun in Peru kindled the sacred fire with a concave cup set in a great bracelet. In China the burning-glass is in common use.

To the inquiry how mankind became possessed of fire, the cosmogonies, those records of pristine speculative thought, do not give any reply which would not be found in the relations of travellers and historians.

They say in the Tonga Islands that the god of the earthquakes is likewise the god of fire. At Mangaïa it is told that the great Maui went down to hell, where he surprised the secret of making fire by rubbing two pieces of wood together. The Maories tell the tale differently. Maui had the fire given to him by his old blind grandmother, Mahuika, who drew it from the nails of her hands. Wishing to have a stronger one, he pretended that it had gone out, and so he obtained fire from her great toe. It was so fierce that everything melted before the glow; even Maui and the grandmother herself were already burning when a deluge, sent from heaven, saved the hero and the perishing world; but before the waters extinguished all the blaze, Mahuika shut a few sparks into some trees, and thence men draw it now. The Maories have also the legend that thunder is the noise of Tawhaki's footsteps, and that lightnings flash from his armpits. At Western Point, Victoria, the Australians say the good old man Pundyil opened the door of the sun, whose light poured then on earth, and that Karakorok, the good man's good daughter, seeing the earth to be full of serpents, went everywhere destroying serpents; but before she had killed them all, her staff snapped in two, and while it broke, a flame burst out of it. Here the serpent-killer is a fire-bringer. In the Persian *Shahnamah* also fire was discovered by a dragon-fighter. Hushenk, the powerful hero, hurled at the monster a prodigious stone, which, evaded by the snake, struck a rock and was splintered by it. "Light shone from the dark pebble, the heart of the rock flashed out in glory, and fire was seen for the first time in the world." The snake escaped, but the mystery of fire had been revealed.

North American legends narrate how the great buffalo, careering through the plains, makes sparks flit in the night, and sets the prairie ablaze by his hoofs hitting the rocks. We meet the same idea in the Hindu mythology, which conceives thunder to have been, among many other things, the clatter of the solar horses on the Akmon or hard pavement of the sky. The Dakotas claim that their ancestor obtained fire from the sparks which a friendly panther struck with its claws, as it scampered upon a stony hill. Tohil, who gave the Quiches fire by shaking his sandals, was, like the Mexican Quetzelcoatl, represented by a flint stone. Guamansuri, the father of the Peruvians, produced the thunder and the lightning by hurling stones with his sling. The thunderbolts are his children. Kudai, the great god of the Altaian Tartars, disclosed "the secret of the stone's edge and the iron's hardness." The Slavonian god of thunder was depicted with a silex in his hand, or even protruding from his head. The Lapp Tiermes struck with his hammer upon his own head; the Scandinavian Thor held a mallet in one hand, a flint in the other. Taranis, the Gaul, had upon his head a huge mace surrounded by six little ones. Finnish poems describe how "fire, the child of the sun, came down from heaven, where it was rocked in a tub of yellow copper, in a large pail of gold." Ukko, the Esthonian god, sends forth lightnings, as he strikes his stone with his steel. According to the Kalewala, the same mighty Ukko struck his sword against his nail, and from the nail issued the "fiery babe." He gave it to the Wind's daughter to rock it, but the unwary maiden let it fall in the sea, where it was swallowed by the great pike, and fire would have been lost for ever, if the child of the sun had not come to the rescue. He dragged the great pike from the water, drew out his entrails, and found there the heavenly spark still alive. Hephæstus also, the Greek fire-god, fell from heaven into the sea of Lemnos. Prometheus brought to earth the torch he had lighted at the sun's chariot.

Human culture may be said to have begun with fire, of which the uses increased in the same ratio as culture itself. To save the labor expended on the initial process of procuring light, or on carrying it about constantly, primitive men hit on the expedient of a fire which should burn night and day in a public building. The Egyptians had one in every temple, the Greeks, Latins, and Persians in all towns and villages. The Natchez, the Mexicans, the Mayas, the Peruvians, had their "national fires" burning upon large pyramids. Of these fires the "eternal lamps" in the synagogues, in the Byzantine and Catholic churches, may be a survival. The "Regia," Rome's sacred centre, supposed to be the abode of Vesta, stood close to a fountain; it was convenient to draw from the same spot the two great requisites, fire and water. All civil and political interests grouped themselves around the Prytaneion, which was at once a temple, a tribunal, a town-hall, and a gossiping resort; all public business and most private affairs were transacted by the light and in the warmth of the common fire. No wonder that its flagstones should become sacred. Primitive communities consider as holy everything that ensures their existence and promotes their welfare, material things such as fire and water not less than others. Thus the Prytaneion grew into a religious institution. And if we hear a little more of fire worship than of water worship, it is because fire, being on the whole more difficult to obtain, was esteemed more precious.

We have curious and concordant testimonies that the principal functions of the state itself grew out of the care which was bestowed on the tribal fire. The men who attended it in Hellas were called the Prytanes. They had to eat together, and it would have been considered as a bad omen if they had neglected that duty. They were fed at the public expense; and well they might be, for having been, probably, general cooks at the outset, they became, when the city was established, *Archontes* or magistrates, and even *Basileis*, or a combination of the captain, the priest, and the king. Thus the first guardians of the tribal fire were the earliest public servants, who by degrees appropriated all important offices, as the state itself developed into a vast aggregation of interests. And when Augustus usurped the Roman empire, he assumed all the powers which a pristine board of flamens, or of Prytanes, may have possessed. He made himself *Pontifex Maximus*, and assumed the charge of the public fire; and on transporting it to his own palace, he had to convert it into public property. The Hellenic nations, as well as the Aztecs, received ambassadors in their temples of fire, where, as at the national hearth, they feasted the foreign guests. The Prytaneion and the state were convertible terms. If by chance the fire in the Roman temple of Vesta was extinguished, all tribunals, all authority, all public or private business, had to stop immediately. The connection between heaven and earth had been broken, and it had to be restored in some way or other,—either by Jove sending down divine lightning on his altars, or by the priests making a new fire by the old sacred method of rubbing two pieces of wood together, or by catching the rays of the sun in a concave mirror. No Greek or Roman army crossed the frontier without carrying an altar where the fire taken from the Prytaneion burned night and day. When the Greeks sent out colonies the emigrants took with them living coals from the altar of Hestia, and had in their new country a fire lit as a representative of that burning in the mother country.[1] Not before the three curiæ united their fires into one could Rome become powerful; and Athens became a shining light to the world only, we are told, when the twelve tribes of Attica, led by Theseus, brought each its brand to the altar of Athene Polias. All Greece confederated, making Delphi its central hearth; and the islands congregated around Delos, whence the new fire was fetched every year.

According to a not impossible theory, all architecture, public and private, sacred and profane, began with the erection of sacred sheds to protect the sacred fire, which abodes men dared to inhabit only after a length of time. For it must be borne in mind that fire was looked upon as a divinity. We are expressly told that Vesta had no image or statue even in her own temple, the Vestal fire being considered as the very goddess herself. The husbandmen who ate their repast before the hearth believed, as Ovid relates, that they sat in the presence of the gods themselves. The hearth fire was kept holy, its flame was to remain bright and pure. The minute and irksome prescriptions of the Zend-Avesta carried this feeling to the extreme: it was and it is still a widely spread belief that nothing unclean is to be thrown in the fire, that no indecent actions are to be committed before it. To spit in one's fire would be now considered in many places, in Albania, for example, as an unpardonable offence. The Galtchas of Ferghana, according to M. de Ujfalvy, are so reverential that they would not blow out a light lest they should render the flame impure with their breath; and a similar peculiarity was observed by Wood in Badakshan and by Khanikoff among the Tadjiks of Bokhara.[2]

In the course of time, the same reasons which made the tribe provide itself with a permanent fire made every family have its hearth. It would even be more accurate to say that the family, as it is called now-a-days, developed itself after the human couple and their children had their own fire-place, and not before. It is likely that at the outset only the higher aristocracy of chieftains, *eumetrides* or *eupatrides*, were allowed to have a fire of their own, which was then equivalent to a private or family god. They kept it burning night and day all the year round. As recently as the last generation, fires of such a character were rather numerous in the northern countries.[3]

These lingering customs take us back to the time when every hearth was an altar. From the national Prytaneion a brand was given to each gens. When gentes grew out of the tribe, and subsequently when families grew out of the gentes, coals from the gentile sacrificial stone were given to every family. These three social organisms, the nation, the gens, the family, one merging into another, had fire for their common symbol, and esteemed it as even the cause of their existence. The hearth was the very centre of the house, as the regia was the sacred centre of Rome and the Roman commonwealth; around the regia the civic and politic institutions developed themselves, and around the hearth the family grew slowly into shape and power.

As already observed, the Prytaneion was an altar to the genius of the commonwealth, the abode of the nation's heroic ancestors. Its exact counterpart was the gentile hearth, owned by the gens at large and its dependent families. When the gentes broke asunder, every family became possessed likewise of an altar to its particular "Penates" and "Lares," or sacred fathers. These fathers were not mere ancestors, or grandparents, as we hold them now to be, but the constant progenitors; not only were they believed to have begotten children in a former age, but also to go on begetting them constantly through succeeding generations. Procreators and protectors as well, they were the source of blessing at the same time as the source of existence. Called gods, "*theoi patrooi, genethlioi, engeneis, sunaimoi,*" they were in fact the gods of the household, but gods of the same kin and blood as their descendants. No oath was held more sacred than the one which a man swore by his own hearth,—no prayer more readily granted than that which was coupled with a wish for the welfare of the hearth. The hearth had a recognized right of asylum, which is yet in full vigor in many countries. But it was above all the throne of the "paterfamilias," the stronghold of his dominion. The proud saying of the Englishman that his home is his castle is but an attenuated remnant of the feeling which animated the chiefs of the Vedic, the Greek, and the Italian gentes. Such a man was the king absolute over his household; he wielded the power of life and death over all his subordinates, cattle, slaves, children, wife or wives; he was the priest of his altar, the manager and expounder of all divine things, elevated above the standard of common mortals. He alone in his kingdom could, if need were, make a new fire, not with a vulgar flint and iron, but by the solemn mode of rubbing together two sacred twigs. In this way all Greek hearths were provided with new fires when the ancient ones had been sullied by the look of the hated Persian invaders. Beside the hearth, the second place, at least, was due to the wife and mother; and as time went on her influence continued to increase.[4]

Identity of Fire and Soul in Ancient Belief.—The sun, as the source of heat, gives life to earth; and it was natural to suppose that the hearth, "the sun in the house," as the younger Edda calls it, radiated life likewise. Therefore it was made the seat of the Lares and Penates, or ancestors, a dwelling-place for the deceased, where a stock of souls ready to enter existence by new births was maintained. The famous Roman legend of Servius Tullius, whom Plutarch and other writers report to have been procreated in the ashes of the hearth by the Lares themselves, is a curious illustration of this belief. A sepulchral picture at Orvieto represents a double phallus protruding from the flame of a hearth, on which a libation is being poured. The Vedas taught that the hearth-fire was cosubstantial with the cause of generation. Hence care was taken to preserve the purity of descent in the kin by preserving the flame of the hearth pure and unmingled with fire taken from another house. On this matter the ancient Persians were particularly punctilious, feeding their fires, and especially their sacred fires, only with certain kinds of wood, reputed to be cleaner than all others, well dried, and well stript of the bark. Everywhere and in all countries, it was considered a most fatal omen if the fire died out in the hearth. The family whose fire went out had incurred the ire of the Lares, who, if not quickly appeased, would strike the sons with impotence and imbecility. A new fire was to be lit by the friction of two twigs, as to fetch some from a neighbor's would have been considered an adulterous union of hearths, an undue mingling of two families' blood.[1]

---

[1] Curiously enough, we see the same institution obtaining among the Damaras of South Africa, where the chiefs, who sway their people with a sort of priestly authority, commit to their daughters the care of a so-called eternal fire. From its hearth younger scions separating from the parent stock take away a burning brand to their new home. The use of a common Prytaneion, of circular form, like the Roman temple of Vesta, testified to the common origin of the North American Assinais and Maichas. The Mobiles, the Chippeways, the Natchez, had each a corporation of Vestals. If the Natchez let their fire die out, they were bound to renew it from the Mobiles. The Moquis, Pueblos, and Comanches had also their perpetual fires. The Red-skins discussed important affairs of state at the "council fires," around which each *sachem* marched three times, turning to it all the sides of his person. "It was a saying among our ancestors," said an Iroquois chief in 1753, "that when the fire goes out at Onondoga"—the Delphi of the league—"we shall no longer be a people."

[2] See *Bulletin de la Soc. de Géog.*, Paris, 1878, p. 489; Wood's *Journey to Source of Oxus*, 1872, p. 177.

[3] The rich Westphalian farmers have still between their habitation and the stables the so-called *Skorestein*, where burns a constant fire, for which they have a superstitious regard. On the banks of the Sieg it was the custom, as recently as the year 1855, to insert a large mass of oak, usually a stump with its roots, in a niche opposite the pot-hanger. The block smouldered slowly, and was intended to last the whole year, from Christmas to Christmas, when its remains were ground to powder and strewn on the fields to insure their fertility.

[4] The traveller Pallas was told by the Mongol populations which he visited that a woman might indulge in the vilest abuse and insult, and no one would dare to touch her, so long as she stood between the bed and the fire-place. In the Vedas we see that the new wife underwent some sort of consecration by walking thrice around the new hearth-place, and stretching her hand into the flames while she was being sprinkled over with lustral water. In Germany and Slav countries, the bride, as she comes from church and enters her new house, bows to the fire burning on the hearth, walks thrice round it, burns three of her hairs, and binds a red string round her body. What is no more done by the mistress is still done to her servants in Germany, who, as they come in, are made to run round the kitchen fire, are touched with soot, and have their bare feet sprinkled with ashes.

Resemblance between Fire-Production and Life-Production.—For a long time, throughout all the world, the ancient naturalists who meditated on the greatest wonder of physiology, supposed that the generation of fire by the friction of two woods, one of harder, the other of softer substance, was the exact counterpart of human generation. The heat thus evolved in the human organism was held to be of most subtle nature, a flash of the astral light, an intelligent substance. Primary fire impregnated primary water, and the soul was born. Life was compared to a flame, to a torch; and no comparison is more true. Modern chemistry having proved that animal life is a constant burning of oxygen, the ancient myth was not far from the truth when it said that Prometheus animated the figure of clay by putting into it a spark of fire. "Know ye," said an Ojibway prophet, "that the fire in your huts and the life in your bodies are one and the same thing." A torch which was put out by throwing it violently on the ground symbolized in ecclesiastical rites excommunication, or the condemnation of a soul to eternal death. In classical mythology, Meleager's life was bound to a log of wood; when the one was turned to a heap of ashes, the other was to fall dead. "*Corpus est terra, anima est ignis,*" that old piece of philosophy, became inseparable from poetry and language; and now, as in the days of yore, the soul and the "genius" are always spoken of as if they possessed the nature of flame, and the angels and the peris as if their substances were pure light. According to the pristine physiology, man was likewise a fire, but a fire hidden in clay, diluted in water. If it had not been for water, the flame would have been destroyed by its own force,—it would have blazed up, coruscating violently in dazzling effulgence, and then dying out. In fact, all primitive theories attributed to gaseous water the action which our present science attributes to nitrogen, without which oxidation would go on too rapidly to allow of the formation of oxidizable matter. Hence water was thought to be as necessary as fire itself; hence ancient law forbade the individuals guilty of offences against the commonwealth to have fire and water given them—a sentence equivalent to death. The mixture of organic fire and organic water in our bodies was compared to that in vegetable matter, which emits much smoke if burned when in green or wet condition. Nay, by pursuing the analysis of combustion in which the classical world had centred all its philosophy, the ashes or mineral detritus which fell on the hearth found their analogue in the flesh, in the bones, in the solid parts of our organism. Thus man was thought to be an alloy of fire, earth, and water in slightly different proportions. Fire, a constituent part of the divine intelligence, became a soul when it was immersed in organic water; it became the body when it was put into organic clay. The traditions of the Egyptian priesthood, which were current under the name of Hermes Trismegistus, teach that at the moment of death, "our intelligence, one of God's subtile thoughts, escapes the body's cross, puts on its fiery tunic again, and floats henceforth in space," leaving the soul to await judgment. Men were divided into noble and ignoble, according as the material or the spiritual side of their nature predominated. Thus a frequent distinction in the burials, which may have arisen even in prehistoric times, can be explained. Chiefs and kings, priests and noblemen, possessed all of a divine soul, were burned, flame going forth to flame; but people of the common sort were sunk among the sods, clay going back to clay.[2]

Cosmic Fire.—The opinions and beliefs which most primitive populations have entertained on the nature of fire in the hearth were applied by them to the great cosmic fire: both were life-givers, one to the family and the other to the universe; both were parts of the same substance or element. It was taught by Aristotle that Zeus was a name given to the fire of heaven, and by Plato and Euripides that the same Hestia burned in the humblest hut and the highest sky. Ovid went so far as to identify that goddess with the earth itself. According to that doctrine fire was held to be the very soul of nature, the essence of everything that had a shape, and even to be the giver of that shape, for philosophers explained that of all elements none but fire having any form by itself could impart it to other things. From Jupiter to the fly, from the wandering star to the tiniest blade of grass, all beings owed existence to the fiery element. This theory, more or less distinctly expressed, obtained among the Aztecs, who invoked in their prayers "fire the most ancient divinity, the father and mother of all gods." Tohil the Quiche, Quetzacoatl the Mexican, Tiermes the Finn, Perkun the Slav, Thor the Scandinavian, Taranis the Gaul, and many other gods, as stated above, were represented as having firestones for heads or for bodies; one of them was said to have flashed up in lightnings as he was dragged along the rocky heavens by some powerful antagonist. Such a god, encased in a shell of flint, fell down from heaven upon earth, according to an Indian legend; the shell broke into sixteen hundred fragments, and each of them arose and stood up as a particular god. From such a thunderbolt or meteorite the Dacotas boasted to have originated.

In the Gnostic theory the middle part of the cosmos was taken up by the starry world, emitting the astral light, inferior in sanctity to the mild effulgence of ether above it, but superior in vivifying properties to our common fires. These three conditions of the cosmic fire corresponded to the three component parts of man—mind, soul, and body. Prophets and other great and pious men had minds still refulgent with ethereal rays, which were the thoughts of divinity: while the wicked had souls which had been soaked in a smoky fire, and in stupid people there glimmered but the weakest possible ray of celestial light.

It was not the hottest fire which was supposed to be the most divine. Fierce heat being inimical to organic life, hot fires are said to be hellish ones. Their masters, the demons of drought and sterility, dry up the fountains, scorch the grass, excite pestilence, are the worst fiends to the human race. Pure light was thought to be without any heat at all, and legends tell of "theophanias," of aureoles, of fiery tongues flickering above the cradles of infants predestined to glorious careers. Phallic fire, giving out heat but no light, was often considered as of an inferior nature, and therefore represented by secondary or even by tertiary deities, fauns, satyrs, ægipans, and the like.

At the outset the gods and demons alike had some command of fire, but they were distinguishable by the nature of their fire. Among the Scandanavians, Woden was the fire that shines, Thor the lightning, and Loki the fire that burns and shall one day destroy the whole world; Brahma, Indra, Siwa, and Osiris, Horus, Typhon, had similar meanings. Zeus, Apollo, and Athene presided over the celestial flame; Hercules and Dionysus marked the progressive purifications of the terrestrial fire. Besides his influence over generation, Hephæstus had the command of the subterranean fire and of its vast smithies, where earths and stones were fused into metals. It was with a feeling of the most intense awe that the Vedic Aryans contemplated the thunderstorm and the lightning, the fierce struggle in the heavens, the fight between the winds and the clouds, between fire and water, between the fire-god Indra and Vritra the fire-dragon. So, likewise, the Iranians conceived of our world as the field of the great battle between Ormuzd the Increaser, and his twin brother Ahriman the Destroyer.

Healing and Purification by Fire.—The principle of life being a fiery one, it was supposed that all maladies were only so many defilements of the pure principle which had been darkened by the demons of night, and that all sick people were demoniacs. The traditions of the Finns assert that lightning, the fiery sword of Ukko, slays the demons of illness. But it was discovered that the exhibition of lightning, as a healing method, was attended with grave drawbacks: it was impossible to insure being able to use it, and when it could be obtained, the cure was worse than the disease, as the patient was killed before the imp who had bedeviled him. It became necessary to have recourse to a substitute; and therefore the healing virtues of the thunderbolt were embodied in the *Keraunia* or thunderstones. The "holy stones" of the Anglo-Saxons, or "holed stones," arrow heads, flint celts, and flint knives worked by prehistoric men, were popularly believed to be stones which falling down from heaven possessed heavenly virtues, and were of use in all sorts of disease.[1]

---

[1] It is interesting to note that in Bohemia the country people have still a strong prejudice against any fire being taken to or taken from the hearth. Till the babe be forty days old, the Albanians do not allow a brand, not even a coal, from the family fire-place to be given away. As long as the Japanese had castes, people of the higher ranks ate no food except what was cooked in their own home, for fear of "mixing fire," evidently because they thought that fire imparted its nature to food, and by means of food to the bodily powers.

[2] So among Algonquins and Ottaways those only of the "Great Hare totem," among the Nicaraguans none but the "caciques," among the Caribs no others than the priestly caste, were entitled to the honor of cremation. The tribes of Upper California were even persuaded that such as were not burned were liable to be transformed into brutes. Among certain populations (as, for instance, the Colchians of old, and the Babeens or Chimpseyans of our times) the males had the privilege of the pyre, which was denied to women. The examples illustrating the belief of the soul being a fire are so numerous that it is difficult to choose among them. In Voigtland the souls of unchristened babes are believed to be turned into Wills-of-the-Wisp. The souls of dying men or beasts are said to burn sometimes with a heat so intense that their eyes inflame piles of wood. It is a frequent feat of divine horses in Tartar legends to make the rocks glow and melt as pitch by merely looking at them.

Sickness having become identified with sin, purification became the first and most esteemed of curative agents and of prophylactics. It needed to be undergone when a dead body had been touched or when women had been delivered. The mother walked with her babe through fires lit on her right hand and on her left; the infants, especially the males, were fumigated with great care. Among some populations none could approach mother and child without stepping over a brazier. Fiery ordeals heralded the attainment of the age of puberty by both sexes. Ambassadors were refused admittance to the presence of the sovereign until they had traversed a flame which should singe away the foreign devilries which they might carry about them.

Purification by fire led to the institution of baptism by fire, which in many places was thought vastly superior to baptism by water; and the idea obtained its furthest development in the notion of purgatorial fires, which is not peculiar to one church. Often people had misgivings about the penance which awaited them in a future state, and reckoned that it would be better for them to undergo it on this side of the grave.[2]

Periodic Fires.—Because the sun loses its force after noon, and after midsummer daily shortens the length of its circuit, the ancients inferred, and primitive populations still believe, that, as time goes on, the energies of fire must necessarily decline. Therefore men set about renewing the fires in the temples and on the hearth, on the longest day of summer or at the beginning of the agricultural year. The ceremony was attended with much rejoicing, banqueting, and many religious rites. Houses were thoroughly cleansed; people bathed, and underwent lustrations and purifications; new clothes were put on; quarrels were made up; debts were paid by the debtor or remitted by the creditor; criminals were released by the civil authorities in imitation of the heavenly judges, who were believed to grant on the same day a general remission of sins. All things were made new; each man turned over a new page in the book of his existence. Some nations, like the Etruscans in the Old World, and the Peruvians and Mexicans in the New, carried these ideas to a high degree of development, and celebrated with magnificent ceremonies the renewal of the *sæcula*, or astronomic periods, which might be shorter or longer than a century. Some details of the festival among the Aztecs have been preserved. On the last night of every period (52 years) every fire was extinguished, and men proceeded in solemn procession to some sacred spot, where, with awe and trembling, the priests strove to kindle a new fire by friction. It was as if they had a vague idea that the cosmos, with its sun, moon, and stars, had been wound up like a clock for a definite period of time. And had they failed to raise the vital spark, they would have believed that it was because the great fire was being extinguished at the central hearth of the world. The Stoics and many other ancient philosophers thought that the world was doomed to final extinction by fire. The Scandinavian bards sung the end of the world, how at last the wolf Fenrir would get loose, how the cruel fire of Loki would destroy itself by destroying everything. The Essenes enlarged upon this doctrine, which is also found in the Sibylline books and appears in the Apocrypha (2 Esdras xvi. 15).

(E. RE.)

FIRE is considered in the present article in relation to the destruction by it of life and property. History is full of accounts of the devastation it has caused in the towns and cities of nearly every country of the civilized world. The following list embraces the most memorable of the great fires of which records have been preserved:—

GREAT BRITAIN AND IRELAND.

798. *London*, nearly destroyed.
982. “ greater part of the city burned.
1086. “ all houses and churches from the east to the west gate burned.
1212. “ greater part of the city burned.
1666. “ "The Great Fire," September 2–6.

It began in a wooden house in Pudding Lane, and burned for three days, consuming the buildings on 436 acres, 400 streets, lanes, etc., 13,200 houses, with St. Paul's church, 86 parish churches, 6 chapels, the guild-hall, the royal exchange, the custom-house, many hospitals and libraries, 52 companies' halls, and a vast number of other stately edifices, together with three of the city gates, four stone bridges, and the prisons of Newgate, the Fleet, and the Poultry and Wood Street Compters. The fire swept from the Tower to Temple church, and from the N. E. gate to Holborn bridge. Six persons were killed. The total loss of property was estimated at the time to be £10,730,500.

1794. *London*, 630 houses destroyed at Wapping. Loss above £1,000,000.
1834. “ Houses of Parliament burned.
1861. “ Tooley Street wharves, etc., burned. Loss estimated at £2,000,000.
1873. “ Alexandra palace destroyed.
1137. *York*, totally destroyed.
1184. *Glastonbury*, town and abbey burned.
1292. *Carlisle*, destroyed.
1507. *Norwich*, nearly destroyed; 718 houses burned.
1544. *Leith*, burned.
1598. *Tiverton*, 400 houses and a large number of horses burned; 33 persons killed. Loss, £150,000.
1612. “ 600 houses burned. Loss over £200,000.
1731. “ 300 houses burned.
1700. *Edinburgh*, "the Great Fire." —
1612. *Cork*, greater part burned, and again in 1622.
1613. *Dorchester*, nearly destroyed. Loss, £200,000.
1614. *Stratford-on-Avon*, burned.
1644. *Beaminster*, burned. Again in 1684 and 1781.
1675. *Northampton*, almost totally destroyed.
1683. *Newmarket*, large part of the town burned.
1694. *Warwick*, more than half burned; rebuilt by national contribution.
1707. *Lisburn*, burned.
1727. *Gravesend*, destroyed.
1738. *Wellingborough*, 800 houses burned.
1743. *Crediton*, 450 houses destroyed.
1760. *Portsmouth*, dockyard burned. Loss, £400,000.
1770. “ “ “ Loss, £100,000.
1802. *Liverpool*, destructive fire. Loss, £1,000,000.
1827. *Sheerness*, 50 houses and much property destroyed.
1854. *Gateshead*, 50 persons killed. Loss, £1,000,000.
1875. *Glasgow*. Great fire. Loss, £300,000.

FRANCE.

59. *Lyons*, burned to ashes. Nero offers to rebuild it.
1118. *Nantes*, greater part of the city destroyed.
1137. *Dijon*, burned.
1524. *Troyes*, nearly destroyed.
1720. *Rennes*, on fire from December 22 to 29, 850 houses burned.
1784. *Brest*. Fire and explosion in dockyard. Loss, £1,000,000.
1862. *Marseilles*, destructive fire.
1871. *Paris*. Communist devastations. Property destroyed, £32,000,000.

---

[1] In mild cases the Australian sorcerer applies fire to the injured parts of his patients. The Persians kindle fire on the terraces of their house where the sick man lies. The Patagonians fire off guns and revolvers, and throw burning brands into the air. In Turkestan, sick children are made to leap over burning fires, and are struck seven times on the back. At every stroke remonstrances are addressed to the demon, such as "Begone to the sea! Begone to the desert!" Similar practices are still resorted to in mountainous regions of France when illness smites the flocks. In backward districts of Germany, when the swine sicken and die, the "wild fire," or "*Nothfeuer*," is kindled, but it would have no virtue if it were kindled by bachelors instead of by married men, or with matches and not by the orthodox process of rubbing wood against wood.

[2] In the hill ranges of Southern India penitents are made to pass through a row of burning huts, and are absolved after having passed the seventh. Before seed is sown it is still passed through the fire in Bavaria; and in Basuto-land children underwent recently a similar process, being held over the flame of a lighted altar. The earth was freed from the demons of sterility by lighting huge fires, and the fields became fertile as far as the blaze could be seen distinctly,—a practice which still prevails in many places from Norway to Central America.

Central and Southern Europe.

64. *Rome* burned during 8 days. 10 of the 14 wards of the city were destroyed.
1106. *Venice*, greater part of the city was burned.
1577. " fire at the arsenal, greater part of the city ruined by an explosion.
1299. *Weimar*, destructive fire; also in 1424 and 1618.
1379. *Memel* was in large part destroyed, and again in 1457, 1540, 1678, 1854.
1405. *Bern* was destroyed.
1420. *Leipsic* lost 400 houses.
1457. *Dort*, cathedral and large part of the town burned.
1491. *Dresden* was destroyed.
1521. *Oviedo*, large part of the city destroyed.
1543. *Komorn* was burned.
1634. *Fürth* was burned by Austrian Croats.
1680. " was again destroyed.
1686. *Landau* was almost destroyed.
1758. *Pirna* was burned by Prussians. 260 houses destroyed.
1762. *Munich* lost 200 houses.
1764. *Königsberg*, public buildings, etc., burned. Loss, £600,000.
1769. " almost destroyed.
1784. *Rokitzan* (Bohemia) was totally destroyed. Loss, £300,000.
1801. *Brody*, 1500 houses destroyed.
1859. " 1000 houses destroyed.
1803. *Posen*, large part of older portion of city burned.
1811. Forest fires in Tyrol destroyed 64 villages and hamlets.
1818. *Salzburg* was partly destroyed.
1842. *Hamburg*. A fire raged for 100 hours, May 5–7.

> During the fire the city was in a state of anarchy. 4219 buildings, including 2000 dwellings, were destroyed. One-fifth of the population was made homeless, and 100 persons lost their lives. The total loss amounted to £7,000,000. After the fire contributions from all Germany came in to help to rebuild the city.

1861. *Glarus* (Switzerland), 590 houses burned.

Northern Europe.

1530. *Aalborg*, almost entirely destroyed.
1541. *Aarhuus*, almost entirely destroyed, and again in 1556.
1624. *Opslo*, nearly destroyed. Christiania was built on the site.
1702. *Bergen*, greater part of the town destroyed.
1728. *Copenhagen*, nearly destroyed. 1650 houses burned, 77 streets.
1794. " royal palace with contents burned.
1795. " 50 streets, 1563 houses burned.
1751. *Stockholm*, 1000 houses destroyed.
1759. " 250 houses burned. Loss, 2,000,000 crowns.
1775. *Abo*, 200 houses and 15 mills burned.
1827. " 780 houses burned, with the university.
1790. *Carlscrona*, 1087 houses, churches, warehouses, etc., destroyed.
1802. *Gothenburg*, 178 houses burned.
1858. *Christiania*. Loss estimated at £250,000.
1865. *Carlstadt* (Sweden), everything burned except the bishop's residence, hospital, and jail. 10 lives lost.

Russia.

1736. *St. Petersburg*, 2000 houses burned.
1862. " great fire. Loss, £1,000,000.
1752. *Moscow*, 18,000 houses burned.
1812. " The Russians fired the city on September 14 to drive out the army of Napoleon. The fire continued five days. Nine-tenths of the city was destroyed. Number of houses burned, 30,800. Loss, £30,000,000.
1753. *Archangel*, 900 houses burned.
1793. " 3000 buildings and the cathedral burned.
1786. *Tobolsk*, nearly destroyed.
1788. *Mitau*, nearly destroyed.
1812. *Riga*, partly destroyed.
1834. *Tula*, destructive fire.
1848. *Orel*, large part of the town destroyed.
1850. *Cracow*, large part of the town burned.
1864. *Novgorod*, large amount of property destroyed.

Turkey.

The following fires have occurred at *Constantinople* :—

1729. A great fire destroyed 12,000 houses and 7000 people.
1745. A fire lasted five days.
1750. In January 10,000 houses burned: in April property destroyed estimated from £1,000,000 to £3,000,000. Later in the year 10,000 houses were destroyed.
1751. 4000 houses were burned.
1756. 15,000 houses and 100 people destroyed. During the years 1761, 1765, and 1767 great havoc was made by fire.
1769. July 17. A fire raged for twelve hours, extending nearly 1 mile in length. Many of the palaces, some small mosques, and nearly 650 houses were destroyed.
1771. A fire lasting 15 hours consumed 2500 houses and shops.
1778. 2000 houses were burned.
1782. August 12. A fire burned three days: 10,000 houses, 50 mosques, and 100 corn mills destroyed; 100 lives lost. In February 600 houses burned; in June 7000 more.
1784. August 5. A fire burned for 26 hours, and destroyed 10,000 houses, most of which had been rebuilt since the fires of 1782. In the same year, March 13, a fire in the suburb of Pera destroyed two-thirds of that quarter. Loss estimated at 2,000,000 florins.
1791. Between March and July 32,000 houses are said to have been burned, and as many in 1795.
1799. In the suburb of Pera 13,000 houses were burned and many magnificent buildings.
1816. August 16. 12,000 houses and 3000 shops in the finest quarter were destroyed.
1818. August 13. A fire destroyed several thousand houses.
1826. A fire destroyed 6000 houses.
1848. 500 houses and 2000 shops destroyed. Loss estimated at £3,000,000.
1865. A great fire destroyed 2800 houses, public buildings, etc. Over 22,000 people were left homeless.
1870. June 5. The suburb of Pera, occupied by the foreign population and native Christians, was swept by a fire which destroyed over 7000 buildings, many of them among the best in the city, including the residence of the foreign legations. Loss estimated at nearly £5,000,000.
1797. *Scutari*, the town of 3000 houses totally destroyed.
1763. *Smyrna*, 2600 houses consumed. Loss, £200,000.
1772. " 3000 dwellings burned. 3000 to 4000 shops, etc. consumed. Loss, £4,000,000.
1796. " 4000 shops, mosques, magazines, etc., burned.
1841. " 12,000 houses were burned.

India.

1631. *Rajmahal*. Palace and great part of the town burned.
1799. *Manilla*, vast storehouses were burned.
1833. " 10,000 huts were burned, March 26. 30,000 people rendered homeless, and 50 lives lost.
1803. *Madras*, more than 1000 houses burned.
1803. *Bombay*. Loss by fire of £600,000.

China and Japan.

1822. *Canton* was nearly destroyed by fire.
1866. *Yokohama*, two-thirds of the native town and one-sixth of the foreign settlement destroyed.
1872. *Yeddo*. A fire occurred in April during a gale of wind, destroying buildings covering a space of 6 square miles. 20,000 persons were made homeless.
1873. " A fire destroyed 10,000 houses.

United States.

1679. *Boston*. All the warehouses, 80 dwellings, and the vessels in the dockyards were consumed. Loss, £200,000.
1760. " A fire caused a loss estimated at £100,000.
1787. " A fire consumed 100 buildings, February 20.
1794. " 96 buildings were burned. Loss, £42,000.
1872. " Great fire, November 9–10. By this fire the richest quarter of Boston was destroyed.

> The fire commenced at the corner of Summer and Kingston streets. The area burned over was 65 acres. 776 building, comprising the largest granite and brick warehouses of the city, filled with merchandise, were burned. The loss was about £15,000,000. Before the end of the year 1876 the burned district had been rebuilt more substantially than ever.

1778. *Charleston*. A fire caused the loss of £100,000.
1796. " 300 houses were burned.
1838. " One-half the city was burned on April 27. 1158 buildings destroyed. Loss, £600,000.
1802. *Portsmouth* (Maine), 102 buildings destroyed.
1813. " 397 buildings destroyed.
1820. *Savannah*, 463 buildings were burned. Loss, £800,000.
1835. *New York*. The great fire of New York began in Merchant street, December 16, and burned 530 buildings in the business part of the city. 1000 mercantile firms lost their places of business. The area burned over was 52 acres. The loss was £3,000,000.
1845. " A fire in the business part of the city, July 20, destroyed 300 buildings. The loss was £1,500,000. 35 persons were killed.
1845. *Pittsburg*. A large part of the city burned, April 11. 20 squares, 1100 buildings destroyed. Loss, £2,000,000.
1846. *Nantucket* was almost destroyed.
1848. *Albany*. 600 houses burned, August 17. Area burned over 37 acres, one-third of the city. Loss, £600,000.

1849. *St. Louis.* 23 steamboats at the wharves, and the whole or part of 15 blocks of the city burned, May 17. Loss, £600,000.

1851. “ More than three-quarters of the city was burned, May 4. 2500 buildings. Loss, £2,200,000.

1851. “ 500 buildings burned. Loss, £600,000.

1850. *Philadelphia.* 400 buildings burned, July 9. 30 lives lost. Loss, £200,000.

1865. “ 50 buildings burned, February 8. 20 persons killed. Loss, £100,000.

1851. *Washington.* Part of the Capitol and the whole of the Congressional Library were burned.

1851. *San Francisco.* On May 4–5 a fire destroyed 2500 buildings. A number of lives lost. More than three-fourths of the city destroyed. Loss upwards of £2,000,000. In June another fire burned 500 buildings. Loss estimated at £600,000.

1857. *Chicago.* A fire destroyed over £100,000. 14 lives lost.

1859. “ Property destroyed worth £100,000, Sept. 15.

1866. “ Two fires on August 10 and November 18. Loss, £100,000 each.

1871. “ The greatest fire of modern times.

It began in a barn on the night of the 8th of October and raged until the 10th. The area burned over was 2124 acres, or 3½ sq. miles, of the very heart of the city. 250 lives were lost, 98,500 persons were made homeless, and 17,430 buildings were consumed. The buildings were one-third in number and one-half in value of the buildings of the city. Before the end of 1875 the whole burned district had been rebuilt. The loss was estimated at £39,000,000.

1862. *Troy* (N. Y.) was nearly destroyed by fire.

1866. *Portland.* Great fire on July 4. One-half of the city was burned; 200 acres were ravaged; 50 buildings were blown up to stop the progress of the fire. Loss, £2,000,000 to £2,250,000.

1871. October. Forest and prairie fires in Wisconsin and Michigan. 15,000 persons were made homeless; 1000 lives lost. Loss estimated at £600,000.

BRITISH NORTH AMERICA.

1815. *Quebec* was injured to the extent of £260,000.

1845. “ 1650 houses were burned, May 28. One-third of the population made homeless. Loss from £400,000 to £750,000. Another fire, on June 28, consumed 1300 dwellings. 6000 persons were made homeless. 30 streets destroyed. Insurance losses, £60,770.

1866. “ 2500 houses and 17 churches in French quarter burned.

1825. *New Brunswick.* A tract of 4,000,000 acres, more than 100 miles in length, was burned over; it included many towns. 160 persons killed, and 875 head of cattle. 590 buildings burned. Loss about £60,000. Towns of Newcastle, Chatham, and Douglastown destroyed.

1837. *St. John* (New Brunswick). 115 houses burned, January 13, and nearly all the business part of the city. Loss, £1,000,000.

1877. “ Great fire on June 21. The area burned over was 200 acres. 37 streets and squares totally or in part destroyed; 10 miles of streets; 1650 dwellings. 18 lives lost. Total loss, £2,500,000. Two-fifths of the city burned.

1846. *St. John's* (Newfoundland) was nearly destroyed, June 9. Two whole streets burned upwards of one mile long. Loss estimated at £1,000,000.

1850. *Montreal.* A fire destroyed the finest part of the city on June 7. 200 houses were burned.

1852. “ A fire on July 9 rendered 10,000 people destitute. The space burned was one mile in length by half a mile in width, including 1200 houses. Loss, £1,000,000.

SOUTH AMERICA.

1536. *Cuzco* was nearly consumed.

1861. *Mendoza.* A great fire followed an earthquake which had destroyed 10,000 people.

1862. *Valparaiso* was devastated by fire.

1863. *Santiago.* Fire in the Jesuit church; 2000 persons, mostly women and children, perished.

WEST INDIES.

1752. *Pierre* (Martinique) had 700 houses burned.

1782. *Kingston* (Jamaica) had 80 houses burned. Loss, £500,000.

1795. *Montego Bay* (Jamaica). Loss by fire of £400,000.

1805. *St. Thomas.* 900 warehouses consumed. Loss, £6,000,000.

1808. *Spanish Town* (Trinidad) was totally destroyed. Loss estimated at £1,500,000.

1828. *Havana* lost 350 houses; 2000 persons reduced to poverty.

1843. *Port Republicain* (Hayti). Nearly one-third of the town was burned.

Such great fires as the above are due, first, to the combustible contents of buildings and of the materials they are built of, and to radical defects in the method of construction, and, secondly, to the want of proper means and appliances for promptly extinguishing fires and preventing the spread of them Wooden buildings crowded together in narrow crooked streets, insufficient supply or absolute want of water, no fire-engines or only the feeblest machines for pumping water, and no organized or trained and disciplined body of firemen, were the conditions in earlier times, and in some countries they are the conditions still.

It is of importance, however, to bear in mind that the loss of property by great fires or conflagrations is really small in proportion to the loss by fires of moderate proportions. Thus a very competent authority, Mr. Cornelius Walford, gives it as his opinion that great fires, properly so called, "involving the lost of £50,000 and upwards, probably do not account for more than one-fifth of the losses of any average year." With the gradual improvement of the organization for coping with fires, the disproportion of conflagrations year by year becomes greater, so that really small but oft-occurring fires are now, in all well-governed communities, the subject which demands the careful attention of authorities. No means at present exist for accurately estimating the average annual loss of property by fire throughout the world, as in scarcely any country is an official record of fires and their results kept; and the imperfect returns of insurance companies are of comparatively little significance. It is estimated that the value of the insured property destroyed by fire all over the world amounts to from thirty to forty millions of pounds sterling annually. (See INSURANCE.)

In modern times great improvements have been made in the means employed for the prevention and extinction of fires. Broad thoroughfares have taken the place of narrow crooked streets; incombustible materials, such as brick, stone (natural and artificial), and iron are used, not only for the exterior, but for the interior of important buildings as far as practicable; the introduction into cities of an abundant supply of water is common; the electric fire-alarm telegraph, powerful steam fire-engines, extension ladders, and fire-escapes are among the mechanical appliances now in daily use. The two essential elements of the problem, however, are the fire-resisting character of buildings, and the organizations of trained men who can make the modern appliances effective. The methods of organization and procedure differ in different countries.

Fires are dealt with, first and chiefly, by way of prevention; secondly, by prompt measures for extinction when they have begun; and thirdly, by circumscription or limitation when the fire has obtained such a hold of any building or range that the salvation of the burning property is beyond hope. In concerting preventive measures, a knowledge of the principal causes of fires is of the utmost consequence; and as bearing on the ordinary causes the following abstract of the results deduced from about 30,000 fires, which occurred in London during the thirty-three years 1833-65, possesses significance. The percentages of different causes were:—Candles 11·07, children playing 1·59, curtains 9·71, flues 7·80, gas 7·65, lucifers 1·41, smoking tobacco 1·40, sparks of fire 4·47, spontaneous ignition 0·95, stoves 1·67, other known causes 19·40, unknown causes 32·88. There is too much reason to suspect that a considerable proportion of fires attributed to no known cause are due to incendiarism; and were an official investigation into the origin of fires instituted, it most probably would result in a great saving of property. Among preventive measures the fire-proof building of large erections occupies an important place. Much can be done structurally to prevent and to limit fires, although it is now conceded that the thorough fire-proofing of any building is almost impracticable. The erection itself may be fire-proof, but no sooner is it stored with inflammable goods or property than it ceases to be invulnerable. It is of the utmost importance to reduce the danger of fire to a minimum in many public structures, as for example, public record offices, banks, and great libraries and museums, and in such establishments generally the most complete precautions are observed. Open fire places are discouraged, arched floors are provided, the use of exposed wood is, as far as possible, avoided, gas and other lights are most carefully arranged, and fire-buckets, hose, and other appliances are in readiness for any emergency, while the premises are constantly patrolled by watchmen.

For the prompt extinction of a fire in its incipient stages the water-buckets, hand-pumps, and extincteurs alluded to below are of the utmost value. When such means fail or are wanting, the services of fire brigades and salvage corps, if brought into requisition without loss of time, generally result in a great saving of property; but when a fire has obtained complete mastery of a building, it is a recognized fact that the most powerful engines, even aided with unlimited supplies of water, are ineffectual, and the efforts of the firemen are directed to confining the conflagration within the limits over which it has secured a hold. To cut off neighboring properties, the use of gunpowder and other means of breaking connection are frequently required.

Fire Extinction.

In coping with fires, water is the great agent employed; and in towns where the supply of water is abundant, and where especially there is a constant and high pressure in the mains, the task of the firemen is much simplified. In such cases it is frequently only necessary to attach the fire-hose to the plugs, and the pressure in the main pipe is sufficient, without the aid of any engine, to throw the jet over the whole burning mass. But it is only rarely that towns are so favorably situated, and for the equipment of an ordinary fire brigade and fire establishment the following among other appliances are required.

Hand-Pump and Bucket.—A small hand-pump which can be set into a bucket of water is the most effective means of distributing a small supply of water without waste. If judiciously used it will put out any fire in its earlier stages.

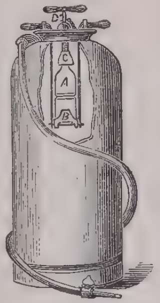

Fig. 1.—Portable Extinguisher.

The Portable Chemical Extinguisher (fig. 1), *Dick's Patent Extincteur*, etc., designed to answer the same purpose as the hand-pump and bucket, are now in extensive use in factories, warehouses, and public buildings. The vessel is a cylindrical tank, holding 7 gallons or upwards of water, and is carried on the back. Carbonic acid is generated at the moment of using within the vessel itself, and from its compressibility affords the power which projects the liquid. The working pressure varies from 70 to 120 ℔ per square inch, according to the temperature of the surrounding atmosphere; and the projectile range of the jet is from 40 to 50 feet.

Hand-Worked Engines consist essentially of a pair of single-acting force-pumps mounted on wheels and worked by hand. They vary much in size, weight and power, and are hauled by men or horses. Those most used in Paris are worked by eight men, and throw a $\frac{5}{8}$-inch jet to a height of 100 feet. Each pump is 5 inches in diameter, with $9\frac{1}{2}$-inch stroke. A smaller engine that may be carried into buildings by four men is also used. Those of the London fire brigade are worked most effectively by 26 to 30 men; pumps 6 or 7 inches diameter and 8 inches stroke. Each stroke (with 6-inch pumps) delivers $1\frac{2}{3}$ gallons of water. Still larger engines have been used, requiring 40 to 50 men. In the United States these as well as smaller hand-worked engines have given place to steam fire-engines, with pumps of the same size, in all the larger towns.

Steam Fire-Engines are essentially a pair of single-acting suction and force pumps driven by steam power. They are hauled by two horses, or are self-propellers. They weigh, as drawn to fires, from 5000 to 8000 ℔. Fig. 2 represents the kind that is most in use in the United States. The diameter of the cylinder in this engine is $7\frac{1}{2}$ inches, and that of the pumps $4\frac{1}{2}$ inches, with a stroke of 8 inches. The boilers are tubular, of sufficient capacity to work the pumps 500 strokes per minute. The usual working pressure of steam is 80 to 100 ℔ per square inch. The weight as drawn to fires is about 8000 ℔.

Chemical Engines are of several forms and sizes. The size most used consists essentially of two cylindrical copper or steel tanks, each holding 80 gallons of water (fig. 3). The charge for each tank is 28 ℔ bicarbonate of soda and 14 ℔ sulphuric acid. The soda is dissolved in the water, and the acid is held in a leaden jar within the tank, which is securely closed. At the moment of using the sulphuric acid is mixed with the water, and instantly combining with the soda causes carbonic acid to be given off with a pressure

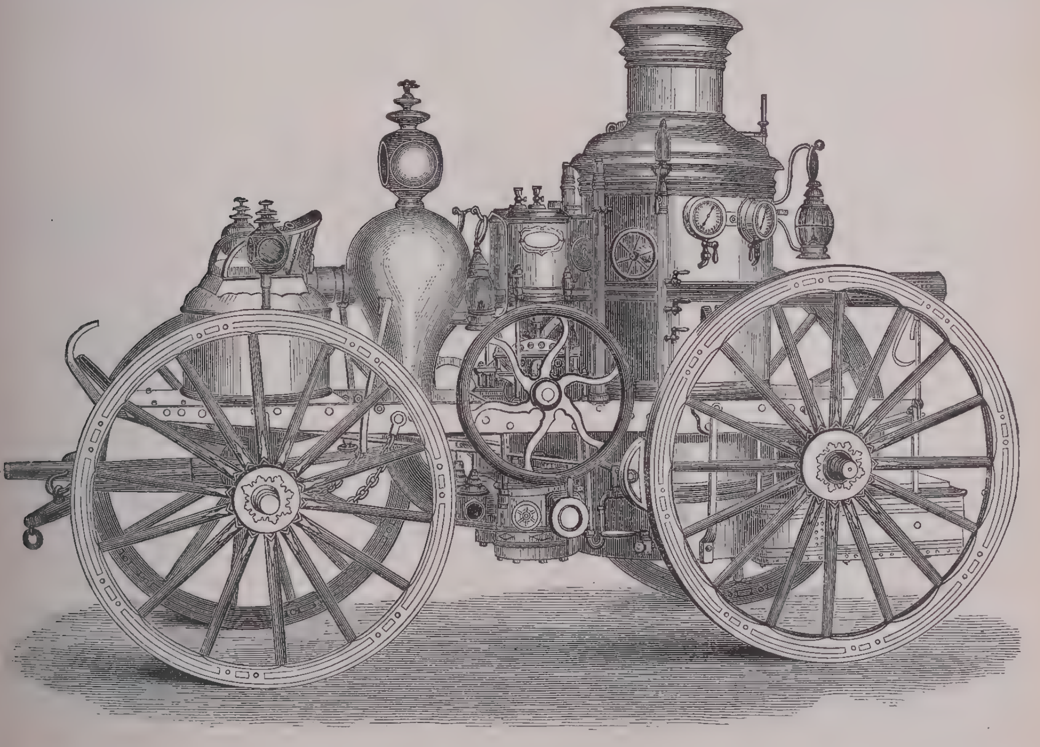

Fig. 2.—Steam Fire-Engine.

of 140 ℔ on the square inch. The tanks are used independently and charged separately, so that a continuous stream of water, usually ¼-inch jet, may be maintained. 300 feet of ¾-inch rubber hose is carried. The whole apparatus, charged and carrying three men, weighs about 5000 ℔, and is drawn by two horses. The hose is rarely carried upon the engine; it is usually on a separate carriage drawn by one horse. The reel carries about 1000 feet of 3½-inch rubber hose. Six hosemen ride on the carriage. The total load is about 3000 ℔.[1]

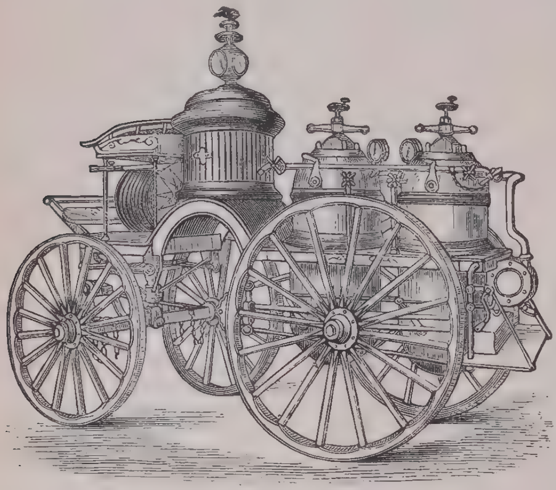

Fig. 3.—Chemical Engine.

Ladder Carriages carry from 20 to 25 ladders of various lengths (see fig. 4). Two ladders spliced reach 70 feet. The carriage fully equipped and carrying 12 men weighs from 7000 to 8000 ℔, and is drawn by two horses. The "aërial ladder" (so-called) reaches when fully extended a height of 100 feet, and is self-supporting; it is readily moved, when raised. It is made in 8 sections, each being a ladder about 12 feet long, and is put together and raised in six minutes. It is available as a fire escape. The total load with its carriage is about 6000 ℔.

Electric Fire-Alarm Telegraph.—Time is a most important element in all fires, and the purpose of this telegraph is to put it in the power of any one discovering a fire to make known the locality of it to the fire department in the shortest possible time. Throughout the town or city "alarm boxes" are placed, connected by telegraph wire with the central office and all the stations of the department. They are small iron boxes about a foot square, numbered in order and placed conspicuously on telegraph poles, or on the side of a building at corners of streets. Inside of each is a simple clock-work, which is set in motion by the pulling of a handle, and which records at the central office the number of the box. To guard against false alarms the outer door of the box is locked, but keys are kept at hand and are in the possession of all policemen and firemen.

The *Automatic Signal Telegraph* gives instantaneous notice at the headquarters of the fire department, or at the nearest engine-house, of the existence of a fire, by the action of the fire itself, and records there the number of the building and the room in which it occurs. The apparatus is very simple, and may be fully relied on. It consists of a small tube, called a thermostat, about 3 inches long, containing a spiral strip of metal, so arranged that the expansion due to a rise of thirty degrees above the ordinary temperature of the room in which it is placed, will close the connection between the two poles of a battery, and produce an electric current, which, passing through a small iron box containing a clock-work and circuit breaker, called a "transmitter," at once strikes a bell and starts a register at the nearest station of the fire department, which records the number of the building and the room in which the fire has broken out. The thermostat is placed upon the ceiling of each room at intervals of 25 feet throughout the building, the transmitter in every room that requires a separate signal. The signal is transmitted even when the wires are broken. This telegraph has been adopted in New York and Boston.

The electric arrangements connected with the fire brigade in the city of Glasgow, which have been devised by Mr. R. S. Symington, telegraph engineer, have been carried out on a scale of much efficiency and perfection. The city is divided into six fire districts, all connected by telegraph with the central principal station. There are also placed throughout the city 80 "electric fire-alarm boxes," at the corners of the principal streets, and the occurrence of fire can through these be instantly telegraphed to the nearest "fire station," and at the same time to the "central station." On the arrival of the first detachment, the "box" from which the signal was given is by an ingenious arrangement immediately converted into a "telegraph station" (for the time being), connecting all the stations, and enabling the firemaster to command the whole "staff." The firemaster, as also the principal men, reside on the premises at the central station; and men and horses are summoned by an electric-bell system leading into each man's bedroom. Besides the above arrangements there are placed in many warehouses and extensive establishments throughout the city about 2000 electric thermostats, by which the rising of a mercurial column causes a loud gong to sound, at once drawing attention to unoccupied or shut-up premises.

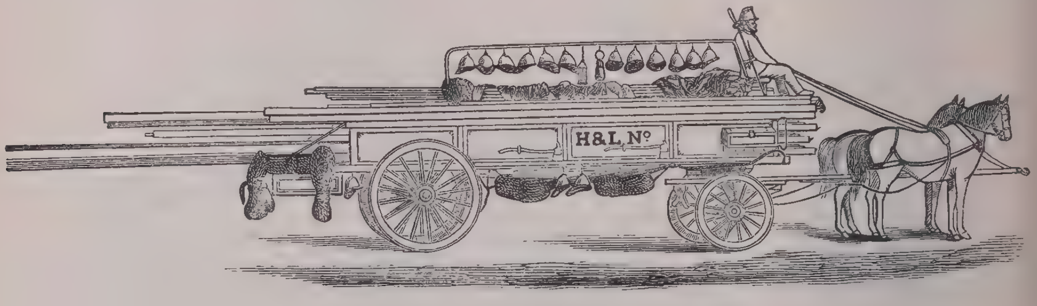

Fig. 4.—Ladder Carriage.

Organization.—The organizations of Paris and Berlin are similar, and are based upon the idea of small detachments of men, lighter machines, and a large number of stations, and on the presumption that no fire will have got beyond the control of the small detachment before it is discovered and made known. The results have been generally satisfactory under the conditions existing in those cities. In London larger detachments and fewer stations have given good results. In the principal cities of the United States different conditions have necessitated a proportionately larger force of men and more effective appliances.

---

[1] A combined manual and chemical fire-engine is made by Dick of Glasgow, which consists of an iron tank on wheels, divided into two galvanized compartments. It has two pumps, with vertical motion, connected with the suction pipes, to fill the compartments with water where the chemicals are dissolved, and two pumps to project the chemical liquid from each compartment into the air-chamber, where they combine and generate carbonic acid gas. The gas is held in solution by the water, and is conveyed direct to the fire, upon which it exercises its fire-extinguishing power. The engine can be worked by four or five men, and is capable of throwing 30 gallons of water per minute, containing 250 gallons of carbonic acid gas, a distance of 75 to 90 feet.

London.—The metropolitan fire brigade is a force of about 400 men under the control of the Board of Works, but under the immediate command of the "chief officer." The city is divided into a number of districts, each under a "superintendent." Within each district are fire-engine stations properly equipped, each under an "engineer." The force at these stations is the unit of organization. Each engineer has independent telegraphic communication with his superintendent, and he in turn with the chief officer. 26 steam fire-engines and 86 hand-worked engines are in use. Floating steam fire-engines protect the river front. The chief officer has absolute command at fires.

Paris.—The firemen are a corps, "sapeurs-pompiers," attached to the War Department, but at fires the corps acts under orders from the prefect of police. It is under the immediate command of a colonel, and is divided into 12 companies, the company being the unit of organization. Fire stations, manned by three men and provided with hand-pumps and fire-escapes, are distributed throughout the city. If the three men of a station, with bystanders impressed into the service by the police, are unable to extinguish the fire, men from other stations of the same company are summoned. Additional companies are called out by orders from headquarters of the corps. Hand-engines are the main reliance, but in 1876 five steam fire-engines were in use.

Berlin.—The department is subject to military discipline, and is under the command of a "fire-director" with subordinate officers. The city is divided into four inspection districts, with an officer in charge of each. Each district has numerous fire dépôts, according to its needs, and each dépôt is in charge of a fireman and four men, and is furnished with a small hand-engine, a hook and ladder, and a fire-escape. The principal stations are connected by telegraph.

New York.—The fire department of New York may be taken as the type of the best system now employed in the United States. It is on a military basis, under the control of a board of commissioners appointed by the mayor. The active force is under the immediate command of the "chief of department," and consists of 10 battalions, each of 6 companies, in all about 750 men. Each company, whether engine or ladder company, has its own house, where the men live and the apparatus is kept. The whole force is at all times on duty and in the houses, except such small detachments as are on street patrol or at their meals. The horses stand harnessed in their stalls, which are placed immediately in the rear of the engine, and are loosened by a simple mechanical appliance which, simultaneously with the striking of the alarm, opens the front of the stall; the horses, trained to move at the sound of the gong, advance rapidly each to his own place at the pole. They are instantly hitched in, the men spring to their seats, and the carriage is driven at high speed to the "alarm box" from which the alarm was given. To make sure that there will be a working pressure of steam on reaching the fire, the water in the engines, as they stand in the houses, is kept always at boiling point by the circulation of hot water from small stationary boilers, and fire is lighted in the engine the instant it leaves the house. Every effort is made to save even a few seconds of time, so that the interval between sounding the alarm and pumping water on the fire will average three minutes, and rarely exceeds five minutes. The city is divided into 10 battalion districts. The smallest of these represent each an area of about 5000 by 2000 feet, and comprise the most exposed parts of the city; but most of the districts are from two to three times as large. The signal boxes of the electric fire-alarm telegraph are placed conspicuously in the streets about 400 feet apart in the more crowded portion of the city, and from 1000 to 1200 feet in other portions. There are 540 in all. Alarms given from these boxes are instantly telegraphed from the headquarters of the department to each company house in the city. The first alarm calls out two or more companies previously designated; a second and third call out additional force. There are in use 57 steam fire-engines (5 of which are self-propellers), 1 steam fire-boat, 10 chemical engines, and 18 ladder carriages, including 5 "aërial ladders." The men are well-disciplined and skilful firemen.[1]

(A. P. R.)

FIRE-CLAY, FIRE-BRICKS.

Fire-clays may be defined as native combinations of hydrated silicates of alumina, mechanically associated with silica and alumina in various states of subdivision, and sufficiently free from silicates of the alkalies and from iron and lime to resist vitrification at high temperatures; the absence of the vitrifiable element is, however, merely a question of degree, as no native clays are wholly free from iron, the alkalies, lime, and the other alkaline earths.

Fire-clay may be looked upon as a special term for the gray clays of the Coal-Measures, interstratified with, and generally in close proximity to, the seams of coal, in beds varying from a few inches to many yards in thickness. They are locally known as "clunches" and "underclays," and are supposed to represent the soil that produced the vegetation from which the coal was formed.

The association of coal with the fire-clays of the carboniferous formation has localized the manufacture of fire-bricks, and by far the larger proportion are produced in the Coal-Measure districts, especially at Stourbridge, celebrated for producing a highly refractory brick, Broseley, Benthall, Madeley and Coalbrookdale in the Shropshire coal-field, and in the Midland, Yorkshire, North and South Wales, Durham, and the Scotch coal-fields; but in later years the area of fire-brick manufacture has much widened. There has been an extensive production since about 1850 from the Eocene clays in the neighborhood of Poole and Wareham in Dorsetshire; and a more limited supply from the Miocene between Bovey Tracey and Newton Abbot in Devonshire.

Still more recently Cornwall has become the seat of the manufacture, where, as at Calstock, Tregoning Hill near Breage, St. Ednor near St. Columb, and Lee Moor, fire-bricks of fine quality are made from china-clay refuse and disintegrated granite. Mr. Argall of the Tregoning Hill Company states that the locality was one of the first seats of china-clay mining between the years 1730 and 1750, and that in 1862 the present company commenced to make fire-bricks and tiles from the refuse of the clays, taking about two-thirds of silica and one-third of mica, which are mixed together in a pug mill, moulded and burnt in round ovens holding about 16,000 bricks, and that a very superior fire-brick is made from clay direct from the "stopes," containing

Silica	40·00	per cent.,
Alumina	37·00	"
Magnesia	2·00	"
Potash	9·00	"
Water	12·00	"

which are employed by founders, smelters, gas companies, etc. The price paid at the works is from 50s. to 55s. per 1000. The source of the materials is decomposed granite, of which Tregoning Hill consists.

The Hingston Down fire-clay deposit, near Calstock, supplying the Calstock fire-brick works, the Phœnix works, and the Tamar works in the same neighborhood, consists of a range of decomposed granite with an average width of three-quarters of a mile, running east and west for 3 or 4 miles, extending to an ascertained depth of from 300 to 400 feet, and intersected by mineral lodes. The Calstock Fire-Brick Company (limited), superintended by Mr. C. B. Evate, commenced operations in the year 1870, and manufactured from the decomposed granite fire-bricks of a highly refractory character, which are delivered free on board at the port of Calstock at from 50s. to 60s. a thousand, weighing about 3½ tons. Another source of fire-brick material, scarcely yet developed, is the pockets or depressions occurring in the mountain limestone of North Wales, Derbyshire, and Ireland, containing white refractory clays and sands, the insoluble remnants from the local dissolution of the limestone, intermixed with the débris of the overlying millstone grit. These clays and sands when evenly mingled are sufficiently adhesive to be moulded, and their small contractility and highly refractory character render them pre-eminently suitable for fire-brick manufacture. Fire-brick works have already been established on the estate of Captain Cooke of Colomendy Hall, near Mold, and the refractory clays and sands are largely employed for lining furnaces, 3000 tons having been sold for this purpose alone in the year 1877.

The fire-clays of the Coal-Measures vary as regards their refractory character, not only in the different coal-fields, but the individual strata in close alternation often present sudden variations, refractory beds being interstratified with useless strata largely charged with disseminated carbonate of iron. The gray color of the Coal-Measure clays is partially due to the presence of this mineral, which, whether disseminated through the mass or otherwise occurring in excess as concretionary nodules, is prejudicial to the clays as a material for fire-bricks. Carbonaceous matter is also present in variable proportions, coloring the clay from a slaty-black to a pale gray, but as this is eliminated in the earlier stages of the burning of the bricks, its presence in no way influences their refractory character.

---

[1] The foregoing article is reprinted by permission of Messrs. Little, Brown & Co., Boston, Mass., from *Great Fires and Fire Extinction*, by General Alfred P. Rockwell, Boston, 1878.

The relative proportion of silica and alumina which some manufacturers have laid undue stress upon as indicating heat-resisting quality is of little moment, as both these constituents, whether occurring in combination as silicates of alumina, or as free alumina and silica, are essentially the refractory elements of all good fire-bricks, being unvitrifiable *per se*, excepting when associated with the alkalies, lime, or oxides of iron. The plastic character of refractory clays is also of limited influence on their suitability for fire-brick manufacture; extreme plasticity, which is generally accompanied by excessive contractility and vitrifiability, is prejudicial. As a rule few clays or materials used in the manufacture of fire-bricks are insufficiently plastic to prevent their being easily moulded, and in the manufacture by the *dry process*, or the compression of the brick out of nearly dry pulverized clay, plasticity is not so essential a quality. As regards chemical composition the following analyses indicate its general character, and the variability of the proportion of the constituents of some of the more important fire-clays :—

Coal-Measure Clays.

A. *Stourbridge Clay.* (Omitting the water.)

Silica	70·60
Alumina	26·60
Oxide of iron	2·0
Lime	1 40
Magnesia	traces.

B. *Stourbridge Clay.* (Analysis by Richardson.)

Silica	70·50
Alumina	25·46
Protoxide of iron	2·04
Magnesia	1·05

C. *Glass House Pot Clay, Tintam Abbey, Stourbridge.* (Analysis by A. W. Wills.)

Silica	73·82
Alumina	15·88
Protoxide of iron	2·94
Alkalies	0·90
Water	6·45

D. *"Best Clay," Tamworth.* (Analysis by A. W. Wills.)

Silica	71·40
Alumina	21·17
Protoxide of iron	0·91
Lime	0·04
Alkalies	0·82
Water	6·06

E. *Fire-Brick Clay from Newcastle.* (Analysis by H. Taylor.)

Silica	55·50
Alumina	27·75
Sesquioxide of iron	2·01
Lime	0·67
Magnesia	0·75
Alkalies	2·63
Water	10·53

F. *Fire-Clay from Newcastle.* (Excluding the water.)

Silica	69·25
Alumina	17·90
Oxide of iron	2.97
Magnesia	1·30
Lime	7·58

G. *Clay from Glasgow,* used for saggars, glass house pots, bricks, etc. (Percy's *Metallurgy.*)

Silica	66·16
Alumina	22·54
Protoxide of iron	5·31
Lime	1·42
Water	3·14

H. *Dinas Fire-Clay, South Wales.* (Excluding the water.)

Silica	91.95
Alumina	8·05

With traces of iron.

J. *Fire-Clay from Dowlais.* (Analysis by J. E. Rily.)

Silica	67·13
Alumina	21·18
Sesquioxide of iron	1·85
Lime	0·32
Magnesia	0·84
Alkalies	2·02
Organic matter	0·90
Water	6 21

K. *Welsh Fire-Clay.* (Excluding the water.)

Silica	80·10
Alumina	17·90
Oxide of iron	1·0
Lime	1·0

Note.—In comparing the percentages of the individual constituents, it must be noticed that some of the analyses exclude the water.

Tertiary Clays of Dorset and Devon used for Fire-Brick Manufacture.

L. *White Clay, Branksea Island, Dorset.* (Analysis by Professor Way.)

Silica	65·49
Alumina	21·28
Oxides of iron	1·26
Alkalies and alkaline earths	7·25
Sulphate of lime	4·72

M. *Black Clay, Branksea Island, Dorset.* (Analysis by Professor Way.)

Silica	72·23
Alumina	23·25
Oxides of iron	2·54
Alkalies and alkaline earths	1·78

N. *Beacon Hill Clay, near Poole.* Lower Bagshot Beds.

Silica	63·00
Alumina	33·50
Oxide of iron	1·00
Magnesia	2·00

O. *Beacon Hill Clay, near Poole.* Lower Bagshot Beds.

Silica	53 52
Alumina	33·68
Lime	0·76
Magnesia	0·14
Oxide of iron	0·52
Alkalies	0·04
Water	11·34

P. *Blue Ball Clay, Bovey Tracy, Devon.* Miocene Lignite Formation.

Silica	47·00
Alumina	48·00
Oxides of iron	1·5
Magnesia	2·0
Water, etc	1·5

The above analyses indicate a preponderance of silica in the Coal-Measure fire-clays compared with the Tertiary clays of Devon and Dorset, in which a larger proportion of alumina occurs. The latter character is accompanied by tenacity and plasticity, and greater contraction in drying and burning, which, when excessive, is counteracted by mingling with the clay sand and ground burnt clay or sherds.

Contractility.—The contraction in burning (excluding the contraction in drying) of several Coal-Measure fire-clays pressed out of nearly dry pulverized clay was ascertained by the writer to be as follows:

Fire-clay occurring between the "Penystone Measure and "Vigor's" clay, Shropshire coal-measures, near Broseley	1	per cent.
"Two-foot coal" fire-clay, Shropshire coal-measures	5	"
"Ganie coal" fire-clay, Shropshire coal measures	2	"
Bewdley Forest fire-clay, from the works of Mr. Mobberly, Bewdley, No. 1	3	"
Do. do. No. 2	4	"
Do. do. No. 3	1	"
Stourbridge fire-clay, from Messrs. Fisher Brothers, "The Hayes," Stourbridge, No. 1	1	"
Do. do. No. 2	1	"
"Best" fire-clay, from the earl of Dudley's pits near Dudley	2	"
"Seconds" and offal, from same	1	"
Fire-clay, Maryport, Cumberland	4	"

The average contraction of the Coal-Measure fire-clays is thus little over two per cent. A brick manufactured from the best Stourbridge clay without admixture of burnt material contracted seven-eighths of an inch in nine inches, but this would probably represent the contraction both in drying and burning. The contraction in burning of the Tertiary fire-clays used for the manufacture of fire-bricks in Devon and Dorset is much more than that of the Coal-Measure clays.

Contractility of Devonshire Clays.

"Best pipe-clay," Miocene Lignite Formation, Bovey Tracey, from the works of Messrs. Watts, Blake, Bearne & Co	12	per cent
"Cutty clay"	8	"
"Household clay"	5	"
"Stoneware clay"	7	"
"Alum-makers' clay"	7	"
"Drain pipe clay"	4	"
"Blue ball clay"	13	"
"Black ball clay"	11	"
"Brown ball clay"	11	"
"Black carbonaceous clay"	10	"

Average contraction a little under 9 per cent.

Contractility of Dorsetshire Clays. Lower Bagshot (Eocene) Beds.

"White clay" from Messrs. Pike's works, Wareham	10	per cent.
"T" clay	11	"
"V" clay	13	"
"Black" clay	13	"
"Blue" clay	13	"
"H" clay	15	"
"P" clay	15	"
"S" clay	7	"
Mottled sandy clay, Lower Bagshot Beds, Wareham	1	"
Clay from Upper Plant Bed, Lower Bagshot Beds, Studland Bay, Dorset	6	"

The clays above enumerated are not exclusively used for fire-brick manufacture, but fairly indicate the general cha racter of the Tertiary fire-brick clays, which, compared with the Coal-Measure fire-clays, are characterized by a preponderance of alumina, tenacity of texture, contractility in the kiln, and an absence of iron and the alkalies, etc., which tend to vitrification. Tenacity of texture in a fire-brick material is, however, a mechanical condition, which, *cæteris paribus*, assists vitrification, a coarse open body being more refractory than a close homogeneous brick of similar chemical composition. A well manufactured brick should be of a pale cream or clear buff color, uniform throughout its mass, and burnt to the full extent of its contractility.

The chemical changes which take place in the burning consist first, of the destruction of the disseminated carbonaceous matter, the dehydration of the silicates of alumina, destroying their plastic character, and the decomposition of the disseminated carbonate of protoxide of iron, converting it into anhydrous sesquioxide, to which the yellow color of the burnt brick is due; if the burning is carried to a high state of vitrification the yellow tint is replaced by a dull gray, due to the partial reduction of the sesquioxide of iron and its conversion into silicate of protoxide or minutely disseminated particles of metallic iron; any alkalies present also form vitreous combinations with the silica during the latter stages of the burning. The paleness of color of a fire-brick is not always a safe indication of the absence of iron, as the presence of a large proportion of carbonaceous matter in the clay tends to bleaching by the reduction of the coloring sesquioxide to a lower oxide preserved as a silicate in a comparatively colorless condition. Again, the presence of lime and the other alkaline earths, which are disadvantageous fluxing elements, will cloak the coloring power of a large percentage of oxide of iron by the formation of a pale double silicate of lime and iron. This is taken advantage of in the manufacture of buff building bricks by mixing ground chalk with ferruginous clays which would otherwise burn dark red.

A properly burnt brick, uniform in color throughout its mass, can only be obtained by slow progressive firing; a broken brick that has been too quickly burnt, though pale on the surface, presents a darker central patch and concentric rings of various shades of color, due mainly to the different states of oxidation of the iron, and partly to the presence of unconsumed carbonaceous matter; but the chemistry of this color-variegation is not clearly understood.

Durability of Fire-Bricks.—The destruction and wearing out of a fire-brick in its ordinary uses takes place in different ways. First, it may waste by crumbling and shattering; this occurs only when the brick is unnecessarily porous in texture, or from the presence of extraneous lumps of foreign materials, such as small pebbles and fragments of lime and iron-stone, which the manufacturer endeavors to get rid of by sifting or crushing before the clay is moulded. Secondly, the gradual vitrification of the brick under the pressure of the superimposed structure distorts its form, and the semiplastic red-hot or white-hot mass is gradually squeezed out of shape, and has to be periodically replaced in the hotter parts of the furnaces and kilns. However completely a brick has been burnt, bringing its dimensions almost to the limit of contractility, constant exposure to long-continued heat still further reduces its bulk, causing the displacement of the mass of which it forms a part, and necessitating replacement and repairs. Thirdly, there is the gradual fretting away of the exposed brick surface by vitrification, however refractory a brick may be; when it lines flues and furnaces, the fumes and ashes incessantly carried into contact with it bring foreign accessions, which vitrify the exposed portions and form a coating of viscid slag, which eats into the brick surface, creeping down and clogging the flues and fire-holes with a vitreous mass. In the case of blast-furnaces the fretting away of the surface of the fire-brick linings gradually enlarges their capacity, the surface destruction decreasing from the tweers upwards, the faces opposite the impact of the blast being distinctly excavated beyond the outline of the enlarged circumference. In one of the furnaces of the Madeley Wood Company, Madeley, Shropshire, "blown in" in 1867 and "blown out" in 1874, the diameter at the base, originally 3 feet, had been enlarged to about 7 feet 6 inches, and at the widest part, a little below the middle, from 12 feet, its original diameter, to 13 feet. In another furnace, after ten years' blast, the original diameter of 4 feet 5 inches at the base had been enlarged to 9 feet 6 inches; at a third of its height from 9 feet 11 inches to 12 feet; and half way up, from 11 feet 9 inches to 12 feet 10 inches, the destruction of brick-surface gradually decreasing towards the top, where the increase of size was but trifling. This would represent a consumption of brick-surface of from 3 to 4 inches a year at the tweers, and about three-quarters of an inch a year towards the middle of the furnace.

It is beyond the scope of this article to enter into the details of fire-brick manufacture, which in its main features resembles the manufacture of building bricks, except that fire-bricks are rarely if ever burnt in clamps.

Properly constructed ovens on the "down-draft" principle, with the outlet from the bottom into a tall chimney, are now almost universally employed, as they ensure greater regularity in the burning than in the old form of kiln, with a direct escape from the top, as well as economy in fuel. The consumption of coal varies from 9 to 15 cwt. per 1000 bricks, exclusive of the coal used in the drying stoves.

Coal-Measure fire-clays are often mined in an almost rocky condition, requiring long exposure to the weather to effect their disintegration. The softer clunches or clays are sometimes prepared for the moulder by "weathering," but the more common practice is to grind the fire-clay just as it comes from the pit under heavy "runners" or rollers, effecting a granular texture which is a desirable quality in a refractory brick. It is now becoming a common practice to grind up with the raw clay from one-fourth to one-third of its weight of broken burnt sherds or fire-bricks. All waste materials are thus utilized, and the excessively contractile character of highly plastic clays such as those of Dorsetshire is counteracted. Siliceous sand is also sometimes mixed with the more plastic clays to reduce their contractility.

The ground clay is either brought into a plastic state with water in a pug-mill and moulded by hand, or by brick-moulding machinery generally connected with the pug-mill outlet; or the partially moist ground-clay dust is compressed into bricks in iron moulds by steam power, a modification of Prosser's well-known process. More shapely bricks are thus produced than by plastic moulding, and their perfectly true flat sides enable a minimum of jointing materials to be employed—a circumstance of importance in the stability of fire-brick masonry, as thick fire-clay jointing contracts in the firing, tending to shatter the structure.

In addition to the use of fire-clay for the bedding of all fire-brick structures, it forms the materials of gas retorts, crucibles, and every kind of potter's kiln furniture, such as saggars, cranks, slip kiln bottoms, enamel kiln linings, etc. These have been up to within the last year or two moulded out of plastic clay, but by processes and machinery recently patented by Mr. A. Maw, saggars, cranks, and every kind of kiln furniture can be moulded out of nearly dry pulverized clay, at a great reduction in cost below that of the plastic process, and the exact regularity of form attained effects a large saving of space in the ovens and kilns. Moreover, the even bearing on each other of the regularly-shaped saggars when piled up in the oven, reduces the "wear and tear" and breakage to a minimum. Fire-bricks vary much in price in the different producing districts,—about 40s. per 1000 may now be looked upon as a minimum, ranging up to 70s. and 80s., further augmented by the cost of carriage to other districts. A thousand fire-bricks weigh from 3¼ to 4 tons. (G. M.)

FIRENZUOLA, Agnolo (1493–*c.* 1545), Italian poet and littérateur, was born at Florence, September 28, 1493. The family name was taken from the town of Firenzuola, situated at the foot of the Apennines, its original home. The grandfather of Agnolo had obtained the citizenship of Florence and transmitted it to his family. Agnolo was destined for the profession of the law, and pursued his studies first at Siena and afterwards at Perugia. There he became the associate of the notorious Pietro Aretino, whose foul life he was not ashamed to make the model of his own. They met again at Rome, where Firenzuola practised for a time the profession of an advocate, but with little success. It is asserted by all his biographers that while still a young man he assumed the monastic dress at Vallambrosa, and that he afterwards held successively two abbacies. Tiraboschi alone ventures to doubt this account, partly on the ground of Firenzuola's licentiousness, and partly on the ground of absence of evidence; but his arguments are not held to be conclusive. Firenzuola left Rome after the death of Pope Clement VII., and after spending some time at Florence, settled at Prato as abbot of San Salvatore. His writings, of which a collected edition was published in 1548, are partly in prose and partly in verse, and belong to the lighter classes of literature. Among the prose works are—*Discorsi degli Animali*, imitations of Oriental and Æsopian fables, of which there are two French translations; *Dialogo delle Bellezze delle Donne*, also translated into French; *Ragionamenti Amorosi*, a series of short tales in the manner of Boccaccio, rivalling him in elegance and in licentiousness; *Discacciamento delle Nuove Lettere*, a controversial piece against Trissino's proposal to introduce new letters into the Italian alphabet; a free version or adaptation of *The Golden Ass* of Apuleius, which became a favorite book and passed through many editions; and two comedies, *I Lucidi*, an imitation of the *Menæchmi* of Plautus, and *La Trinuzia*, which in some points resembles the *Calandria* of Cardinal Bibbiena. His poems are chiefly satirical and burlesque. All his works are esteemed as models of literary excellence, and are cited as authorities in the vocabulary of the Accademia della Crusca. The date of Firenzuola's death is only approximately ascertained. He had been dead several years when the first edition of his writings appeared (1548). His works have been very frequently republished, separately and in collected editions. A convenient reprint of the whole was issued at Florence in 2 vols. in 1848.

FIREWORKS. See PYROTECHNY.

FIRMICUS, MATERNUS JULIUS, the name of a Latin writer, and most probably of two, who lived in the reign of Constantine and his successors. About the year 347 one of them composed a work entitled *De Erroribus Profanarum Religionum*, which he inscribed to Constantius and Constans, the sons of Constantine, and which is still extant. During the life of Constantine a person of the same name as the author of the work on Christianity commenced his eight books on astronomy, which were not completed however till 354 A.D. They were first printed by Aldus Manutius in 1501, and have been reprinted several times since. The work is interfused with Neo-Platonic philosophy, and its spirit is hostile to Christianity. Its diction in some cases resembles that of the Christian work, but it is impossible that two works so contradictory in tone and spirit could have been written by the same person at the same period; and even if it be supposed, contrary to the evidence, that the Christian work was written subsequent to the heathen one, all the contradictions between them would not be accounted for.

The Christian work is preserved in a Palatine MS. in the Vatican libary. It was first printed at Strasburg in 1562, and has been reprinted several times, both separately and along with the writings of Minucius Felix, Cyprian, or Arnobius. The most correct editions are those by Conr. Bursian, Leipsic, 1856, and by C. Halm, in his *Minucius Felix*, Vienna, 1867.

FIROZPUR, or FEROZEPORE, a district of British India in the Lahore division or commissionership under the jurisdiction of the lieutenant-governor of the Punjab, lies between 30° 18′ 12″ and 31° 10′ 36″ N. lat., and 74° 5′ and 75° 29′ E. long. It is bounded on the N. by Lahore, Amritsar, and Kapurthálá state, E. by Jalandhar and Ludhiána, S. by Patiála, Nabhá, and Faridkot states, and W. by Sirsá. The surface of the district is level, with the exception of a few sand-hills in the south and south-east. The country consists of two distinct tracts, that liable to annual fertilizing inundations from the Sutlej, known as the *bhet*, and the *rohi* or upland tract. The only river is the Sutlej, which runs along the north-western boundary. The census of 1868 returned the population at 303,489 males and 245,764 females—total 549,253, of whom 68,406 were Sikhs, 245,659 Mahometans, 160,487 Hindus, and 74,701 "others." The area of the district is 2740 square miles, or 1,753,250 acres, of which 1,243,508 are cultivated, 377,722 cultivable, and 132,020 uncultivable and waste. The principal crops are wheat, barley, millet, gram, pulses, oilseeds, cotton, tobacco, etc. The manufactures are of the humblest kind, consisting chiefly of cotton and wool-weaving, and are confined entirely to the supply of local wants.

The Lahore and Ludhiána road runs for 51 miles through the district, and forms the chief trade route. The chief town and administrative headquarters of the district is Firozpur. The other important towns and seats of commerce are Mahrág, population 5681; Dharmkot, 5379; Moga, 4844; Muktsar, 4694; and Zira, 3010. The district revenue in 1872–73 amounted to £61,141, of which £49,713 was derived directly from the land. For the protection of person and property there are 12 revenue and civil and 13 magisterial courts, a regular police force of 388 officers and men, a municipal police of 75 men, and a rural constabulary of 542 men. For educational purposes 121 schools, attended by 3487 pupils, are maintained or subsidized by the state, at a cost of £1299. Owing principally to the dryness of its climate, Firozpur has the reputation of being an exceptionally healthy district. In September and October, however, after the annual rains, the people suffer a good deal from remittent fever. The average annual rainfall is 20·9 inches. British rule was first established at Firozpur in 1835, when on the failure of heirs to the Sikh family who possessed it, a small territory 86 miles in extent became an escheat to the British Government, and the present district has been gradually formed around this nucleus. Firozpur was the scene of operations during the first Sikh war. The Sikhs crossed the Sutlej in December, 1845, were defeated successively at Mudki, Firozsháh, Aliwál, and Sobráon; after which they withdrew into their own territory, and peace was concluded at Lahore. At the time of the mutiny, Firozpur cantonments contained two regiments of native infantry and a regiment of native cavalry, together with the 61st Foot, and two companies of European artillery. One of the native regiments, the 57th, was disarmed; but the other, the 45th, broke into mutiny, and, after an unsuccessful attempt to seize the magazine, which was held by the Europeans, proceeded to join the rebel forces in Delhi. Throughout the mutiny Firozpur remained in the hands of the English.

FIROZPUR, the civil headquarters of the district of the same name, also a military cantonment, is situated on the old bank of the Sutlej, in 30° 57′ N. lat. and 74° 10′ E. long. The city contains a population of 20,592, according to the census of 1868, of whom 7181 are Hindus, 11,171 Mahometans, 1347 Sikhs, and 893 "others." It has been constituted a municipality of the second class; municipal income in 1872–73, £4033; expenditure, £3962; rate of taxation per head, 3s. 10½d. Firozpur has rapidly advanced in material prosperity of late years, and is now a very important seat of commerce. The main streets of the city are wide and well paved, and the whole is inclosed by a low brick wall. Great improvements have been made in the surroundings of the city. The cantonment lies two miles to the south of the city, and is connected with it by a good metalled road. The garrison now consists of one regiment of British infantry, one of native infantry, one battery of field and one of garrison artillery. The arsenal to which Firozpur owes its political importance is situated one mile distant from cantonment. It is by far the largest in the province, and well stored with all munitions of war. The population of Firozpur cantonments and military lines amounted in 1868 to 15,837.

FISCHART (1546–1590), **JOHANNES**, the great German satirist of the 16th century, was born probably at Strasburg (according to some accounts at Mainz), in 1546, and was educated at Worms, in the house of Kaspar Scheid, whom he mentions in the preface to his *Eulenspiegel* as his "cousin and preceptor." After taking the degree of Doctor der Rechte at Basel in 1570, he left Germany for a time, and is said to have travelled in Italy, the Netherlands, France, and England. Having returned to Strasburg, he lived there from 1576 to about 1580 with his brother-in-law the printer, Bernhard Jobin, who became the publisher of most of Fischart's works. In 1581 Fischart became Advocat am Reichskammergericht at Spire, and in 1583 Hohenfelsischer Amtmann at Forbach, near Saarbrück. Here he died in the winter of 1589–90, at the age of forty-three. Fischart wrote under various feigned names, such as Mentzer, Menzer, Reznem, Huldrich Elloposkleros, Jesuwalt-Pickhart, Winhold Alkofribas Wüstblutus, and Huldrich Mansehr von Treubach; and it is partly owing to this fact that there is doubt whether some of the works attributed to him are really his. More than 50 satirical works, however, both in prose and verse, remain authentic, among which are—*Der Nachtrabe*, or *Die Nebelkräh* (1570), a satire against one Jacob Rabe, who had become a convert to the Catholic Church; *Von St. Dominici des Predigermönchs u. St. Francisci Barfüssers artlichem Leben* (1571), a poem with the expressive motto "Sie haben Nasen vnd riechens nit," written to defend the Protestants against certain wicked accusations, one of which was that Luther held communion with the devil; *Eulenspiegel Reimensweis* (1572); *Allerpraktik Grossmutter* (1572), after Rabelais's *Prognostication Pantagrueline; Flöhatz Weibertratz* (1574); *Affenteuerliche und ungeheuerliche Geschichtschrift vom Leben, Rhaten und Thaten, u. s. w., von Gargantoa u. Pantagruel,* also after Rabelais (1575, and again under a modified title 1577); *Neue künstliche Figuren Biblischer Historien* (1576); *Anmahnung zur christlichen Kinderzucht* (1576); *Das glückhaff Schiff von Zürich* (1576, repub. 1828 and 1849), a poem commemorating the adventure of a company of Zurich arquebusiers, who sailed from their native town to Strasburg in one day, and brought, as a proof of this feat, a kettleful of "Hirsebrei," which had been cooked in Zurich, still warm into Strasburg; *Podagrammisch Trostbüchlein* (1577); *Das philosophisch Ehzuchtbüchlein* (1578); the celebrated *Bienenkorb des heiligen römischen Immenschwarms,* etc., a modification of the Dutch *Bynencorf der roomischer kerke,* by Philipp Marnix of St. Aldegonde, published in 1579 and again in 1847; *Der heilig Brotkorb* (1580), after Calvin's *Traité des Reliques; Das vierhörnige Jesuiterhüttlein,* a rhymed satire against the Jesuits (1580); *Catalogus Catalogorum perpetuo durabilis* (1589). To Fischart also have been attributed some "Psalmen und geistliche Lieder" which appeared in a Strasburg hymn book of 1576. Fischart had studied not only the ancient literatures, but also those of Italy, France, the Netherlands, and England. He was a lawyer, a theologian, a satirist, in religion a staunch Protestant, in politics a republican. Above all, he is reputed a master of language, and was indefatigable with his pen. His satire was levelled mercilessly at all perversities in the public and private life of his time,—at astrological superstition, scholastic pedantry, ancestral pride, but especially at the papal dignity and the lives of the priesthood and the Jesuits. He indulged in the wildest witticisms, the most abandoned caricature; but all this he did with a serious purpose. Thirty years after Fischart's death his writings, once so popular, were almost entirely forgotten. Recalled to the public attention by Bodmer and Lessing, it is only quite recently that his works have come to be a subject of investigation, and his position in German literature to be fully understood. There is a collection of Fischart's works in the royal library at Berlin.

FISHER, **John**, bishop of Rochester, was born at Beverley in Yorkshire, but the year of his birth is uncertain, some placing it in 1459, others in 1461, and others in 1465. He was educated in the collegiate church of Beverley, and in 1484 he removed to Michael House in Cambridge, of which college he was elected master in the year 1495. Having applied himself to the study of divinity, he took orders; and becoming eminent as a divine, attracted the notice of Margaret, countess of Richmond, mother of Henry VII., who appointed him her chaplain and confessor. In 1501 he took the degree of doctor in divinity, and the same year was elected chancellor of the university. In the year following the first appointment of the newly-established Margaret professorship in divinity was conferred upon him; and in 1504 he was consecrated bishop of Rochester. Fisher has been erroneously credited with the composition of the *Assertio Septem Sacramentorum,* in which Henry VIII. attacked the heretic Luther, and for which the pope conferred upon his Majesty the title of "Defender of the Faith." Sir Thomas More and Fisher, however, published their respective rejoinders to the Reformer's reply to the king. Hitherto he had retained the friendship and esteem of the king; but from 1527 till his death he was acknowledged as, next to Sir Thomas More, the most influential man of the anti-royal or papal party in England. He published a pamphlet against the divorce of Catherine of Aragon, which was widely disseminated on the Continent, and also secretly circulated in England. In 1533 the parliament found him guilty of misprision of treason, for concealing certain prophetic speeches of Elizabeth Barton, a fanatical impostor known as the Holy Maid of Kent, relative to the king's death, and condemned him, with five others, to suffer loss of goods and imprisonment during his majesty's pleasure. He was subsequently released upon payment of a fine of £300. Fisher excused his silence on the ground that the nun had told him that she had communicated her prophecies to Henry in person, but he nevertheless refused to express regret for having been unwittingly connected with treasonable designs. As to the great question of the day, Fisher offered to swear to the succession in the line of Anne Boleyn's issue, but he refused to acknowledge either the validity of her marriage or the king's supremacy. For this refusal he was attainted by the parliament of 1534, and committed to the Tower. At this juncture Pope Paul III. sent him a cardinal's hat. This kindness, however, only hastened the bishop's ruin. He was beheaded at Tower Hill on the 22d of June, 1535. It is impossible to withhold from Fisher, notwithstanding his inflexible enmity to the Reformation, the character of a learned, pious, and honest man. His works attest his learning; his inflexible zeal for his faith, and the readiness with which he died for his creed, plainly prove his honesty as well as his piety. His execution was a sad tragedy, defensible only on the plea of political necessity. For the latest apology for Bishop Fisher, see the Rev. R. W. Watson's *History of the English Church,* vol. i., 1877.

Fisher was the author of a considerable number of controversial tracts, most of which were collected and printed in one volume folio, published at Wurtzburg in 1595. A Life of Fisher, by Rev. John Lewis, A.M., was published in 1855, in two volumes.

FISHERIES. Under the heading Sea Fisheries, which form the particular subject of the present article,[1] may be included the various operations engaged in for the capture of the different forms of marine life which, in some manner or other, minister to the wants or convenience of man. The most important of these fisheries—those only, in fact, to which the title strictly belongs, and which have more or less widely occupied attention from probably the earliest times—are carried on chiefly by hook and line or net, with the object of obtaining fish for the purposes of food; and this main division of the general subject will be here considered.

Importance of the industry.

Although little or nothing is known of the methods of fishing on our coasts in very early times, there can be no doubt that in England, as in all maritime countries, fish has always been eagerly sought after as an easily procurable article of food. The abundance of herrings and mackerel, for instance, on the coasts at regular seasons of the year, could not have failed to attract attention; and Swinden, in his *History and Antiquities of Great Yarmouth,* expresses his belief that the herring fishery began there soon after the year 495. In Scotland also there is evidence that the herring fishery was systematically carried on from a very early date. Precise records of other fisheries do not go back so far as that of the herring; but there is no reason for believing that cod and kindred fishes were not taken by the hook and line very many centuries ago, and, like the herring, were subjected to some ready mode of curing either with salt or by drying in the open air. In comparatively recent times all the fisheries have been largely developed, and none more so than that known as beam-trawling, a method of fishing which had probably attracted little notice a hundred years ago, but is now the most regularly productive and important on the English coast. Many circumstances have combined to encourage the working of sea fisheries as a national industry. The great extent of coast-line surrounding the British Islands provides ready access to the sea to a numerous population who become familiar from their youth with seafaring pursuits; and to such occupations large numbers betake themselves with instinctive aptitude, either as fishermen or sailors. In many cases early associations lead them to devote themselves to such fisheries as are within reach of their native villages; in others, they may become alternately sailors and fishermen, shipping for a few months every year on a trading voyage, and returning home in time to take part in the herring or some other temporary but profitable fishery; whilst in the case of the deep-sea trawling or cod fishery, they learn to become as good sailors as they are fishermen, for they have often to remain at sea in decked vessels for weeks at a time in all kinds of weather, —they must keep on their fishing ground, and must trust to their knowledge of seamanship to battle with the furious gales to which they may be at any time exposed when thus far away from shelter. Inducements to become fishermen are not wanting to this coast population. Nowhere are the best kinds of sea fish more abundant than in temperate and moderately high latitudes; and in this respect the British Islands are most advantageously situated, the sea surrounding them being frequented throughout the year by a variety of fishes always in request for the market, besides producing countless shoals of other kinds which only come within reach of the fishermen at particular seasons of the year. And great as may sometimes be the supply of fish during the continuance of favorable weather, it is rarely that the demand for it is exceeded at the present day; for all the markets of the country are brought within reach by the facilities provided for rapid transport from the fishing ports by the extensive system of coast and inland railways now in operation. Fishermen, therefore, always find a market for their produce; and although it is to be feared that many of them obtain but a small proportion of the price for which their fish is ultimately sold to the consumer, the majority of them are enabled to live more comfortably than formerly, and to save enough to keep their fishing gear in good working order, and in many cases to pay for improved and larger boats.

---

[1] For Coral, Pearl, Salmon, Sponge, and Whale Fisheries the reader is referred to those headings.

Fluctuation of fisheries.

There is no doubt that the fisheries fluctuate a good deal from year to year; and it is often the case that they may be good on one part of a coast when they are bad on another. The important herring fishery on the coasts of Scotland is a marked example of this, as must be familiar to all persons who have given any attention to the subject. Thus it not unfrequently happens that when the fishery on the east side is particularly successful, a scarcity occurs on the west coast or *vice versâ*. Again, in some years, the fish are equally abundant or scarce on both coasts. These fluctuations are observed in even small districts of a line of coast, and one part of a season may be good and another bad in the same locality. Precisely the same variations occur on all the coasts of the British Islands, and with all kinds of fishes. Undoubtedly, weather is one of the most important elements in the question of success; and a generally stormy season has a marked effect in the diminished quantity of fish landed. It tells both in reducing the number of fishermen at work, and in driving the fish from their usual haunts. It is only quite recently that attention has been directed to the subject of temperature as affecting the movements of certain fishes towards or from the surface of the sea, and this will be further noticed when we speak of the herring fisheries. Apparently trifling circumstances may in some cases materially affect the catch of fish. Thus the sean fishery for pilchards on the coast of Cornwall has fluctuated exceedingly during the last 50 or 60 years for which returns are in existence; but however abundant these fish may be on the coast, the seans cannot catch them unless the shoals come quite close to the land in localities where these nets can be worked. Enormous hauls of pilchards have been made in particular years, whilst in others the fishermen have waited week after week without a chance of wetting their nets, although the drift-net fishermen at some little distance from the land have been meeting with fair success. The large apparent element of chance in the success of our fisheries cannot be better expressed than by the general hope of the fishermen for "good luck."

Transport of fish.

Great changes have taken place in the fishing trade within the last 20 or 30 years, more especially in that for fish sent fresh to the market. Excluding herrings and cod, which to a great extent were consigned to the curer as soon as possible after they were caught, a large proportion of the fish formerly taken on our coasts was disposed of within a short distance of the place where it was landed. A good many turbot and soles were forwarded by light carts or coaches to the nearest railways as these gradually extended in different directions from London; but the people near the coast were, a generation or two ago, the principal consumers of fish, and the supply was comparatively scanty, for the fishing boats were small, and there was little inducement to fish on a large scale when the markets within reach were so few. All this has been completely changed, and the main agent in the work has been the great extension of railways throughout the length and breadth of the land. Next to railways as a means of facilitating the transit of fish to all the markets, the use of ice for packing the fish has become of great importance, so much so in fact that without its employment it would be impossible to carry on the North Sea trawl fishery during summer at the distance from land at which it is generally worked, and where some of the most productive grounds are situated. Its special importance in this fishery will be further noticed when we speak of the general system of beam-trawling; but we may here mention that without the use of ice a large proportion of the fish now sent long distances by railway would never reach their destination in a condition fit for the table. The idea of using ice in connection with the fish trade was first put into a practicable shape by Mr. Samuel Hewett. At the present time about 30,000 tons of ice are imported annually from Norway into Hull, which is only one of the large North Sea trawling stations, for the sole purpose of preserving fish, either on board the fishing smacks or during its transit to market. With the exception of herrings, pilchards, and sprats, a large proportion of the fish now caught on the English coast is put into ice almost as soon as taken out of the water. Much of it is at once so packed on board the trawlers; it is brought on shore sometimes after several days, and sold in the wholesale markets; it is then repacked in ice and forwarded to other markets, where it is purchased by the fishmongers, who have a stock of ice at home ready to receive it; and there it remains, if properly taken care of, till wanted, sufficient only to make an attractive display being laid out at one time for sale.

Use of ice in packing.

Continuance of supply of fish.

The question of how long our present large supply of sea fish is likely to continue is one of much interest, and the answer to it depends on whether or not our fisheries are carried on in such a manner as to cause more destruction of fish life than can be compensated for by the vast reproductive powers of those fishes which escape the nets and hooks of the fishermen. For more than fifty years past the cry has been periodically raised that our fisheries are being ruined. The general complaint has been of the wasteful destruction of spawn and very young fish by beam-trawling and sean nets; and in 1863 the outcry was so loud that a Royal Commission was appointed, not only to examine this question, but also to inquire into the general condition of all our sea fisheries,—the special objects of inquiry being the state of the supply of fish, and the questions whether the methods of fishing in use involved a wasteful destruction of fish or spawn, and whether existing fishery restrictions operated injuriously on the fisheries. On these points the commissioners, after taking evidence all round the British Islands, were enabled to give a very decided opinion. They reported that the supply of fish generally had largely increased, that the methods of fishing involved no waste of young fish that could be prevented without interfering with the general fisheries, that spawn was not destroyed by the nets, and that all fishery restrictions should be removed except such as were desirable for protecting and keeping order among the fishermen. The recommendations of the commissioners were embodied in an Act of Parliament known as The Sea Fisheries Act, 1868, by which, with one or two small exceptions relating to herring fishing on the west coast of Scotland, previous Fishery Acts were repealed, and fresh regulations made having reference to the registration of fishing boats, keeping order among drift-fishermen and beam-trawlers, and providing a close time for oysters in the English Channel. The main object of the Act was to carry out a convention between the British Islands and France, for the better ordering of the fisheries in the seas adjoining the two countries. The Act came into force in England on the 1st of February, 1869, but circumstances have hitherto prevented any date being fixed for carrying out the convention on the part of the French. Great advantage has undoubtedly been gained by British fishermen from the substitution of the present simple fishery regulations for the numerous Acts previously existing, many of which had long been obsolete; but the Royal Commission, which was issued virtually to inquire into the alleged destruction of fish spawn on the ground by beam-trawlers, would probably have never come into existence had the facts then been known which have since come to light about the spawning habits of most of our edible fishes. These facts are so important that a short notice of them may be given here.

Investigations as to place of spawning.

Fishermen are in the habit of asserting with perfect confidence that fishes of almost every kind they are accustomed to catch have certain grounds which they frequent at particular seasons for the purpose of depositing their ova. The herring is known to spawn on the ground,—at all events the spawn is found there in irregularly shaped lumps adhering to the bottom. It has therefore been concluded that all kinds of fishes have the same habits in this respect. Yet no one has been able to speak positively of having ever seen any fish spawn taken from the ground except that of the herring. Various soft and gelatinous substances are brought on shore by the sean nets, and commonly go by the name of spawn among the inshore fishermen; but that they are not fish spawn is perfectly well known to any one who has given attention to the variety of curious animal organisms inhabiting the sea.

It was stated by Professors Huxley and Allman in 1867, before the select committee of the House of Commons on the Sea Coast Fisheries (Ireland) Bill, as within their personal knowledge, that fish ova had been found floating at the surface of the sea, and that the ova they had met with were in all cases alive, and some of them in an advanced state of development. Reference was at the same time made to the observations then recently recorded by Norwegian naturalists on the spawning habits of the common cod, leading to the belief that spawning at the surface was by no means uncommon with our sea fishes. These investigations have been systematically carried on during the last ten years, under the direction of the Swedish Government, by Professor G. O. Sars of the university of Christiania, and have resulted in some unexpected discoveries. The seas in the neighborhood of the Loffoden Islands on the coast of Norway had long been known to be a great place of resort for cod during the spawning season; and in 1864 Professor Sars commenced his work there, and by means of a small surface towing net he obtained plenty of the ova of the common cod (*Gadus morrhua*) floating at the surface; examples in various stages of development were procured, the young fish were successfully hatched out, and the species identified beyond a doubt. Subsequent observations fully confirmed the accuracy of the conclusions previously arrived at that the cod spawn was not deposited on the ground but floated freely at or near the surface. In 1865 the same observations were made on the ova of the haddock (*Gadus æglefinus*), and it was satisfactorily proved that they went through all their stages of development while floating at the surface, in precisely the same manner as in the case of the cod. Sars was at first inclined to believe this development of the ova while floating was peculiar to the members of the *Gadidæ* or cod family, in its restricted sense; but in the summer of 1865 he visited the southern coast of Norway during the season for mackerel, and found abundant evidence of the same rule obtaining in that widely distinct fish. In the case of the mackerel, the spawning actually takes place at the surface; but with the cod family we believe the operation has not been so distinctly observed. The ova, however, are undoubtedly met with at the surface and at a short distance below it. Entirely subversive as these discoveries of Professor Sars are of the popular notions about fish-spawning, it is even more unexpected to find that both he and M. A. W. Malm of Gothenburg have independently ascertained that the ova of that essentially ground-fish the plaice (*Pleuronectes platessa*) follow the same rule of floating at the surface. Other kinds of floating ova were also obtained by Sars, some of which he succeeded in hatching; and he has completely identified the gurnard (*Trigla*) and the garfish (*Bellone*), in addition to those before mentioned. It is evident, then, that the floating of fish ova during the development of the embryo must be taken as the general rule in several large and distinct families of sea fish. Sars has pointed out that the development takes place at the bottom in the case of those fishes especially whose ova are cemented together by a glutinous secretion, or fastened in lumps to foreign bodies, such as Algæ, Hydroids, etc. He mentions as examples of this, among others, the herring (*Clupea*), the capelan (*Osmerus*), the species of *Cottus*, *Liparis*, etc.

It is particularly worthy of notice that, according to these observations of the Norwegian naturalists, all the important kinds of fish taken by our line fishermen and beam-trawlers, and the mackerel among such as are caught by the drift-nets, may be reasonably included among the species whose spawn floats at or near the surface of the sea, and their ova cannot therefore be liable to the slightest injury by any method of fishing which is carried on upon or near the ground. For if that be the rule with the spawn of the cod and haddock there can hardly be a doubt about its being so likewise with the ova of ling, coal-fish, whiting, pollack, hake, and that northern species, the tusk, all belonging to the same family. Again, turbot, holibut, brill, soles, plaice, dabs, and flounders are all closely allied, and there can scarcely be a doubt that the same rule applies to all which Sars and Malm have established in the case of the plaice, one of the most typical of this group of fishes. The gurnard family must also be included in this category; the spawn of the red mullet, we believe, has been observed floating in aquariums; and the dory, from its close affinity to the mackerel, may be expected to follow the same rule. On the other hand, we know that the spawn of the herring is commonly found at the bottom, although it by no means follows that the parent fish is there when the ova are excluded; for the full herring is frequently taken in drift nets which are very near the surface, and these nets are often covered with small lumps of spawn. At the same time the specific gravity of herring spawn is greater than water, and it sinks to the bottom sooner or later if nothing intercepts it. There is no evidence of its ever floating at or near the surface as is the case with that of the cod. In fact, the aggregation of the ova into masses of various sizes, and the glutinous substance in which the ova are embedded, by which they are enabled to adhere firmly to anything with which they may come in contact, point to their remaining in a fixed position during the process of development. It might have been anticipated that the other members of the herring family—the pilchard and sprat, for instance—would also have spawned on the ground, but, so far as we are aware, their ova have never been found there. Indeed, nothing is known of the spawning habits of the sprat, although this little fish has the roe well developed in December or January, when it is found in the greatest abundance on our coast, and comes nearest to the shore. The spawning of the pilchard is a matter of some little interest. The late Mr. Jonathan Couch, who probably devoted more time to the study of the habits of this fish than any other ichthyologist, states[1] his belief that the pilchard spawned at the surface, and the ova became mixed with a large quantity of tenacious mucus which spread out like a sheet on the water and kept them floating. If this should be confirmed, it will prove that even in the case of agglutinated masses of ova, development may naturally take place in them far away from the bottom. There appears to be little doubt that the pilchard spawns far out at sea, as they are on chance occasions taken in spawning condition in the mackerel drift-nets early in the year; and when, some months later, the shoals of pilchards approach the land the roe shows no signs of development. These circumstances favor the idea that pilchards are surface spawners, as believed by Mr. Couch.

Vitality of spawn.

There are several other kinds of edible fish of whose spawning habits we have no definite knowledge, but enough has been discovered of the habits of most of the fish which are valuable for the purposes of food, to show that there need be no anxiety about their spawn being destroyed by any of the methods of fishing in ordinary use. The only apparent exception to this statement is in the case of the herring, whose spawn it has been alleged has been destroyed by the beam-trawlers. But if the beam-trawlers wish to avoid tearing their nets in pieces, they must work where the ground is smooth; and in the few precise localities where it has been positively ascertained that the herring does spawn, the general character of the bottom is rough. That is the ground specially worked over by the line fishermen for haddock, cod, turbot, and other fishes, which come there in numbers for the sake of feeding on the herring spawn. There is a popular idea that all fish spawn is of a most delicate nature, and quickly loses its vitality if taken out of the water for a short time, or at all knocked about. This is probably true in those cases in which the ova are separated from each other after exclusion, and float freely in the water; but it is not so with the spawn of the herring, or probably of other fish whose ova are embedded in a tenacious mucus. The experiments of Professor Allman and of Dr. M'Bain have shown that herring spawn does not readily lose its vitality under rough treatment, and may even be hatched out after having been exposed to most unnatural conditions. Professor Allman states in his Report to the Board of Fisheries at Edinburgh that some stones covered with spawn were taken from the sea by divers on the 1st of March, 1862, not far from the Island of May. Some of this spawn was forwarded to him, and came into his possession after being kept in only a small quantity of water for two entire days. He says:—

---

[1] *History of British Fishes*, vol. iv. p. 81 (1865).

> "With the view of determining whether development would proceed in confinement, I placed some of this spawn in a glass jar with sea-water, exposing it in a window looking to the east. The several stages of development were regularly passed through, and on the 15th of March the embryo was fully formed, energetic movements were performed by it in the ovum, and it seemed ready to escape into the surrounding water. On the 16th some of the embryos had actually escaped, and were now about four-tenths of an inch in length. They were of crystalline transparency, and swam about with great activity, and with the remains of the yolk, reduced now to a very small volume, still adhering to them. The specific characters had, of course, not yet become established, and the little fish afforded no further evidence, beyond what we already possessed, to enable us to identify it with the young of the herring."

The young fish lived nearly a month in confinement, but the specific characters were not even then sufficiently perfected to identify the fish with certainty. There could be no reasonable doubt, however, that the spawn was that of the herring. After some account of other discoveries of spawn, he thus concludes his report:—

> "It was shown by these experiments that the vitality of the spawn was in no way injured by detaching it from the spawning bed, so that if it be returned to the sea before it suffers any prolonged exposure to the air, development will proceed apparently unchecked. Those specimens, indeed, which underwent development in my possession, had not only been removed from the ground, but had been kept for many hours in a scanty supply of water before I received them; and even after they came under my care, they were necessarily placed in conditions very different from those to which they would have been exposed if they had been allowed to remain in their natural habitat,—and yet, with all these disadvantages, development proceeded uninterruptedly."

Registration of vessels.

Registration of Fishing Vessels.—Under the Sea Fisheries Act, 1868, all vessels and boats engaged in fishing for the purpose of sale must be registered at the custom-house, and must be marked on the bow with letters denoting the port to which they belong, and their registered number. Thus, Grimsby is represented by the letters G Y, Peterhead by P D, and Galway by G. The fishing boats are divided into three classes,—the first class including everything of 15 tons and upwards, the second class all boats under 15 tons navigated otherwise than by oars only, that is, sometimes by sails and sometimes by oars, and the third class those with which oars only are used. The last class is supposed to include only small boats used for harbor fishing;[1] but as there are very few boats in which a sail of some kind is not sometimes hoisted, the customs have a discretionary power to put very small boats into the third class, notwithstanding their occasional use of a sail. The registers for each port are sent to the registrar-general of shipping, and appear in the annual returns published by the Board of Trade. There is great difficulty, however, in obtaining precise accuracy in the returns for many parts of the coast; new boats sometimes escape registration, and boats which have been lost or broken up sometimes remain for a year or so on the list. But, imperfect as these returns undoubtedly are, they are of some value in giving an approximate idea of the number of the fishing craft, and of the average size of those in the first class. It must be remembered, however, that this class includes boats ranging from 15 tons to 70 or 80 tons. The tendency now is to fish farther from the land than formerly, and to use decked instead of open boats; the result is that there is a steady increase in the first class boats, and a diminution in the number of the smaller ones. The preceding table gives the total number of fishing boats in England, Scotland, Ireland, and the Isle of Man on the register for 1876 and 1877, arranged according to their classes.

	Years.	First Class.		Second Class.	Third Class.
		Boats.	Tonnage.	Boats.	Boats.
England........	1876	3,142	121,445	8,777	2,890
	1877	3,425	137,768	7,825	2,044
Scotland.......	1876	2,782	47,743	9,888	1,470
	1877	2,940	51,039	9,326	1,303
Ireland.........	1876	393	9,364	2,802	2,949
	1877	405	9,861	2,817	3,002
Isle of Man...	1876	235	5,017	107	41
	1877	254	5,446	123	11
Totals........	1876	6,552	183,569	21,574	7,350
	1877	6,770	198,668	19,968	6,349

We will now proceed to give an account of the several valuable fisheries carried on around the coasts of the British Islands, with some details of the appliances in use, and the manner in which they are worked.

English Fisheries.

English Fisheries.—On the coast of England the methods of fishing in general use are more numerous than in the case of either Scotland or Ireland, the fishing-grounds are more extensive, and the total supply of fish obtained is larger and more varied in kind. The principal modes of fishing are by the beam-trawl, the drift-net, the sean, the stow-net, and lines. Their relative importance varies to some extent, but trawling and drift-net fishing occupy by far the most conspicuous positions, and lines come next in order.

Trawling.

Trawling.—The most characteristic mode of fishing is that known in England as "trawling," or in Scotland as "beam-trawling," and consists in towing, trailing, or trawling a flattened bag-net, often 100 feet long, over the bottom in such a manner as to catch those fish especially which naturally keep close to or upon the ground. It is very desirable that the name "trawl" should be restricted to this net, presently to be described, as much confusion has been caused by the practice, general in Scotland (which has misled even such writers as Mr. Couch, see *Fishes of the British Islands*, iv. 105), of applying the name to that very different kind of net which has for centuries past been almost universally known as the "sean," or "seine," or "seyne," and may be traced back through the Saxon *segne* to the Latin *sagena*, a sweep-net. In the United States and Canada the word "trawl" is still more misapplied, being given to what is in England commonly called the long line or bulter.

The beam-trawl.

The beam-trawl may be simply described as a triangular, flat, purse-shaped net, with the mouth extended by a horizontal wooden beam, which is raised a short distance from the ground by means of two iron frames or heads, one at each end, the upper part of the mouth being fastened to the beam, and the under portion dragging on the ground as the net is towed over the bottom. The beam, of course, varies in length according to the size of the net, and depends to some extent also on the length and power of the vessel which has to work it. In the large "smacks," as the trawl-boats have long been called, the beam ranges from 36 to 50 feet in length; and there is rarely anything less than this now used by the deep-sea trawlers. Elm is generally preferred for it, selected, if possible, from timber grown just of the proper thickness, that the natural strength of the wood may not be lessened by more trimming or chipping than is absolutely necessary. If the required length and thickness cannot be obtained in one piece, two or even three pieces are scarfed together, and the joints secured by iron bands. When the trawl is being hoisted in, the first part of the apparatus taken on board is the large heavy beam, and this is very commonly done when the vessel is rolling and pitching about in a seaway. It is therefore necessary for the sake of safety that the beam should be secured as soon as possible, and in such a position as to be out of the way and at the same time conveniently placed for lowering again when required. All this may be easily effected by having the beam of such a length in proportion to the size of the vessel that when hoisted up, one end of it may come over the taffrail, with the iron head just clear outside, and the fore end in front of one of the shrouds. It then lies on the gunwale of the vessel, and the ends are secured by ropes, the forerigging preventing that end of the beam coming on board, but the iron head passing in between the shrouds. The object or use of the beam is to extend the mouth of the net; but, in order to allow room for the fish to enter, the beam, and with it the back of the net which is laced to it, must be raised a certain distance from the ground. For this purpose the beam is fastened at each end to the top of an iron frame, shaped somewhat like an irregularly formed stirrup, which is fitted to it at right angles by a square socket at the top. By these "heads or irons" the beam is supported at a height of nearly 3 feet from the ground, and, contrary to the popular idea on the subject, never touches the bottom. It could only do so if the trawl were to reach the ground with its back undermost, and then the mouth of the net would close, and no fish could enter. The lower part of the trawl-head or iron is straight and flat, just like the corresponding part of a stirrup. It is called the "shoe," and is the part which slides over the ground as the trawl-beam and following-net are towed along. There is a slight variation in the form of the trawl-irons, and one, known as the Barking pattern, from having been adopted at that old trawling-station on the Thames, is shaped exactly like a stirrup; but generally the irons are preferred with the aft side straight. We now have the long beam supported at each end by a more or less stirrup-shaped iron fitted at right angles. The next thing to be considered is the net. This was previously spoken of as flattened and purse-shaped. When the net is spread out in the manner it would be when working, the upper part or back has its straight front edge fastened to the beam, but the corresponding lower part or belly is cut away in such a manner that the front margin forms a deep curve extending from the shoe of one trawl-head to the other, the centre of the curve or "bosom," as it is called, being at a considerable distance behind the beam. The usual rule in English trawls is for the distance between the beam and the bosom to be about the same as the length of the beam. In French trawls this distance is generally much less; but in all cases the beam and back of the net must pass over a considerable space of ground when the trawl is at work before the fish are disturbed by much of the lower margin of the net. This lower edge of the mouth of the trawl is fastened to and protected by the "ground-rope," which is made of an old hawser "rounded" or covered with small rope to keep it from chafing, and to make it heavier. The ends of the ground-rope are fastened at each side by a few turns round the back of the trawl-heads, just above the shoe, and the rope itself rests on the ground throughout its entire curve. The fish which may be disturbed by it have therefore no chance of escape at either the sides or back of the net, and as the outlet under the beam is a long way past them, and is steadily moving on, their fate is sooner or later decided by their passing over the ground-rope and finding their way into the funnel-shaped end of the net, from which a small valve of netting prevents their return. The ground-rope is the part which directly bears on the ground, and to prevent the possibility of the fish passing under it, the rope should have some weight in it so as to "bite" well, or press the ground closely. It is, however, always made of old material, so that it may break in case of getting foul of rocks or such other chance obstruction as may be met with on the generally smooth ground where the trawl can only be worked with advantage. If in such a contingency the rope were so strong and good as not to break, there would be serious danger of the tow-rope snapping, and then the whole apparatus might be lost; but the ground-rope giving way enables the net to be cleared and hauled up with probably no more damage to it than the broken rope and perhaps some torn netting. The remaining part of the trawl, extending from the bosom to the extreme end, forms a complete bag gradually diminishing in breadth to within about the last 10 feet, which part is called the "cod or purse," and is closed by a draw-rope or "cod-line" at the extremity when the net is being used. This is the general receptacle for the various fishes which enter the net; and when the trawl is hauled up and got on board the vessel, the draw-rope is cast off and the fish all fall out on the deck.

---

[1] By a recent order in council all open fishing boats which do not fish beyond three miles from land are exempted from registration. This practically abolishes the third class which has hitherto appeared in the returns.

The net.

Pockets.

We must now say a few words about the ingenious contrivances for preventing the escape of the fish which have entered the purse and reached the farthest extremity of the net. It has been mentioned that the body of the net tapers away to the entrance to the purse. It is at this point the opening of the pockets are placed; and they are so arranged that the fish having passed into the purse, and then seeking to escape by returning along its sides, are pretty sure to go into the pockets, which extend for a length of about 15 or 16 feet along the inner side of the body of the net, and there, the more they try to press forward, the more tightly they become packed, as the pockets gradually narrow away to nothing at their upper extremity. These pockets are not separate parts of the trawl, but are made by merely lacing together the back and belly of the net, beginning close to the margin or side nearly on a level with the bosom, and then carried on with slowly increasing breadth downwards as far as the entrance to the purse. At this point the breadth of the net is divided into three nearly equal spaces, the central one being the opening from the main body of the net into the purse, or general receptacle for the fish, which must all pass through it, and those on each side being the mouths of the pockets facing the opposite direction. The central passage has a valve or veil of netting called the "flapper," which only opens when the fish press against it on their way into the purse. To understand clearly the facilities offered to the fish to enter the pockets, it is necessary to remember that the trawl, when at work, is towed along, with just sufficient force to expand the net by the resistance of the water. But this resistance directly acts only on the interior of the body of the net between the pockets and then on the purse; it does not at first expand the pockets, but tends rather to flatten them, because they are virtually outside the general cavity of the trawl, and their openings face the further end of it. The water, however, which has expanded the body of the net, then passes through the flapper or valve, and enters the purse, which, being made with a much smaller mesh than the rest of the net, offers so much resistance that it cannot readily escape in that direction; return currents are consequently formed along the sides, and those currents open the mouths of the pockets, which, as before mentioned, are facing them; and the fish, in their endeavors to escape, and finding these openings, follow the course of the pockets until they can go no farther. The whole of the net is therefore well expanded, but it is so by the pressure of the water in one direction through the middle, and in the opposite direction at the sides or pockets.

Meshes.

The meshes of an ordinary deep-sea trawl vary in size in different parts of the net, diminishing from 4 inches square near the mouth to 1½ inches in the cod or purse. The under part of the net, being exposed to more wear and chafing than the upper, is usually made with rather stouter twine; and the purse, being especially liable to injury from being dragged over the ground with a weight of fish and perhaps stones in it, has some protection provided by layers of old netting called "rubbing pieces" laced to its under surface. The French fishermen frequently fasten a stout hide to this part of their trawls with the same object.

A deep-sea trawl, such as has now been described, is therefore an immense bag-net, the largest size being about 50 feet wide at the mouth and about 100 feet long. Many of these nets are much smaller, some of them not having the beam more than 36 feet or even less, and the net reduced in proportion; but there has been a great increase in the size of the trawl-vessels in recent years, and at the same time there has been an enlargement of the nets, although not quite in the same ratio. The trawl is towed over the ground by the trawl-warp, generally a 6-inch rope 150 fathoms long, and made up of two lengths of 75 fathoms each spliced together; one end of this warp is shackled to two other pieces each 15 fathoms long, and called the "spans or bridles," which lead one to each end of the beam, and are shackled to swivel-bolts in front of the iron heads so as to give a fair pull on the whole apparatus.

Size of trawl vessels.

The great development of the trawl fishery in recent years has led to a vast improvement in the kind of fishing vessels employed in it. Fifty years ago the only deep-sea trawlers were in the west of England, and from Barking on the Thames. They were not nearly the tonnage of many of the vessels now used in the North Sea, but were stout, heavy, seagoing craft of their size, and capable of standing almost any description of weather; and, although comfortable, they were certainly not very fast. At that date, however, the fish went into consumption at once, instead of being sent one or two hundred miles before it reached the consumer. The increased demand for fish of late years has led to the building of trawlers of the best description, as remarkable for their fast sailing as for other improved qualities. There is racing home now from the fishing grounds to catch the first of the market, and everything is done as quickly as possible to ensure quick distribution and delivery all over the country. The cost of the vessels has of course largely increased, not only from their greater size, but also because of the much higher price now paid for everything used in their construction. In 1862 a new trawl vessel, and what was at that time considered one of the larger class, could be built and fitted out ready for sea for £700 or £800; but it costs from

£1200 to £1300 to turn out one of the vessels now commonly used in the North Sea fishery. This includes a supply of everything necessary for fishing, costing about £70 or £80. A proper fit-out consists of a double set of almost every part of the gear, so as to provide against accidents, and generally to save the time which would be lost if the trawler were obliged to return to port before he had done a fair quantity of work. A trawl-net will perhaps last from two to four months, according to the nature of the ground worked upon; but during that time parts of it will have to be renewed. The back of the net, being exposed to the least wear, lasts the longest; the under part will generally require renewing twice, and the cod or purse five or six times, before the net is finally condemned. The additional size now given to the trawl-vessels has led to an alteration in the manner in which they are rigged. The term "smack" has been for a long time applied to those trading and fishing craft which were cutter rigged, and until quite recent years all the trawlers were known as trawl-smacks. It was a convenient rig; the single mast was stepped well forward so as to allow of a large and powerful mainsail, at the same time giving plenty of free space on deck for getting in the net, and stowing it and the long trawl-beam on the top of the bulwark when not at work. But when the size of the vessels was increased to 70 or 80 tons, it was found that the mainsail, enlarged in proportion, wanted a good deal more looking after in bad weather than was convenient, and the heavier main-boom caused a great deal of straining. More hands became necessary on this account than were required for ordinary fishing purposes, and the increased expenses interfered with profitable working. The new trawl-boats were therefore built of greater length, so as to provide room for a small second mast or mizen on which a gaff-sail could be carried, and thus something could be taken off the large mainsail. The result has been very satisfactory; just as much sail is carried as before, but it is not so lofty, and being divided into smaller pieces, it can be handled with greater ease and safety. As a gaff-sail is carried on the mizen, the rig is that of a ketch; had a lug-sail been used instead of a gaff-sail, the vessel would have been what is called "dandy-rigged." The increased length of the vessel in proportion to her size gives many advantages. Space is provided for packing away a considerable quantity of ice, which is a very necessary article in the present mode of working the North Sea trawl fishery; the produce of many fishing days can be properly stowed away and preserved in good condition, and the crew have more roomy and comfortable accommodation,—a point of importance, since at certain seasons they remain at sea for several weeks at a time.

Barking.

"Barking" the sails is a regular practice with the trawlers, as it is with most other fishermen in England and Scotland. The process consists in mopping them over with a composition of a solution of oak-bark, tar, grease, and ochre, which acts as a good preservative of the canvas. This is done once in six or eight weeks, and a suitable place is kept for the purpose at all the important fishing stations.

Working the trawl.

Working the beam-trawl requires some little skill which can only be acquired by experience at sea. A knowledge of the ground and of the direction and times of the tide is essential; for the trawl is towed with the stream, a little faster than it is running, so that there may be just sufficient resistance from the water to expand the net. If it were towed too fast, the pressure of the water against the long transverse beam would tend to lift it from the ground, and then the fish would not enter the net. This important point is regulated by a nice adjustment of the length of tow-rope to the force of the wind and state of the sea; and experience enables the fisherman to tell, by pressing the hand firmly on the warp between the vessel and the water, whether or not the trawl is working steadily over the ground. Lowering the trawl to the bottom is also a matter requiring great care, so that it may reach the ground with the beam above the iron heads and the ground-rope in its proper position below. This can only be managed by first getting the whole apparatus in a proper position at the surface, and then keeping the vessel slowly moving through the water whilst the lowering takes place. If, as sometimes happens in spite of all precautions, the net and beam should twist round while being lowered, and the apparatus should reach the bottom with its back downwards, then the beam would be on the ground and the iron supports above, the mouth of the net would close, and no good could be done with it. The only thing for the fishermen to do under such circumstances is to haul up the trawl and shoot it again. The popular idea that the beam is always dragging on the ground is therefore a mistaken one. The trawl is shot at the beginning of the tide, so that it may be towed for five or six hours, and during that time it will probably pass over from fifteen to twenty miles of ground. As trawlers when engaged in fishing are practically anchored by their trawls, they cannot readily get out of the way of vessels meeting them, and the law admits this view of the case by obliging them at night to carry a single mast-head light as an anchor light, instead of the regulation red and green side-lights for vessels under sail.

When the tide has finished, or the smack has reached the end of its fishing ground, the trawl is hauled up by a winch or capstan. This seldom takes less than three-quarters of an hour in fine weather, and two or three hours if it be rough. The beam is got alongside, and hoisted up and secured; then the net is gathered in, the cod or end of the bag being hoisted in by a tackle, and the cod rope closing the end being cast off, the whole catch of fish falls out on deck. The fish are immediately sorted and packed away, and the fishermen prepare for another haul, according to the state of the wind and tide.[1]

Varieties of trawl-fish.

Trawl-fish are separated for market purposes into two great classes, known respectively as "prime" and "offal." Prime includes turbot, brill, soles, dories, and red mullet, the last being caught in large numbers in summer, especially by the Brixham trawlers. Offal is the name given to plaice, haddocks, whiting, and other kinds of inferior fishes which are caught in great abundance, and usually sell at a low price. The term "offal" was applied to these fish at a time when railways had not come into existence, and purchasers frequently could not be found for the quantity of fish the trawlers would bring to market in one day. This was especially the case with plaice and haddocks when the newly discovered fishing grounds in the North Sea were first worked. A good deal of fish was then wasted, and thousands of haddocks were thrown overboard again as soon as caught, for the fishermen were under orders not to bring ashore more than were likely to be sold whilst fresh. Even in comparatively recent years trawled haddocks were of little value, until the practice of smoking them, as had long been done in Scotland, was adopted at Hull, Grimsby, and other places; and now not a haddock is thrown away if it is in good condition when landed. It may be mentioned that round-fish, such as haddock and whiting, always suffer more or less in appearance when caught by the trawl, as they are liable to be knocked about by the crowd of fish in the small end of the net, especially when the trawl is being hauled up. They do not therefore fetch a good price in the wholesale market, whilst haddock and whiting caught by the hook are always in demand, and it need hardly be mentioned that the Scotch haddock, so long famous for their excellence, both fresh and cured, are all caught with hook and line.

Trawling stations.

Plymouth.

The trawling stations in the west of England are Plymouth, and Brixham in Torbay, and this method of fishing has been carried on from both places for probably upwards of 100 years, although the date of its commencement has been by no means accurately ascertained.[2] It is certain, however, that at the beginning of the present century the trawlers were comparatively few, and not half the size of those now at work. Plymouth does not appear to have progressed so steadily in later years as Brixham, and this may be partly caused by the more frequent interruptions from bad weather at the western port. The south-westerly gales so common in

---

[1] Fuller details of the mode of working the beam-trawl will be found in *Deep Sea Fishing and Fishing Boats*, London, 1874.

[2] Froude, in his *History of England*, vol. xii. p. 397 (cabinet edition, 1870), speaks incidentally of trawlers at Brixham so long ago as the time of the Spanish Armada. In his description of the English attack on the Spanish fleet, he says:—"Drake, returning from the chase, came up with her [the "Capitana," the admiral's disabled ship] in the morning. She struck her flag, and he took her with him to Torbay, where he left her to the care of the Brixham fishermen. . . . The prize proved of unexpected value. Many casks of reals were found in her, and, infinitely more important, some tons of gunpowder, with which the 'Roebuck,' the swiftest trawler in the harbor, flew in pursuit of the fleet." The "Roebuck" is spoken of, in another account of the attack, as Sir Walter Raleigh's ship, and therefore, no doubt, an armed vessel; and we have been unable to find any evidence of there having been trawlers at Brixham at that date (1588).

Brixham.

winter are felt in all their violence on the fishing ground of Plymouth, and the heavy sea accompanying them sometimes puts a stop to fishing for two or three days at a time. The custom also at Plymouth of only fishing during the day and returning to harbor every evening must materially diminish the chances of the fishing being very profitable, and for some few years past the number of trawl vessels has not averaged more than about 60. At Brixham, where trawling is believed to have originated, and fishing has always been the chief industry, much more enterprise is shown. The trawlers there go to sea on Monday morning and remain at work till the next morning, when they return and land their fish. After an hour or so they again go off, and fish day and night till the next morning, and so on every day till Saturday comes, when, having landed their fish, they come to anchor, get their sails down, and spend the rest of the day in mending their nets and putting everything in order for the next week's work. Sunday is a day of rest for all hands.

The history of the Brixham fishery has a very important bearing on the charges that have been brought against the trawlers of destroying spawn and very young fish, and of gradually exhausting the fishing grounds on which they worked. The Brixham men, as a rule, keep to a particular stretch of fishing ground, extending from the Start Point, past Torbay, towards the neighborhood of Portland,—practically about twenty miles long and of variable breadth, but mostly from three to eight miles off the land. There is no record of how many trawlers there were at Brixham at the beginning of this century, but it is known that they were few and less than half their present size. In 1852, however, there were 70 of them, 85 in 1863, and in 1872 their number was about 100, besides 20 others which worked on this home ground during the winter; and new vessels are being built every year, not only to make up for losses, but to add to the fleet. This small strip of fishing ground has certainly been worked for more than a hundred years, the fishing smacks have been steadily increasing in number and have more than doubled in size, and yet there is no sign of the ground becoming exhausted. The greater demand for fish has no doubt encouraged the fishermen in their work, for they have obtained better prices for their fish; but if the effects of trawling were the exhaustion of the fishing ground, the Brixham fishery should have come to an end many years ago. It has, however, never been so prosperous as during the last few years. Every one at Brixham is more or less interested in the success of the fishing; the actual condition of the fishery is generally understood, and the savings of the fishermen and many of the trades-people of the place are invested in it year after year. The trawlers do not work for weekly wages, but on the share principle, and the master is generally owner or part-owner of the vessel. It is consequently the interest of every one on board to do his best to make a successful fishing, and the fact of the owner being in command insures due attention to economy in working, so that, whilst no necessary expense is spared in keeping the sails and gear in proper order, everything is made to last as long as possible.

Hull.

Brixham has been long considered the "mother-port" of the trawlers, the place where the system of beam-trawling originated; but although Barking, once famous as a fishing station, disputes the honor with her, there is no doubt that Brixham men have led the way in developing this particular method of fishing to its present large proportions. More than forty years ago some of the Brixham vessels went to Ramsgate and fished the grounds at that end of the Channel. Others joined them and permanently settled there, and now there are upwards of 160 sea-going trawlers belonging to the port. Ten years later Hull was colonized from Brixham and Ramsgate, and Grimsby from Hull at a subsequent period; whilst as early as 1818, Brixham smacks and fishermen passed over to Dublin to commence deep-sea trawling in Irish waters. The important rise of Hull as a trawling station dates from 1845, soon after the discovery of the famous Silver Pit, at the south end of the Dogger Bank. Before that time the number of North Sea trawlers was very small; they were only of about half the size of most of the smacks at present; and not enough was known of the fishing grounds to tempt the fishermen so far from land in vessels of such little power. For a long time, however, the line fishery for cod and haddock had been carried on in the neighborhood of the Dogger, but in vessels specially constructed for the purpose. The Great Silver Pit, so called to distinguish it from a smaller Silver Pit much nearer the land, was first worked over during a very severe winter,—we believe, in 1843. Two fishing grounds called the Well Bank and Botany Gut had been explored and discovered to be very productive; and between them and the Dogger, and bearing true east from Flamborough Head, the Admiralty chart showed a bed of deeper soundings, ranging in some parts from 30 to 40 fathoms, and the whole extending for about sixty miles east and west, and from six to ten miles in breadth. The patch was marked "Outer Silver Pit," and on trying it with the trawl, in the deeper parts at the western end and near the middle, soles were found during that very cold season in almost incredible numbers; the nets were hauled up bristling with fish trying to escape through the meshes, and such enormous catches were made as the most experienced fishermen had never before thought possible. Of course it was not long before this remarkable discovery became known, and a migration of trawlers from Brixham and Ramsgate soon took place to Hull as a convenient station from which to work on this promising ground. With the breaking up of the cold weather, however, this extraordinary congregation of soles became dispersed; but more attention was from that time directed to the North Sea fishing generally, and in after years the Silver Pit has again been found very productive whenever the winter has been very severe, or, as the trawlers call it, in "pit seasons." The fact of temperature affecting the distribution of many kinds of fish, shown in such a marked manner in this particular case, is now receiving systematic attention from the Meteorological Society of Scotland in connection with the herring fisheries, and very important results have apparently been obtained from an inquiry into the same subject on the coasts of Nova Scotia.

Grimsby.

The value of the North Sea fishery soon became established, and nothing in the history of our sea fisheries is more remarkable than the rapid but steady development of the system of trawling which has taken place from the Humber ports. The Hull trawlers were 40 in 1845, and most of these were arrivals from the Channel ports, as previously mentioned; but in 1863 they had increased to 270, and in 1877 there were 440 first-class fishing craft, with an aggregate of 26,310 tons, on the Hull register,—these, excepting a few shrimping boats just over 15 tons each, being all trawl-smacks. Another port on the Humber, Great Grimsby, situated nearer the entrance of the river, has made still greater progress. It had for some years been known in connection with the North Sea cod fishery; and the practice of bringing home the cod alive in welled vessels, and keeping them so till they were wanted for the market, led to the selection of Grimsby, rather than the more important town of Hull, as better suited, on account of the greater purity of the salt water, for preserving the cod in good condition in the floating store chests; and the extension of the Manchester, Sheffield, and Lincolnshire railway to the port provided the facilities for sending away the fish to the various inland markets. In 1858, when the railway was nearly completed, five of the Hull trawlers made Grimsby their head-quarters, and in the following year the line was opened to the town. The advantages of the port at once became evident, and the trawlers rapidly increased from 5 in 1858 to 70 in 1863; in 1872, only nine years later, the number was 248, and there were 82 cod smacks besides. In the return by the Board of Trade of the first-class fishing craft registered at Grimsby for 1877, the number of vessels, including trawlers, cod-smacks, and a few smaller craft engaged in procuring whelks for cod-bait, is officially stated as 505, with an aggregate of 29,924 tons, new measurement, which is more than one-third less than that known as builder's measurement. This gives an average of over 59 tons; but many of these vessels are 70 tons, and even more.

By the courtesy of Mr. Reed, the dock-master at Grimsby, we are enabled to give the following return of the quantity of fish sent away by rail from that town in each of the years from 1856 to 1877:—

Years.	Tons.	Years.	Tons.	Years.	Tons.
1856	1,514	1864	11,198	1871	30,857
1857	3,435	1865	13,368	1872	31,193
1858	4,344	1866	15,692	1873	34,876
1859	4,742	1867	19,416	1874	35,134
1860	4,842	1868	21,621	1875	34.881
1861	5,371	1869	24,140	1876	40,185
1862	8,521	1870	26,324	1877	44,376
1863	9,408				

The only break in this increasing series is in 1875, and is readily explained by the fact the herring fishery in that year was a very bad one, and that instead of about 4000 tons of herrings being then landed from Lowestoft and other boats at Grimsby, as had been the case for some few years previously, the quantity was very much smaller. Great, however, as has been the increase of fish sent away by rail from Grimsby, especially during the last two years, the returns above given do not represent all the fish landed at the fish-wharf; for a new trade to the Continent has lately sprung up, and fresh fish is exported direct to the following places, the returns being given for the two years in which this trade has been carried on:—

	Year.	Tons.	Year.	Tons.
Hamburg	1876	21	1877	111
Rotterdam................	"	1639	"	2683
Antwerp..................	"	735	"	911

It must be remembered that this great increase of the Grimsby trawl fishery has not been at the expense of Hull and other trawling stations, for, except at Plymouth, where, owing to local causes, the number of trawlers has remained about the same for several years, the others have also more or less largely added to their fleets. Grimsby is indeed comparatively new as a fishing station, but it is fast outgrowing in this particular trade the conveniences which, at the time they were provided, were thought ample for anything that would be required. A special dock of 12 acres in extent was constructed for the use of the fishing vessels; another of 11 acres has lately been finished, as well as a graving dock capable of holding ten smacks at a time. The fish are all landed on a covered pontoon 828 feet long and 48 feet wide; but so crowded has this landing wharf become, that an addition to it is likely to be made. Ice companies have also been established, with steamers of their own constantly bringing ice from Norway for the use of the fisheries. This is largely employed in packing the fish for transit by rail inland; but ice now also forms part of the regular fit-out of the trawlers, more particularly from September to May, when, there generally being plenty of wind, each vessel brings back its own catch of fish. An air-tight compartment is fitted in the hold of the vessel, called the "ice-box," in which from two to four tons of Norwegian ice are placed when she starts on her trip, or "voyage," as it is usually called. As the fish are caught they are stowed away below in bulk, with broken ice between the layers, and this is continued till a good quantity of fish has been collected. Then the vessel returns to port, after an absence of perhaps ten or fourteen days. The fish are taken out loose and put up to auction, the buyers finding the packages; in these the fish are packed with a sprinkling of crushed ice again between the layers, and an extra quantity at the top, which is covered with straw and tied down. From May to September, however, when light winds prevail, a different system is adopted, and the vessels fish in fleets of from twenty to fifty together. Their fish are collected every day by carriers, either steamers or fast-sailing cutters, which receive what each vessel has to send in, and with it a consignment note, or "pot-list," to the wholesale dealer, who has to sell it as soon as it reaches the market. All the fish are packed in ice as before, and are repacked in ice when sent away to the fishmonger, who keeps them under the same cooling influence till almost the moment of sale to the consumer; so that from first to last the value of ice in the trawl fishery is almost incalculable. Without this material the supply of trawl fish in a wholesome condition for food would not be a tenth of what it is now, the price would be infinitely greater, and the various trades benefiting by the trawling system would not be in such a thriving condition as is now the case. The public of course do not get their fish so fresh from the sea as formerly, and there is sometimes a want of flavor about it which is undoubtedly due to long icing; but if the fish be cooked as soon as taken from the ice, it is still wholesome and generally palatable food.

Besides the trawling stations we have more particularly mentioned, Great Yarmouth is of some importance, as, in addition to a considerable fleet of trawlers belonging to the place, many of the Barking smacks also fish from that port; but after what has been already said, there is nothing special to add regarding the trawling from Yarmouth, Lowestoft, Barking, Ramsgate, and some smaller stations.

Steam-trawling.

Steam-trawling.—An endeavor is now being made on a tolerably large scale to utilize steam in deep-sea trawling. The experiment is not altogether new, it having been tried on the Devonshire coast a few years ago, but without success; for, although steam answered perfectly well in towing the trawl, and saved an immense deal of labor in hauling up the net, and time in going to and returning from the fishing ground, it was found that the expenses were too heavy. About five years ago a steam cutter fish-carrying company was started at Yarmouth, with the intention of using the vessels for either trawling or taking the fish to market; but it appears to have been soon found that it did not pay to use the steam for trawling, and that the vessels would be more profitably employed in the carrying trade. The steam-trawling now being worked is from Shields; and the fact is worthy of note, for it was along this particular part of the east coast—from Sunderland northwards—that the complaints against trawling were so loud in 1863, that the royal commission of that year was appointed to inquire into the working of the trawl system, and they commenced their inquiry at Cullercoats, only three miles north of the present headquarters of steam-trawling. In 1877 it appears that trawling was tried with one or two steam-tugs, which, owing to the badness of the shipping trade, had very little to do; and it was found to be so successful that others fitted out for the same work, until about forty were engaged steadily in this fishery whenever there was nothing to keep them at home. The latest information is that other more suitable vessels are about to begin, and that by way of further experiment fast steamers are to be employed to collect the fish from the trawlers, which will take it to London, it is calculated, in about twenty hours. The best ground fished by these steam-trawlers is said to be north of Newbiggen, and at some little distance from the land. Very fine soles are reported to be taken there, and no doubt the character that part of the coast formerly had for turbot has not been entirely lost. The chief grievance of the Newbiggen fishermen in connection with this trawling is that their long lines are interfered with; but as they are in the habit of setting their lines, and then leaving them all night to take care of themselves, they can have no just or legal cause of complaint against fishermen who are working another method of fishing in the same neighborhood, and who have no means of finding out where the lines are after it has become dark. It is well-established law that no one can be held responsible for the loss of fishing gear in the open sea if the owners leave it unguarded.

Trawling grounds.

With regard to trawling grounds, those hitherto worked in the North Sea are principally on the Norfolk and Lincolnshire coasts for the home fishing, whilst the off grounds are about the southern part of the Dogger, and towards the Dutch coast.[1] Some localities are famous for haddocks, others for plaice, while soles are abundant on particular grounds. But there are seasons for each locality when the fish frequenting them become more numerous there. There is good trawling also to be had off Hastings, on the Diamond grounds, as well as on the Varne and the Ridge in mid-channel, and from the North Foreland far into the North Sea. On the western side of England, the Liverpool and Fleetwood trawlers work according to the season between the Isle of Man and the English coast, sometimes going into Carnarvon and Cardigan bays; and the Tenby ground is fished by smacks belonging to Tenby, and by several from Brixham during the summer months.

Number of trawlers.

The number of sea-going trawlers now working on the English coasts cannot be less than between 1700 and 1800, and of these upwards of 1300 regularly fish in the North Sea. Taking a low average of five hands to each vessel, we have nearly 9000 men and boys engaged in this fishery, and trained to a regular sailor's life.

Drift fisheries.

Drift Fisheries.—The next in importance to trawling among the English fisheries is that carried on with drift-nets for mackerel, herrings, and pilchards. It is undoubtedly the most common method of net-fishing on the coasts of the British Islands, but nowhere is it so general as in Scotland. There are, however, some considerable drift-fisheries on the eastern and southern coasts of England, and the important mackerel fishery is mainly at the western end of the Channel. The value of that mode of fishing, technically known as "drifting or driving," will be understood when it is remembered that it is the only method by which such fishes as herrings, mackerel, and pilchards, which generally swim at or near the surface, can be readily caught in the open sea, at any distance from the land, and in any depth of water, so long as there is sufficient for the floating of the nets in the proper position. The term "drift-net" is derived from the manner in which the nets are worked. They are neither fixed nor towed within any precise limits of water, but are cast out or "shot" at any distance from the land where there are signs of fish, and are allowed to drift in whichever direction the tide may happen to take them, until it is thought desirable to haul them in. The essential principle of the working of the drift-net is that it forms a long wall or barrier of netting hanging for a few fathoms perpendicularly in the water, but extending for a great length horizontally, and that the fish, meeting these nets and trying to pass them, become meshed; they force their heads and gill-covers through the meshes, but can go no farther; and as the gill-covers catch in the sides of the mesh, the fish are unable to withdraw and escape. Whether it be mackerel, herring, or pilchard, the manner in which the net works is the same; the variations which exist relate only to the difference in habits and size of the fish sought after.

Yarmouth herring fishery.

We will first speak of the Yarmouth herring fishery, one of the most important English drift fisheries, and the one of which we have the oldest records. The thriving town of Great Yarmouth in Norfolk is said to have been the resort of fishermen during the herring season as early as the 6th century, and there is no reason for believing that the fishery with which its name has been so long associated was ever carried on by any other method than drift-nets, as at the present day. An immense deal of information about the early records of the herring fishing at Yarmouth and other places has been compiled and published by Mitchell in his book on *The Herring*,[1] and to him we must refer our readers for numerous historical details on the subject; but we may mention that, according to authorities quoted by him, Yarmouth was erected into a burgh by Henry I. in 1108, the annual payment for this privilege being "ten milliers of herrings." The fishery was then evidently recognized as being well established, and herrings as the special trade of the town. A quaintly written account also of the origin of Yarmouth, as given by Manship (who wrote in 1619), is quoted in the following note by Swinden[2] in his history of the town:—

---

[1] The great increase of large trawlers within the last few years has naturally led to a more extended field of work, and many of them now go much further to sea than formerly.

> "And now by pregnant probabilities, it is my opinion very clear, that from the landing of Cerdick (one of the Saxon adventurers) in anno 495, now 1124 years past, this sand, by the defluxion of tides, did by little and little lift its head above the waters; and so in short time after, sundry fishermen, as well of this kingdom, viz.: of the Five Ports (being then the principal fishermen of England), as also of France, Flanders, and the Low Countries, yearly about the feast of St. Michael the Archangel, resorted thither, where they continued in tents, made for the purpose, by the space of forty days, about the killing, trimming, salting, and selling of herrings, to all that thither came for that purpose; whereunto did resort the merchants of London, Norwich, and other places to buy herrings during the season, and then departed; as those fishermen who kill fish at Wardhouse use to do at this present. So in short time after, as that sand became firm land, and that thereby traffic began more and more to be increased, men finding the same to be a commodious place to dwell and inhabit in, did for that purpose gather themselves together, to have a continual residence therein, and began to build houses, of which came streets, and of those streets this flourishing township."
